A typical MSWLF is a constantly evolving facility which is constructed over its operating life as received wastes are spread, compacted, and covered. Most modern landfills contain one or more separate "units," planned final waste containment areas. Active units continue to receive wastes until they have reached disposal capacity. When capacity is reached, a unit is capped with a final cover, and additional wastes must be placed in other active units. As a result, a landfill may consist of multiple inactive and active units at various stages of completion.

Within each unit, wastes are added in layers referred to as lifts. Received wastes are spread across the working face of the landfill to a depth of six to twenty feet and then compacted. At the end of each working day a thin layer of soil (daily cover) is spread on top of the added wastes and compacted. A large unit may consist of multiple lifts, depending on the planned final depth.

Historically, landfills have been constructed according to one of two generic designs, the trench method and the area method, or a combination of these. The trench method requires the excavation of a trench into which wastes will be placed. Soil from the excavation provides the cover material as disposal continues. In the area method, wastes are placed directly on

the ground surface and disposal follows the natural contours of the land. Some landfills use combinations of the two methods at different times depending on the location of the active unit.

MSWLF construction creates constant changes in the contours of the facility resulting in changing patterns of storm water runoff and runoff. Controlling erosion of landfill slopes is among the primary concerns of the landfill operator. Current practices generally include a combination of temporary controls (straw bales, silt fences, etc.), in active disposal areas, and permanent controls (recontouring, revegetation, etc.), in areas where waste disposal has been completed.

Daily and intermediate covers serve primarily to protect against disease vectors and to prevent fires and the blowing of refuse. Typically, daily covers consist of the minimum amount of soil excavated from the site needed to cover exposed wastes in the active areas of the landfill. After spreading, the cover is usually compacted to reduce loss from erosion. Intermediate covers, which are also typically soil excavated from the site, are often applied to areas of a unit which will be inactive for periods of 30 days or more. Deeper than daily covers, intermediate covers may be applied in conjunction with runoff control measures to minimize pooling and high-velocity flow patterns. Both daily and intermediate covers promote infiltration to some extent, depending on depth and soil material.

When a landfill (or landfill unit) has reached disposal capacity, a final cover is applied. Final covers generally provide a relatively impermeable cap over which topsoil is placed and vegetation is established. Permanent runoff controls (diversion channels, recontouring, terracing, etc.) may be constructed to minimize erosion and ponding. Final cover materials in older landfills, which are generally subject to limited regulatory requirements, often consist of a single layer of natural soils. However, at newer landfills subject to more stringent regulatory requirements, other cover materials (polymers, sand and gravel, sewage sludge, etc.) are frequently combined with soil in multiple layers.¹⁰⁵

b. Industrial landfills. Industrial landfills only receive wastes from industrial facilities such as factories, processing plants, and manufacturing sites. These facilities may also receive hazardous wastes from very small

quantity hazardous waste generators (less than 100 kilograms per month), as defined in RCRA Subtitle C. Included in these waste streams are some PCB-contaminated wastes. The Toxic Substances Control Act PCB disposal regulations allow limited categories of PCB materials to be disposed of in RCRA Subtitle D landfills.¹⁰⁶ In 1988, EPA estimated that there were at least 3,511 industrial Subtitle D landfills (this would presumably be the maximum number of non-MSWLF facilities regulated by the storm water program). The specific number of these units that are onsite and offsite facilities (i.e., centralized waste management units) was not available. Because wastes generated by industrial facilities vary considerably, both between and within industries, the wastes disposed of at industrial landfills can be highly variable. For example, the industrial nonhazardous waste category includes wastes from the pulp and paper industry, the organic chemical industry, the textile manufacturing industry, and a variety of other industries. Consequently, these waste streams may vary in chemical composition and/or physical form. Most industrial landfills are privately owned.¹⁰⁷

Currently, there are limited data available on industrial landfills. Specific industrial waste streams have not been well characterized and little is known about the hazards they may pose. Limited data are also available regarding the design, operation, and location of these facilities. It has been documented, however, that there has been only sporadic application of design and operating controls at industrial landfills. In 1988, only about 12 percent of industrial landfills (including both onsite and offsite facilities) had any type of liner, and fewer than 35 percent employed runoff controls.¹⁰⁸ The use of these controls (including runoff and runoff controls) at industrial waste landfills is likely to increase as State industrial waste programs continue to evolve.

c. Land application sites. In 1988, EPA estimated that there were approximately 5,605 land application sites in the U.S. These sites receive wastes (primarily wastewaters and sludges) from facilities in virtually every major industrial category. More than half of all land application sites cover less than 50 acres and receive less than 50 tons of waste annually. The largest number of active land application sites

in 1988 were observed in the food and kindred products industry, however the pulp and paper industry managed the largest gross quantity of waste using this practice. Similar to landfills, the variability in types of waste that are land applied precludes any general characterization of the materials that may be exposed to storm water. Typically, individual land applications will only dispose of wastes with specific characteristics. However, the criteria for selection are site-specific depending on type of process used and the soil characteristics. Waste application techniques are dependent on waste characteristics.

In 1988, EPA found that 68.5 percent of all industrial waste land application units had runoff and runoff controls. No information was available on the extent of closure requirements applicable to land application units.

2. Potential Pollutant Sources at Landfill and Land Application Sites

a. Landfills. At landfill sites, runoff carrying suspended sediments and commingling of runoff with uncontrolled leachate are the two primary sources of pollutants that this section is intended to address. Other potential sources of pollutants at landfills, those from ancillary areas of the landfill and which are not directly associated with landfill activities (i.e., vehicle maintenance, truck washing, composting, transfer station activities, etc.) may be subject to requirements in other sections of today's proposed permit.

(1) Total suspended solids. Storm water discharges from landfill sites often contain high TSS levels because of the extensive land disturbance activities associated with landfill operations. Suspended solids can adversely affect fisheries by covering the bottom of a stream or lake with a blanket of material that destroys the fish food bottom fauna or spawning grounds. In addition, while they remain in suspension, suspended solids can increase turbidity, reduce light penetration, and impair the photosynthetic activity of aquatic plants.¹⁰⁹ Specific sources of TSS loadings from landfill operations and typical Best Management Practices (BMPs) used to control TSS levels in storm water runoff are shown in Table L-1. The listed BMPs are consistent with the BMPs identified in part 1 of the permit applications submitted by landfill group applicants.

TABLE L-1.—SOURCES OF TSS LOADINGS AND TYPICAL BMPs USED FOR EROSION CONTROL AT LANDFILLS

| Potential pollutant sources | BMPs |
|---|--|
| Erosion from: <ul style="list-style-type: none"> • Exposed soil from excavating cells/trenches. • Exposed stockpiles of cover materials. • Inactive cells with final cover but not yet finally stabilized. • Daily or intermediate cover placed on cells or trenches. | Stabilize soils with temporary seeding, mulching, and geotextiles; leave vegetative filter strips along streams. Implement structural controls such as dikes, swales, silt fences, filter berms, sediment traps and ponds, outlet protection, pipe slope drains, check dams, and terraces to convey runoff, to divert storm water flows away from areas susceptible to erosion, and to prevent sediments from entering water bodies. Frequently inspect all stabilization and structural erosion control measures and perform all necessary maintenance and repairs. |
| Erosion from haul roads (including vehicle tracking of sediments). | Stabilize haul roads and entrances to landfill with gravel or stone. Construct vegetated swales along road. Clean wheels and body of trucks or other equipment as necessary to minimize sediment tracking (but contain any wash waters [process wastewaters]). Frequently inspect all stabilization and structural erosion control measures and perform all necessary maintenance and repairs. |

Landfill group applicants were required to submit storm water sampling data under part 2 of their group applications. There were a total of 1,410 facilities in the landfill group applications. Part 2 data revealed that TSS concentrations were extremely variable. Statistically summarized part 2 data indicated a wide range of TSS concentrations ranging from 0 mg/L to 39,900 mg/L for grab samples, with a

mean of 2,978 mg/L. For statistically summarized part 2 composite samples, the concentrations ranged between 0 mg/L and 18,220 mg/L, with a mean of 1,850 mg/L. Additional part 2 data fell within the ranges, and generally below the mean concentrations, that are stated above.

(2) *Other pollutants.* Table L-2 presents potential sources of other pollutants in storm water discharges

from landfill operations. The specific pollutants associated with each of these sources are highly variable, depending upon individual site operations and waste types received. Table L-2 also lists BMPs that would be expected to be used in these areas to minimize potential pollutant loadings. Several of these BMPs were identified in the group permit applications submitted by landfill operators.

TABLE L-2.—SOURCES AND BMP CONTROLS OF POTENTIAL POLLUTANTS (OTHER THAN TSS)

| Potential pollutant source | BMPs |
|---|---|
| Application of fertilizers, pesticides, and herbicides. | Observe all applicable Federal, State, and local regulations when using these products. Strictly follow recommended application rates and methods (i.e., do not apply in excess of vegetative requirements). Have materials such as absorbent pads easily accessible to clean up spills. |
| Exposure of chemical material storage areas to precipitation (including pesticides, fertilizers, and herbicides). | Provide barriers such as dikes to contain spills. Provide cover for outside storage areas. |
| Exposure of waste at open face | Have materials such as absorbent pads easily accessible to clean up spills. Minimize the area of exposed open face as much as is practicable. Divert flows around open face using structural measures such as dikes, berms, swales, and pipe slope drains. |
| Waste tracking onsite and haul roads, solids transport on wheels and exterior of trucks or other equipment (common with incinerator ash). | Frequently inspect erosion and sedimentation controls. Clean wheels and exterior of trucks or other equipment as necessary to minimize waste tracking (but contain any wash waters [process wastewaters]). |
| Uncontrolled leachate (commingling of leachate with runoff or runoff). | Frequently inspect leachate collection system and landfill for leachate leaks. Maintain landfill cover and vegetation. Maintain leachate collection system. |

Table L-3 summarizes the group applicant data that was analyzed for the seven conventional and nonconventional pollutants (other than TSS) required to be sampled for by all landfills submitting part 2 data. Similar to the results for TSS described above, these data indicate that there was great variability in pollutant concentrations at the various landfills. Generally,

pollutant concentrations for BOD₅, COD, Nitrate plus Nitrite Nitrogen, TKN, and pH exhibit variability with the minimum and maximum reported concentrations, often ranging over several orders of magnitude. As shown in Table L-3, the concentrations of these constituents are generally low in comparison to discharges from other sectors. Elevated levels of these

pollutants would not be anticipated in runoff from waste management units unless there was direct contact with waste materials and/or commingling with leachate. Additional part 2 information received is generally consistent with the values reported below.

TABLE L-3.—SUMMARY OF LANDFILL/LAND APPLICATION SITE STORM WATER DATA (EXCEPT TSS)

| Parameter | Data summary | |
|----------------------------------|--|---|
| | Grab samples | Composite samples |
| BOD ₅ | 78% of BOD levels 10 mg/L or less | 73% of BOD levels 10 mg/L or less. |
| COD | 78% of COD levels less than 100 mg/L | 77% of COD levels less than 100 mg/L. |
| Nitrate plus Nitrite Nitrogen .. | 71% of nitrate plus nitrogen levels one mg/L or less | 65% of nitrate plus nitrogen levels less than 1 mg/L. |
| Nitrogen, Total Kjeldahl | 74% of TKN levels less than 2 mg/L | 85% of TKN levels less than 2 mg/L. |
| Oil and Grease | 83% of Oil and Grease levels 5 mg/L or less | Not Applicable. |
| pH | 96% of pH levels between 6.49 and 8.88 | 96% of pH levels between 6.49 and 8.88. |
| Total Phosphorus | 85% of phosphorus levels less than 2 mg/L | 75% of phosphorus levels less than 2 mg/L. |

Only two groups submitted sampling for toxic pollutants expected to be present in their storm water discharges. Data were submitted for five facilities. These data are evaluated and summarized in Table L-4. While the data suggest that some toxic pollutants

could be present (at highly variable levels) in storm water discharges from landfills, the amount of data is inadequate to be considered representative of storm water discharges from landfill sites. In addition, there is little or no additional data available

from other sources to characterize the levels of toxic pollutants in discharges of runoff from industrial and municipal solid waste landfills. Additional part 2 data for toxic pollutants were within the grab sample ranges listed in Table L-4.

TABLE L-4.—SUMMARY OF TOXIC POLLUTANT GRAB SAMPLING DATA
[Data submitted by only two groups]

| Parameter | Grab samples | | | | Composite samples | | | |
|----------------|------------------|-----------------|--------------------|--------------|-------------------|-----------------|--------------------|--------------|
| | Number of groups | Number of sites | Number of outfalls | Range (mg/L) | Number of groups | Number of sites | Number of outfalls | Range (mg/L) |
| Ammonia | 1 | 4 | 7 | .4-160 | 1 | 2 | 3 | .17-.29 |
| Arsenic | 2 | 4 | 4 | .006-9.49 | 1 | 2 | 3 | .05-.09 |
| Barium | 2 | 4 | 7 | .065-2.14 | 1 | 2 | 3 | .21-.32 |
| Cadmium | 1 | 1 | 1 | 0.845 | 1 | 1 | 1 | 0 |
| Chromium | 1 | 4 | 8 | .006-.204 | 0 | 0 | 0 | N/A |
| Iron | 2 | 5 | 8 | .036-210 | 1 | 2 | 3 | 49.6-90.5 |
| Lead | 1 | 4 | 6 | .079-83.7 | 1 | 2 | 3 | .02 |
| Mercury | 2 | 4 | 5 | .0002-61.5 | 0 | 0 | 0 | N/A |
| Selenium | 1 | 3 | 4 | .005-16.5 | 0 | 0 | 0 | N/A |
| Silver | 1 | 1 | 1 | .006 | 0 | 0 | 0 | N/A |
| TOC | 2 | 5 | 7 | .54-128 | 0 | 0 | 0 | N/A |

b. Land application sites. At land application sites, TSS would also be expected to be found at elevated levels in storm water discharges (because of the extensive soil disturbance). The occurrence and levels of other pollutants in storm water discharges are dependent on the types of wastes applied and facility design and operation (including use of storm water management/treatment practices. No part 2 data for TSS or any other pollutants was submitted for land application sites nor was such data available from other sources.

There are no Federal criteria for industrial landfill or land application unit design, operation, closure or post-closure care. State programs that address industrial landfills and land application sites vary considerably. As noted above, only 35 percent of all industrial landfills currently have runoff/runoff controls. However, many are subject to closure requirements.

3. Pollutant Control Measures Required by Other EPA Programs

EPA recognizes that requirements under other Federal and State programs currently address reclamation/closure of and storm water management at landfill and land application sites. In developing requirements under this section, the Agency has considered how these other program requirements affect the characteristics of storm water discharges (e.g., by limiting contact with potential pollutant sources). Of specific note are recently imposed RCRA criteria at 40 CFR parts 257 and 258 that address the design, operation, and closure of MSWLFs. These regulations are summarized below.

Regulations at 40 CFR part 257 classify solid waste disposal facilities and practices. Regulations at 40 CFR part 258 establish criteria for municipal solid waste landfills. The types of criteria required include: location restrictions, operating criteria, design criteria, ground water monitoring and corrective action, closure and postclosure care, and financial

assurance criteria. All States must implement the Federal MSWLF criteria primarily through State solid waste management plans.

As part of the operating criteria, part 258 requires that all discrete units within MSWLFs receiving waste provide for the following by October 1993 (it should be noted that EPA has proposed an extension of this deadline to April 1994):

- (a) Owners or operators of all MSWLF units must design, construct, and maintain:
 - (1) A runoff control system to prevent flow onto the active portion of the landfill during the peak discharge from a 25-year storm;
 - (2) A runoff control system from the active portion of the landfill to collect and control at least the water volume resulting from a 24-hour, 25-year storm event.

In addition, all MSWLF units that received wastes after October 1991 are required to meet specific closure standards (see 40 CFR 258.60). These standards include installation of a final cover consisting of a minimum of 6 inches of topsoil over a minimum of 18 inches of clay. The cover must be no more permeable than the unit's liner.

The criteria also imply, but do not explicitly require, that revegetation should be performed.

These criteria indicate that for all but the most severe storm events (i.e., greater than the 24-hour, 25-year storm event), new units within MSWLFs will be required to separate storm water discharges from active and inactive areas. (Active areas are defined as those that have not yet received a final cover [as required under 258.60].) Further, the closure/final cover criteria described above are intended to prevent contact with waste materials and minimize erosion.

4. Options for Controlling Pollutants

a. Overview of section requirements.

This section establishes separate requirements for municipal solid waste landfills (MSWLFs) and industrial landfills. These requirements are discussed below.

(1) *MSWLFs.* The Agency believes that the MSWLF criteria in 40 CFR 258.60 will effectively separate runoff from active and inactive areas at newer landfills. As a result, separate requirements have been established for active and inactive areas at MSWLF sites.

For discharges from active landfill areas, the Agency believes that there is reasonable potential for runoff to contact waste materials. In these areas, runoff may also become commingled with leachate. In fact, a significant percentage of landfill facilities that submitted group applications, identified leachate and wastes as "exposed materials." The nature of exposed waste materials as well as the extensive data available for leachate characteristics suggest that the composition of runoff from MSWLFs will be highly site-specific. Existing data (see RCRA docket materials for the development and implementation of the 40 CFR part 258 criteria) show a wide range of inorganic and organic pollutants can be found in landfill leachate. In addition, total suspended solids (TSS) levels are also likely to be elevated where contact occurs with wastes, disturbed areas, and daily/intermediate cover materials.

At this time, the Agency does not believe that there are sufficient data available to establish numeric limits based on best available technology for storm water discharges from active MSWLF areas. The data submitted in the part 2 applications, as well as leachate data from available literature, suggest that a variety of constituents may be present at levels that are highly site-specific depending on the types and extent of contact with exposed wastes and extent of commingling with

leachate. Furthermore, the volumes of runoff generated will be dependent on the frequency and intensity of precipitation events. For TSS, little or no data are available to characterize the TSS levels in active landfill area runoff and to assess the performance of treatment technologies/best management practices currently in use.

Therefore, in this section, EPA is requiring that landfill operators develop storm water pollution prevention plans. For active landfill areas, these plans should be tailored toward minimizing contact of storm water with waste materials. The plans should also include design and implementation of best management practices and/or treatment methods to control the pollutants likely to be found in runoff at the site. For the active portion of the landfill, this section also requires quarterly monitoring for TSS and semiannual monitoring for other pollutants (see below) to determine pollutant loadings and quantify the performance of BMPs/treatment measures. These data may be used in the future in the development of individual and/or general permits to establish numeric limitations based on best available technology. It should also be noted that EPA is currently in the process of developing effluent limitation guidelines for discharges of leachate from waste management facilities (including MSWLFs). Where these effluent guidelines apply to discharges from active areas, facilities will be required to comply with these requirements on the effective date.

For units/areas that ceased receiving wastes after October 1991, EPA believes that closure criteria under 40 CFR 258.60 will minimize or eliminate pollutant loadings from waste materials to storm water. For MSWLF units closed in accordance with these criteria, TSS should be the only pollutant of concern. Again, EPA does not believe that adequate data are currently available to establish a numeric limitation based on best available technology (BAT) for TSS in storm water discharges from inactive areas. TSS concentrations in untreated storm water discharges have not been sufficiently well characterized to address the site-specific variability arising from local geology and topography along with individual cover materials and reclamation practices. Furthermore, the available data do not support an assessment of the relative performance of specific BMPs/treatment measures. Therefore, for inactive areas that were closed in accordance with 40 CFR 258.60 criteria, this section requires operators to include in their pollution prevention plans specific measures to control TSS in discharges. TSS

monitoring will be required to provide additional data on loadings and to evaluate the effectiveness of specific control measures.

The Agency is uncertain whether all MSWLF units which ceased receiving wastes prior to October 1991 will have been closed in such a manner to ensure long term stability and minimize the potential for runoff to contact wastes and leachate. Therefore, operators of units that were closed prior to October 1991 are required to conduct the same monitoring as required for active areas. This monitoring is intended to evaluate the integrity and performance of final cover materials in minimizing pollutant loadings to storm water discharges. Based on the results of this monitoring, the permitting authority may elect to continue/modify or terminate the required monitoring, provide for additional permit conditions (including specific BMPs and/or numeric limitations), or terminate coverage under the permit, as appropriate.

An exception from most monitoring requirements is provided for older landfill areas closed prior to October 1991 in accordance with State requirements that meet or exceed the final cover criteria in 40 CFR 258.60. Similar to newer units, TSS should be the only pollutant of concern at these sites and only quarterly TSS monitoring is required.

(2) *Industrial landfills.* As discussed above, minimal data are available to characterize storm water discharges or management practices for industrial solid waste landfills. EPA recognizes that onsite landfills are likely to be dedicated waste management units. However, the 1988 Report to Congress indicates that these onsite units can be found at sites in virtually every major industrial category. Offsite landfills can receive industrial wastes from almost any sources. Further, there are no current or planned Federal minimum requirements for runoff/runoff control and closure of these onsite and offsite facilities. As a result, existing State programs vary. Some States have extensive permitting and design standard requirements for industrial landfills, often for specific waste types. In contrast, other States have much more limited industrial solid waste programs.

Because of the variability between sites, the need for representative runoff characterization data, and the lack of information on BMP/treatment method performance, this section does not establish effluent limitations for storm water discharges from industrial landfills. At this time, best available technology shall consist of development

and implementation of pollution prevention plans. In addition, to ensure protection of water quality, the Agency has established monitoring requirements based on the concern that runoff from industrial landfills may contact waste materials and/or leachate. The monitoring requirements for active MSWLF areas are based on existing leachate characterization data which show the potential for virtually all priority pollutants to be present. Since this is also likely to be true for industrial landfills, similar monitoring requirements (including toxicity testing) are being required for industrial landfills.

(3) *Land application sites.* This section includes the same requirements for land application sites as for industrial landfills (as described above). The Agency does not currently have sufficient data to identify specific pollutants common to land application sites and develop numeric limitations. Therefore, the Agency believes that requiring implementation of pollution prevention plans along with a broad range of monitoring requirements is appropriate.

5. Storm Water Pollution Prevention Plans Requirements

The requirements for storm water pollution prevention plans under this section build upon the requirements included in EPA's storm water general permit published on September 9 and 25, 1992 (57 FR 41236 and 57 FR 44438). As such, the following discussion focuses on the plan requirements that are specific to landfills and land application sites. The rationale for the common requirements applicable to all types of facilities covered under today's proposed permit (including landfills) is provided in Part VI of this fact sheet.

a. Description of potential pollutant sources. The first step in preventing pollution of storm water from landfills is to identify potential sources of storm water contamination. Consequently, EPA is requiring that landfill and land application site operators include, in their pollution prevention plan, a narrative description of activities at their facilities. The Agency is also requiring landfill permittees to identify on a site map the locations of active and closed cells or trenches, any known leachate springs or other areas where leachate may commingle with runoff, the locations of any leachate collection and handling systems, and the locations of stockpiles of landfill cover material. The Agency is requiring land application site permittees to identify on their site maps the locations of active

and inactive land application areas and the types of wastes applied in those areas, any known leachate springs or other areas where leachate may commingle with runoff, the locations of any leachate collection and handling systems, and the locations of temporary waste storage areas. EPA believes these requirements will, in the event contamination is detected in storm water, facilitate the identification of any source of contamination.

EPA is also requiring owners or operators to summarize all available sampling data for storm water and leachate generated at the site because the Agency believes these data will help to determine whether storm water is commingling with any leachate produced at the site. Finally, operators must identify any current NPDES-permitted discharges at their sites.

b. Measures and controls. EPA is requiring good housekeeping practices for materials storage areas exposed to precipitation and for vehicle tracking of sediment and waste. EPA believes good housekeeping practices provide a simple and inexpensive means of controlling pollutants from entering storm water and therefore will not be overly burdensome to regulated facilities.

EPA believes that frequent and thorough inspections are necessary to ensure adequate functioning of: sediment and erosion controls, leachate collection systems, intermediate and final covers, and significant materials storage containers. Failure of any of the aforementioned items could cause contamination of storm water with sediment, leachate, or significant materials stored onsite. EPA believes it is necessary to conduct inspections both during storm events and during dry weather. Inspections during dry periods allow facilities to identify and address any problems prior to a storm event, thereby minimizing the chance for storm water contamination. Inspections during significant storm events ensure that measures are functioning as originally intended and provide an opportunity for facilities to observe what materials and/or activities are exposed to storm water. Pollution prevention plans must address the specific inspection requirements for active and inactive landfills and land application sites described in Part XLL.3.a.(3).(d) of today's proposed permit.

Failures of significant materials storage containers, leachate collection and treatment systems, cover materials, and sedimentation and erosion controls can result in storm water contamination. EPA believes it is necessary to maintain

these items in good working order to prevent storm water contamination. Consequently, EPA is requiring (in pollution prevention plans) that owners or operators ensure the maintenance of material storage areas to prevent leaking or rupture and all elements of leachate collection and treatment systems to prevent commingling of leachate with storm water. Pollution prevention plans must also describe measures to be taken to protect the integrity and effectiveness of any intermediate and final covers.

Analyzed part 2 data submitted by landfill group applicants demonstrate elevated TSS concentrations (mean TSS grab sample concentration of 3,360 mg/L) in storm water discharges. EPA believes controls are needed to reduce potential TSS contamination of storm water and to reduce suspended solids which have been carried by storm water before the discharge leaves the site. Therefore, EPA has chosen to require that pollution prevention plans address both stabilization and structural controls to reduce potential TSS loadings to surface waters.

Monitoring and Reporting Requirements

Analytical monitoring requirements. EPA believes that landfill/land application sites may reduce the level of pollutants in storm water runoff from their sites through the development and proper implementation of the storm water pollution prevention plan requirements discussed in today's proposed permit. In order to provide a tool for evaluating the effectiveness of the pollution prevention plan and to characterize the discharge for potential environmental impacts, the proposed permit requires landfill/land application sites (except those that are closed in accordance with 40 CFR 256.60) to collect and analyze samples of their storm water discharges for the pollutants listed in Table L-5. The pollutants listed in Table L-5 were found to be above benchmark levels for a significant portion of landfill/land application sites that submitted quantitative data in the group application process, or are believed to be present based upon the description of industrial activities and significant materials exposed. Because these pollutants have been reported at levels of concern from landfill/land application sites, EPA is requiring monitoring after the pollution prevention plan has been implemented to assess the effectiveness of the pollution prevention plan and to help ensure that a reduction of pollutants is realized.

At a minimum, storm water discharges from landfill/land

application sites must be monitored quarterly during the second year of permit coverage. At the end of the second year of permit coverage, a facility must calculate the average concentration for each parameter listed in Table L-5. If the permittee collects more than four samples in this period, then they must calculate an average concentration for each pollutant of concern for all samples analyzed.

TABLE L-5.—INDUSTRY MONITORING REQUIREMENTS

| Pollutants of concern | Cut-off concentration (mg/L) |
|---|------------------------------|
| Total Suspended Solids (TSS) ⁱ | 100 |
| Total Phosphorus ⁱⁱ | 0.33 |
| Total Recoverable Iron ⁱⁱ ... | 0.3 |
| Total Recoverable Lead ⁱⁱ . | 0.0337 |

ⁱ Applicable to all landfill and land application sites.

ⁱⁱ Applicable to all facilities except MSWLF areas closed in accordance with 40 CFR 258.60 requirements.

If the average concentration for a parameter is less than or equal to the value listed in Table L-5, then the

permittee is not required to conduct quantitative analysis for that parameter during the fourth year of the permit. If, however, the average concentration for a parameter is greater than the cut-off concentration listed in Table L-5, then the permittee is required to conduct quarterly monitoring for that parameter during the fourth year of permit coverage. Monitoring is not required during the first, third, and fifth year of the permit. The exclusion from monitoring in the fourth year of the permit is conditional on the facility maintaining industrial operations and BMPs that will ensure a quality of storm water discharges consistent with the average concentrations recorded during the second year of the permit.

TABLE L-6.—SCHEDULE OF MONITORING

| | |
|-----------------------------------|--|
| 2nd Year of Permit Coverage | <ul style="list-style-type: none"> • Conduct quarterly monitoring. • Calculate the average concentration for all parameters analyzed during this period. • If average concentration is greater than the value listed in Table L-5, then quarterly sampling is required during the fourth year of the permit. • If average concentration is less than or equal to the value listed in Table L-5, then no further sampling is required for that parameter. |
| 4th Year of Permit Coverage | <ul style="list-style-type: none"> • Conduct quarterly monitoring for any parameter where the average concentration in year 2 of the permit is greater than the value listed in Table L-5. • If industrial activities or the pollution prevention plan have been altered such that storm water discharges may be adversely affected, quarterly monitoring is required for all parameters of concern. |

In cases where the average concentration of a parameter exceeds the cut-off concentration, EPA expects permittees to place special emphasis on methods for reducing the presence of those parameters in storm water discharges. Quarterly monitoring in the fourth year of the permit will reassess the effectiveness of the adjusted pollution prevention plan.

The monitoring cut off concentrations listed in Table L-5 are not numerical effluent limitations. These values represent a level of pollutant discharge which facilities may achieve through the implementation of pollution prevention plans. At least half of the facilities which submitted Part 2 data, reported concentrations less than or equal to the values listed in Table L-5. Facilities that achieve average discharge concentrations which are less than or equal to the values in Table L-5 are not relieved from the pollution prevention plan requirements or any other requirements of the permit.

b. Alternative certification. Throughout today's permit, EPA has proposed monitoring requirements for facilities which the Agency believes have the potential for contributing significant levels of pollutants to storm water discharges. The alternative described below is necessary to ensure

that monitoring requirements are only imposed on those facilities that do, in fact, have storm water discharges containing pollutants at concentrations of concern. EPA has determined that if materials and activities are not exposed to storm water at the site, then the potential for pollutants to contaminate storm water discharges does not warrant monitoring.

Therefore, a discharger is not subject to the monitoring requirements of this Part provided the discharger makes a certification for a given outfall, on an annual basis, under penalty of law, signed in accordance with Part VII.G. (Signatory Requirements), that material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, industrial machinery or operations, significant materials from past industrial activity, or, in the case of airports, deicing activities, that are located in areas of the facility that are within the drainage area of the outfall are not presently exposed to storm water and will not be exposed to storm water for the certification period. Such certification must be retained in the storm water pollution prevention plan and submitted to EPA in accordance with Part VI.C. of this permit.

c. Reporting requirements. Permittees are required to submit all monitoring results obtained during the second and fourth year of permit coverage within 3 months of the conclusion of each year. Such permittees must submit monitoring results on four separately signed Discharge Monitoring Report Forms to the Director. For facilities conducting monitoring beyond the minimum quarterly requirements an additional Discharge Monitoring Report Form must be filed for each analysis.

d. Sample type. All discharge data shall be reported for grab samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable.

If storm water discharges associated with industrial activity commingle with process or nonprocess water, then

where practicable permittees must attempt to sample the storm water discharge before it mixes with the non-storm water discharge.

EPA requests comments upon a condition of today's proposed permit that would require permittees who are unable to sample storm water discharges before they commingle with non-storm water discharges to sample the combined discharge both during dry and wet weather and submit both sets of data to the permitting authority.

e. Representative discharge. When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may test the effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluent. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

f. Monthly visual examination of storm water quality. Monthly visual inspections of a storm water discharge from each outfall are required at landfills and land application sites. The inspection must be of a grab sample collected from each storm water outfall. The examination of storm water grab samples shall include any observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, or other obvious indicators of storm water pollution. The inspection must be conducted in a well lit area. No analytical tests are required to be performed on these samples.

The examination must be made at least once in each month of the permit during daylight unless there is insufficient rainfall or snow-melt to runoff. EPA expects that, whenever practicable, the same individual should carry out the collection and examination of discharges throughout the life of the permit to ensure the greatest degree of consistency possible. Grab samples shall be collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 60 minutes) of when the

runoff begins discharging. Reports of the visual observation include: the examination date and time, examination personnel, visual quality of the storm water discharge, and probable sources of any observed storm water contamination. The visual observation reports must be maintained onsite with the pollution prevention plan.

When a discharger is unable to collect samples over the course of the monitoring period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

EPA believes that this quick and simple assessment will allow the permittee to approximate the effectiveness of his/her plan on a regular basis at very little cost. Although the visual examination cannot assess the chemical properties of the storm water discharged from the site, the examination will provide meaningful results upon which the facility may act quickly. The frequency of this visual inspection will also allow for timely adjustments to be made to the plan. If BMPs are performing ineffectively, corrective action must be implemented. A set of tracking or follow-up procedures must be used to ensure that appropriate actions are taken in response to the inspections. The visual examination is intended to be performed by members of the pollution prevention team. This hands-on inspection will enhance the staff's understanding of the storm water problems on that site and effects on the management practices that are included in the plan.

g. Baseline general permit variance. On September 9, 1992, and September 25, 1992, EPA published the Final NPDES General Permits for Storm Water Discharges Associated With Industrial Activity. These notices set out requirements for semiannual monitoring for several parameters for discharges from landfills and land application sites. These notices specifically require that facilities with storm water discharges that are associated with landfills and land application sites are required to monitor their storm water discharges for ammonia, magnesium, magnesium (dissolved), TKN, COD, TDS, TOC, oils and grease, pH, arsenic, barium, cadmium, chromium, total

cyanide, lead (total), mercury, iron, selenium, and silver. Today's proposed permit contains slightly different monitoring requirements. EPA requests comment upon the difference between the monitoring requirements set out for landfills and land application sites facilities in the September 1992 General Permits and those required in today's proposed permit.

TSS monitoring is being required at all landfill and land application sites because available sampling data as well as the nature of these operations (significant land disturbance) indicate that TSS is likely to be present at elevated levels (greater than 500 mg/L) in storm water discharges. This monitoring requirement will provide a measure to determine the effectiveness of the pollution prevention plans, particularly BMPs, in controlling erosion and to further assess potential impacts on receiving water quality.

Monitoring is being required for other parameters (except at sites closed in compliance with 40 CFR 258.60) that could be present in storm water discharges from landfills and land application facilities at individual sites where leachate commingles with runoff and/or contacts waste materials. This monitoring will allow EPA to determine whether prohibited commingling of leachate is occurring. Further, as noted previously, exposed materials and potential storm water pollutants (other than TSS) are highly site-specific because they depend upon current and past waste and materials management practices. Therefore, the required monitoring will allow the permitting authority to define and control specific pollutant sources at individual landfills.

Many of the required monitoring parameters, other than TSS, are similar to the parameters addressed by the ground water monitoring requirements for municipal solid waste landfills established under subtitle D of RCRA (see October 9, 1991 (56 FR 50978)) and are the same as the monitoring required under the storm water general permit published on September 9 and 25, 1992 (57 FR 41236 and 57 FR 44438). Based on landfill leachate data reviewed by EPA, monitoring for these parameters should indicate whether leachate is commingling with storm water and/or contamination is resulting from direct contact with waste materials.^{110 111}

¹¹⁰ "Landfill Leachate: A Survey of Chemical and Toxicity Characteristics and Evaluations of Receiving Stream Biological Impacts," Draft. West Virginia Department of Natural Resources, 1987.

¹¹¹ "Leachate Baseline Report: Determination of Municipal Landfill Leachate Characteristics," NUS Corporation, prepared for EPA, Date unknown.

Other parameters, such as total phosphorus, total aluminum, and total iron, also must be monitored because the median values for the industry are greater than levels of concern. The levels of concern are established from the most stringent storm water effluent limitations, Gold Book values, or NURP medians. The median values for these parameters, as submitted in part 2 of the applications, are: 0.50 mg/L; 9.49 mg/L; 0.840 mg/L; and 25.0 mg/L, respectively.

7. Alternative Monitoring Requirements

EPA requests comment upon the following monitoring and reporting requirements in lieu of those listed in Part XI.L.6 of today's proposed permit.

a. Quarterly monitoring requirement. During the period beginning on the effective date and lasting through the expiration date of this permit, all permittees under this section must conduct quarterly monitoring for total suspended solids in all storm water discharges authorized by this section. Permittees must report in accordance with Part VI.B. of the permit (Reporting: Where to Submit) and paragraph XI.L.7.d. (Reporting: When to Submit). In addition, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event which generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

b. Semiannual monitoring requirements. During the period beginning on the effective date and lasting through the expiration date of this permit, permittees with landfill and land application units identified in paragraphs XI.L.7.b.(1) through XI.L.7.b.(4) must monitor all storm water discharges from those sites at least semiannually (twice per year) for the following parameters, except as provided in VI.E.7. (Sampling Waiver), VI.E.6. (Representative Discharge), and XI.L.7. (Toxicity Testing). The permittees sample for the following parameters:

- pH
- Magnesium (total recoverable and dissolved)
- Total Kjeldahl nitrogen
- Chemical oxygen demand
- Total dissolved solids
- Total organic carbon
- Oil and grease
- Total recoverable arsenic
- Total recoverable barium
- Total recoverable cadmium

- Total recoverable chromium
 - Total recoverable cyanide
 - Total recoverable lead
 - Total recoverable mercury
 - Total recoverable selenium
 - Total recoverable silver
 - Acute whole effluent toxicity
- Landfill facilities which receive sewage sludge must also monitor semiannually for fecal coliform.

In addition to the parameters listed above, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event which generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled;

(1) All active disposal areas at municipal solid waste landfills. Active areas are defined as those areas that have not yet received a final cover.

(2) All inactive MSWLF areas that ceased receiving wastes before October 1991, unless these areas were closed in accordance with the closure/final cover requirements at 40 CFR 258.60.

(3) All active and inactive areas at industrial solid waste landfills.

(4) All areas where wastes have been applied at active and inactive land application sites.

c. Sample type. For all required monitoring, data shall be reported for grab samples.

d. Reporting: when to submit. Permittees shall collect quarterly samples during the sampling periods running from January to March, April to June, July to September, and October to December. Permittees that are required to conduct sampling pursuant to Part XI.L.5.b., shall collect semiannual samples during the sampling periods running from January to June and July to December. Permittees shall annually submit monitoring results obtained during the reporting period running from January to December on Discharge Monitoring Report Form(s) postmarked no later than the 28th day of the following January. A separate Discharge Monitoring Report Form is required for each sampling period. The first report may include less than 12 months of information.

e. Toxicity Testing—(1) Test Procedures. (a) The permittee shall conduct acute 24-hour static toxicity tests on both an appropriate invertebrate and an appropriate fish (vertebrate) test species (EPA/600/4-90-027 Rev. 9/91, Section 6.1). Freshwater species must be used for discharges to freshwater bodies. Due to the nonsaline nature of

rainwater, freshwater should also be used for discharges to estuarine, marine, or other naturally saline waterbodies.

(b) All test organisms, procedures, and quality assurance criteria used shall be in accordance with "Methods for Measuring the Acute Toxicity of Effluents to Freshwater and Marine Organisms," EPA/600/4-90-027, or the most current edition. The control water used will be moderately hard water as described in EPA/600/4-90-027, Table 6, or the most current edition.

(c.) Tests shall be conducted annually (once per year) on a grab sample of the discharge. Test shall be conducted using 100 percent effluent (no dilution) and a control consisting of synthetic dilution water. Results of all tests conducted with any species shall be reported according to EPA/600/4-90-027 (or the most current edition), Section 12, Report Preparation, and the report submitted to EPA with the Discharge Monitoring Reports (DMRs). On the DMR, the permittee shall report "0" if there is no statistical difference between the control mortality and the effluent mortality for each dilution. If there is statistical difference (exhibits toxicity), the permittee shall report "1" on the DMR.

(2) If acute whole effluent toxicity (statistically significant difference between the 100 percent dilution and the control) is detected in the storm water discharges, the permittee shall review the storm water pollution prevention plan and make appropriate modifications to assist in identifying the sources of toxicity and to reduce the toxicity of their storm water discharges. A summary of the review and the resulting modifications shall be provided in the plan.

M. Storm Water Discharges Associated With Industrial Activity From Automobile Salvage Yards

On November 16, 1990 (55 FR 47990), EPA promulgated the regulatory definition of "storm water discharges associated with industrial activity." This definition included point source discharges of storm water from eleven categories of facilities, including " * * * battery reclaimers, salvage yards, and automobile recyclers, including but limited to those classified as Standard Industrial Classification 5015 * * *."

This section establishes special conditions for the storm water discharges associated with industrial activities at automobile salvage yards. Storm water discharges covered by this section are discharges where precipitation and storm water runoff come into contact with significant materials including, but are not limited

to parts storage and cleaning, storage of junked vehicles, waste products, by-products, stored materials, fuels, and areas used for dismantling operations. This includes storm water discharges from access roads, and rail lines used or traveled by carriers of raw materials, manufactured products, waste materials, or by-products created by the facility. Washwaters from vehicle, equipment, and parts cleaning areas are process wastewaters. Discharges of process wastewater or discharges subject to process wastewater effluent limitation guidelines are not eligible for coverage under this section.

When an industrial facility, described by the above eligibility provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

If monitoring and pollution prevention plan requirements of another industrial activity section of this permit apply to co-located industrial activities at an industrial facility, the eligibility provisions of that industrial activity

section shall not preclude the operator of the industrial facility from complying with the applicable monitoring and pollution prevention plan requirements of that section.

1. Industry Profile

This section has been developed for storm water discharges associated with activities related to dismantling of used motor vehicles for the purpose of selling parts. As stated above, category (vi) of the definition of storm water discharges associated with industrial activity includes facilities primarily engaged in the wholesale or retail distribution of used motor vehicle parts and classified as SIC code 5015. Dismantlers are a major source for replacement parts for motor vehicles in service.

The following description summarizes operations that might occur at a typical automobile dismantling facility. The primary activity involves the dismantling or wrecking of used motor vehicles. Some facilities, however, perform vehicle maintenance and may rebuild vehicles for resale.

Typically, automobile dismantling facilities receive vehicles that are either uneconomical to run or wrecks that are uneconomical to repair. The nature of operations generally depends on the size and location of the facility. In urban areas where land is more valuable, vehicles are typically dismantled upon arrival, parts are segregated, cleaned, and stored. Remaining hulks are generally sold to scrap dealers rather than stored onsite due to limited space. In more rural areas, discarded vehicles are typically stored on the lot and parts

removed as necessary. Remaining hulks are sold to scrap dealers less frequently.

Once a used vehicle is brought to the site, fluids may be drained and the tires, gas tank, radiator, engine and seats may be removed. The dismantler may separate and clean parts. Such cleaning may include steam cleaning of the engine and transmission as well as the use of solvents to remove oil and grease and other residues. Usable parts are then inventoried and stored for resale. The remaining car and/or truck bodies are stored onsite for future sale of the sheet metal and glass. Stripped vehicles and parts that have no resale value are typically crushed and sold to a steel scrapper. Some operations may, however, convert used vehicles and parts into steel scrap as a secondary operation. This is accomplished by incineration, shearing (bale shearer), shredding, or baling.

According to the 1987 census, 6,075 establishments reported SIC code 5015 as their primary SIC code, although some estimates indicate that there may be as many as 11,000 to 12,000 of these facilities.¹¹² Vehicle wreckers and dismantlers are generally small, privately owned businesses. Most facilities employ 10 or fewer employees and derive the majority of their profits from the sale of usable parts. Only a small percentage of this universe consists of large establishments with fleets of trucks, cranes, mobile balers and computers to maintain inventories of parts.¹¹³

Table M-1 below lists potential pollutant sources from activities that commonly take place at automobile salvage yards.

TABLE M-1.—COMMON POLLUTANT SOURCES

| Activity | Pollutant source | Pollutants |
|--|---|--|
| Vehicle Dismantling | Oil, anti-freeze, batteries, gasoline, diesel fuel, hydraulic fluids. | Oil and grease, ethylene glycol, heavy metals. |
| Used Parts Storage | Batteries, chrome bumpers, wheel balance weights, tires, rims, filters, radiators, catalytic converters, engine blocks, hub caps, doors, drivelines, galvanized metals, mufflers. | Sulfuric acid, galvanized metals, heavy metals, petroleum hydrocarbons, suspended solids. |
| Outdoor Vehicle and Equipment Storage. | Leaking engines, chipping/corroding bumpers, chipping paint, galvanized metal. | Oil and grease, arsenic, organics, heavy metals, TSS. |
| Vehicle and Equipment Maintenance. | Parts cleaning | Chlorinated solvents, oil and grease, heavy metals, acid/alkaline wastes. |
| | Waste disposal of greasy rags, oil filters, air filters, batteries, hydraulic fluids, transmission fluids, radiator fluids, degreasers. | Oil, heavy metals, chlorinated solvents, acid/alkaline wastes, ethylene glycol. |
| | Spills of oil, degreasers, hydraulic fluids, transmission fluid, and radiator fluids. | Oil, arsenic, heavy metals, organics, chlorinated solvents, ethylene glycol. |
| | Fluids replacement, including oil, hydraulic fluids, transmission fluid, and radiator fluids. | Oil, arsenic, heavy metals, organics, chlorinated solvents, ethylene glycol. |
| Vehicle, Equipment, and Parts Washing Areas. | Washing and steam cleaning waters | Oil and grease, detergents, heavy metals, chlorinated solvents, phosphorus, salts, suspended solids. |

¹¹² "The Automobile Scrap Processing Industry," Howard Ness, P.E., 1984.

¹¹³ Ibid.

TABLE M-1.—COMMON POLLUTANT SOURCES—Continued

| Activity | Pollutant source | Pollutants |
|---|--|---|
| Liquid Storage in Above Ground Storage Tanks. | External corrosion and structural failure | Fuel, oil and grease, heavy metals, materials being stored. |
| | Installation problems | Fuel, oil and grease, heavy metals, materials being stored. |
| | Spills and overfills due to operator error | Fuel, oil and grease, heavy metals, materials being stored. |
| Illicit Connection to Storm Sewer. | Process wastewater | Dependent on operations. |
| | Sanitary water | Bacteria, biochemical oxygen demand (BOD), suspended solids. |
| | Floor drain | Oil and grease, heavy metals, chlorinated solvents, fuel, ethylene glycol. |
| | Vehicle washwaters | Oil and grease, detergents, metals, chlorinated solvents, phosphorus, suspended solids. |
| | Radiator flushing wastewater | Ethylene glycol. |
| | Leaking underground storage tanks | Materials stored or previously stored. |

2. Pollutants in Storm Water Discharges Associated With Automobile Salvage Yards

Impacts caused by storm water discharges from automobile salvage yards will vary. Several factors influence to what extent operations at the site can affect water quality. Such factors include: geographic location; hydrogeology; the types of industrial activity occurring outside (e.g., dismantling, vehicle and parts storage, or steam cleaning); the size of the operation; and the type, duration, and intensity of precipitation events. Each of these, and other factors, will interact to influence the quantity and quality of storm water runoff. For example, outdoor storage of leaking engine blocks may be a significant source of pollutants at some facilities, while dismantling operations is the primary source at

others. In addition, sources of pollutants other than storm water, such as illicit connections,¹¹⁴ spills, and other improperly dumped materials, may increase the pollutant loading discharged into waters of the United States.

EPA has identified the storm water pollutants and sources resulting from various automobile salvage yard activities in Table M-1. Table M-1 identifies oil, heavy metals, acids, and ethylene glycol as some of the parameters of concern at automobile salvage yards.

Part 2 group application data that was statistically summarized indicated, large variations in the minimum and maximum values were found for each of the eight conventional pollutants monitored:

- Grab sample values for total suspended solids ranged from 0 mg/L to

2300 mg/L respectively, and flow-weighted composite sample values ranged from 7.0 mg/L to 8565 mg/L.

- Chemical oxygen demand (COD) grab samples at monitoring facilities ranged from 12 mg/L to 1660 mg/L
- Oil and grease samples at sampling facilities ranged from 0 mg/L to 50 mg/L.

The remaining conventional pollutants sampled also varied in their minimum and maximum values. Table M-2 indicates the sampling results for all data statistically summarized by EPA. This table indicates the minimum and maximum values, means, medians, 95th percentiles, 99th percentiles, and the total number of data submittals for each of the conventional pollutants. Part 2 data which has not undergone statistical analysis is generally consistent with the values reported in Table M-2.

TABLE M-2.—STATISTICS FOR CONVENTIONAL POLLUTANTS IN STORM WATER¹

[In mg/L unless otherwise indicated]

| Pollutant | No. of sam- ples | | Mean | | Minimum | | Maximum | | Median | | 95th percentile | | 99th percentile | |
|-------------------------------------|---------------------|--------------------|--------|-------|---------|-------|---------|--------|--------|-------|-----------------|--------|-----------------|--------|
| Sample type | Grab | Comp ¹¹ | Grab | Comp | Grab | Comp | Grab | Comp | Grab | Comp | Grab | Comp | Grab | Comp |
| BOD ₅ | 13 | 28 | 7.15 | 12.61 | 2.00 | 1.00 | 16.00 | 62.00 | 6.00 | 6.50 | 16.00 | 48.00 | 16.00 | 62.00 |
| COD | 30 | 13 | 135.00 | 66.23 | 12.00 | 34.00 | 1660.00 | 155.00 | 61.00 | 60.00 | 250.00 | 155.00 | 1660.00 | 155.00 |
| Nitrate + Nitrite Nitrogen | 13 | 30 | 1.70 | 1.62 | 0.17 | 0.09 | 5.65 | 5.23 | 0.83 | 1.32 | 5.65 | 4.87 | 5.65 | 5.23 |

¹¹⁴ Illicit connections are contributions of unpermitted non-storm water discharges to storm sewers from any number of sources including

improper connections, dumping or spills from industrial facilities, commercial establishments, or residential dwellings. The probability of illicit

connections at used motor vehicle parts facilities is low yet it may be applicable at some operations.

TABLE M-2.—STATISTICS FOR CONVENTIONAL POLLUTANTS IN STORM WATER—Continued

[In mg/L unless otherwise indicated]

| Pollutant | No. of samples | | Mean | | Minimum | | Maximum | | Median | | 95th percentile | | 99th percentile | |

ⁱ Applications that did not report the units of measurement for the reported values of pollutants were not included in these statistics.ⁱⁱ Composite samples.

TABLE M-3.—STORM WATER BMPs FOR AUTOMOBILE SALVAGE YARDS

| Activity | BMPs |
|---|---|
| Dismantling and vehicle maintenance | <p>Drain all fluids from vehicles upon arrival at the site. Segregate the fluids and properly store or dispose of them.</p> <p>Maintain an organized inventory of materials used in the maintenance shop.</p> <p>Keep waste streams separate (e.g., waste oil and mineral spirits). Nonhazardous substances that are contaminated with a hazardous substance is considered a hazardous substance.</p> <p>Recycle anti-freeze, gasoline, used oil, mineral spirits, and solvents.</p> <p>Dispose of greasy rags, oil filters, air filters, batteries, spent coolant, and degreasers properly.</p> <p>Label and track the recycling of waste material (e.g., used oil, spent solvents, batteries).</p> <p>Drain oil filters before disposal or recycling.</p> <p>Store cracked batteries in a nonleaking secondary container.</p> <p>Promptly transfer used fluids to the proper container. Do not leave full drip pans or other open containers around the shop. Empty and clean drip pans and containers.</p> <p>Do not pour liquid waste down floor drains, sinks, or outdoor storm drain inlets.</p> <p>Plug floor drains that are connected to the storm or sanitary sewer. If necessary, install a sump that is pumped regularly.</p> |
| Dismantling and vehicle maintenance | <p>Inspect the maintenance area regularly for proper implementation of control measures.</p> <p>Filtering storm water discharges with devices such as oil water separators.</p> <p>Train employees on proper waste control and disposal procedures.</p> |
| Outdoor vehicle, equipment, and parts storage | <p>Use drip pans under all vehicles and equipment waiting for maintenance and during maintenance.</p> <p>Store batteries on impervious surfaces. Curb, dike or berm this area.</p> <p>Confine storage of parts, equipment and vehicles to designated areas.</p> <p>Cover all storage areas with a permanent cover (e.g., roofs) or temporary cover (e.g., canvas tarps).</p> <p>Install curbing, berms or dikes around storage areas.</p> <p>Inspect the storage yard for filling drip pans and other problems regularly.</p> <p>Train employees on procedures for storage and inspection items.</p> |
| Vehicle, equipment and parts washing areas | <p>Avoid washing parts or equipment outside.</p> <p>Use phosphate-free biodegradable detergents.</p> <p>Consider using detergent-based or water-based cleaning systems in place of organic solvent degreasers.</p> <p>Designate an area for cleaning activities.</p> <p>Contain steam cleaning washwaters or discharge under an applicable NPDES permit.</p> <p>Ensure that washwaters drain well.</p> <p>Inspect cleaning area regularly.</p> <p>Install curbing, berms or dikes around cleaning areas.</p> <p>Train employees on proper washing procedures.</p> |
| Liquid storage in above ground containers | <p>Maintain good integrity of all storage containers.</p> <p>Install safeguards (such as diking or berming) against accidental releases at the storage area.</p> |
| Liquid storage in above ground containers | <p>Inspect storage tanks to detect potential leaks and perform preventive maintenance.</p> <p>Inspect piping systems (pipes, pumps, flanges, couplings, hoses, and valves) for failures or leaks.</p> |
| Improper connection with storm sewers | <p>Train employees on proper filling and transfer procedures.</p> <p>Plug all floor drains if it is unknown whether the connection is to storm sewer or sanitary sewer systems. Alternatively, install a sump that is pumped regularly.</p> <p>Perform dye testing to determine if interconnections exist between sanitary water system and storm sewer system.</p> <p>Update facility schematics to accurately reflect all plumbing connections.</p> <p>Install a safeguard against vehicle washwaters and parts cleaning waters entering the storm sewer unless permitted.</p> <p>Maintain and inspect the integrity of all underground storage tanks; replace when necessary.</p> <p>Train employees on proper disposal practices for all materials.</p> |

- Minnesota Technical Assistance Program. September 1988. "Waste minimization—Auto Salvage Yards."

A number of facilities reported nondetects or values below detection limits: Nine facilities reported nondetects for oil and grease grab samples; one sampling facility reported a value below the detection limit for total suspended solids in a grab sample; and seven facilities reported nondetects for total phosphorus composite samples.

The condition of vehicles and the activities that occur at automobile salvage yards frequently result in significant losses of fluids which release toxic metals, oil and grease and polychlorinated aromatic hydrocarbons to storm water runoff. In addition, the weathering of plated and nonplated metal surfaces (e.g., bumpers) may contribute toxic metals to storm water runoff. The selection of pollutant parameters for continued monitoring are based upon the nature of automobile salvage yard activities, exposed materials at these sites, and a review of the data submitted for part 2 of the group application process. The following is a discussion of pollutants associated with the industrial activity of automobile salvage yards:

- **Total Suspended Solids (TSS)**—Permittees are required to sample for TSS because salvage yards are typically sparsely vegetated or have a low percentage of impervious land areas and, therefore, are unstabilized. Total suspended solids in storm water discharges from automobile salvage yards will primarily consist of inorganic materials such as sand, silt, and clay. Because suspended solids increase the turbidity of water, less light is able to penetrate the water, reducing photosynthetic activity of aquatic vegetation. Over time, total suspended solids settle out to form deposits that can be detrimental to stream environments. These deposits may destroy fauna that breed and grow in or near the bottoms of streams and serve as food for fish and other aquatic life. The deposits can also blanket and destroy spawning grounds for fish. The part 2 data statistically summarized showed a wide range of minimum and maximum TSS values (0.0 mg/L to 2,300 mg/L for grab samples and 7 mg/L to 8,565 mg/L for flow-weighted composite samples).

- **Oil and Grease**—There are several sources of oil and grease at automobile salvage yards. Typically these sources

include: Dismantling activities; vehicle and equipment maintenance; outdoor storage of vehicles, equipment and parts; and cleaning operations. Oil and grease emulsions are also detrimental to aquatic organisms and inhabitants because: (1) Deposition of oil and grease in bottom sediments can serve to inhibit normal benthic growths, impacting the aquatic food chain; (2) oil and grease emulsion may destroy algae or other plankton; (3) oil and grease emulsions may adhere to the gills of fish exerting a toxic effect to fish; and (4) water insoluble components damage the plumage and coats of aquatic animals and fowl. Floating oil may reduce the re-aeration of the water surface, and in conjunction with emulsified oil, may interfere with photosynthesis. In addition to environmental impacts, oil and grease impact the aesthetic qualities of water by forming unsightly surface slicks that affect water beaches and shorelines. Statistically summarized part 2 data indicated a wide range of minimum and maximum oil and grease values from 0.0 mg/L to 50 mg/L. Additional part 2 data revealed a higher maximum value for oil and grease.

- **pH**—The pH level is easily measured and is an indication of potential environmental impacts. Storm water discharges with pH values markedly different from the pH values of the receiving stream are potentially detrimental to the environment. At outfalls and prior to complete mixing of storm water discharges with receiving waters, a zone of sudden pH change can damage or kill biota engulfed in the zone of change. Statistically summarized part 2 data indicated that pH varies from a minimum of 6.4 to a high of 8.3.

- **Chemical Oxygen Demand (COD)**—COD measures the total amount of oxygen necessary for oxidation. The statistically summarized part 2 indicated a wide range in the 30 grab sample values from 12 mg/L to 1,660 mg/L, while the 13 composite samples varied from 34 mg/L to 155 mg/L. The higher COD levels may be attributed to the presence of biologically resistant organics, such as oil and grease. Further supporting EPA's belief that COD is a pollutant of concern at automobile salvage yards, a review of additional part 2 data revealed grab and composite

sample values above the mean and median concentrations listed in Table M-2.

3. Options for Controlling Pollutants

In evaluating options for controlling pollutants in storm water discharges, EPA must achieve compliance with the technology-based standards of the Clean Water Act [Best Available Technology (BAT) and Best Conventional Technology (BCT)]. The Agency does not believe that it is appropriate to establish specific numeric effluent limitations or a specific design or performance standard in this section for storm water discharges associated with industrial activity from automobile salvage yard operations to meet the BAT/BCT standards of the Clean Water Act. Because of the diversity of operations at automobile salvage yards and the lack of sufficient storm water quality data currently available to EPA, establishing numeric effluent limitations is not feasible at this time. Rather, this section establishes requirements for the development and implementation of a site-specific storm water pollution prevention plan consisting of a set of Best Management Practices that are sufficiently flexible to address different sources of pollutants at different sites.

Best Management Practices (BMPs) are implemented to prevent and/or eliminate pollutants in storm water discharges. EPA believes the most effective BMPs for reducing pollutants in storm water discharges from automobile salvage yards is through exposure minimization practices. Exposure minimization practices minimize the potential for storm water to come in contact with pollutants. These BMP methods are generally uncomplicated and inexpensive practices. They are easy to implement, and require little or no maintenance. In some instances, more resources intensive BMPs, including detention ponds or filtering devices, may be necessary depending on the type of discharge, types and concentrations of contaminants, and volume of flow.

The selection of the most effective BMPs will be based on site-specific considerations such as: Facility size, climate, geographic location, geology/hydrology and the environmental

setting of each facility, and volume and type of discharge generated. Each facility will be unique in that the source, type, and volume of contaminated storm water discharges will differ. In addition, the fate and transport of pollutants in these discharges will vary. EPA believes that the management practices discussed herein are well suited mechanisms to prevent or control the contamination of storm water discharges associated with automobile salvage yards.

Part 1 group application data indicate that BMPs have not been widely implemented at the representative sampling facilities. Less than 5 percent of the sampling subgroup list indoor storage as a material management practice. Less than 8 percent of the representative sampling facilities use covering at their storage areas. Less than 3 percent of the representative facilities utilize waste minimization practices. The most commonly listed (approximately 20 percent) material management practice is draining fluids from vehicles prior to storage. Because BMPs described in part 1 data are limited, Table M-3 is provided to identify BMPs associated with activities that may be employed at automobile salvage yards.

4. Pollutant Control Measures Required Through Other EPA Programs

Because hazardous substances including oil, gasoline, and lead are commonly found at automobile salvage yards, such facilities may be subject to other State or Federal environmental protection programs. In particular, as described below, the Resource Conservation and Recovery Act (RCRA) and the Underground Storage Tank (UST) programs require careful management of materials used onsite which decreases the probability that storm water from such areas will be contaminated by these materials.

Under the RCRA program, on September 10, 1992, EPA promulgated standards in 40 CFR part 279 for the management of used oils that are recycled (57 FR 41566). These standards include requirements for used oil generators, transporters, processors/refiners, and burners. The standards for used oil generators apply to all generators, regardless of the amount of used oil they generate. Do-it-yourself (DIY) generators which generate used oil from the maintenance of their personal vehicles, however, are not subject to the management standards in 40 CFR 279.20(a)(1).

The requirements for used oil generators were designed to impose a minimal burden on generators while

protecting human health and the environment from the risks associated with managing used oil. Under subpart C of 40 CFR part 279, used oil generators must not store used oil in units other than tanks, containers, or units subject to regulation under 40 CFR parts 264/265 (Section 279.22(a)). In other words, generators may store used oil in tanks or containers that are not subject to Subpart J (hazardous waste tanks) or Subpart I (containers) of 40 CFR parts 264/265, as long as such tanks or containers are maintained in compliance with the used oil management standards. This does not preclude generators from storing used oil in Subpart J tanks or Subpart I containers or other units, such as surface impoundments (Subpart K), that are subject to regulation under 40 CFR part 264 or 265.

Storage units at generator facilities must be maintained in good condition and labeled with the words "used oil." Upon detection of a release of used oil to the environment, a generator must take steps to stop the release, contain the released used oil, and properly manage the released used oil and other materials [40 CFR 279.22 (b) to (d)]. Generators storing used oil in underground storage tanks are subject to the UST regulations in 40 CFR part 280.

If used oil generators ship used oil offsite for recycling, they must use a transporter who has notified EPA and obtained an EPA identification number [40 CFR 279.24].

The technical standards for USTs at 40 CFR part 280 require that new UST systems (defined as systems for which installation commenced after December 12, 1988) use overfill prevention equipment that will: (1) Automatically shut off flow into the tank when the tank is no more than 95 percent full; or (2) alert the transfer operator when the tank is no more than 90 percent full by restricting the flow into the tank or triggering a high level alarm. The preceding requirements do not apply to systems that are filled by transfers of no more than 25 gallons at one time. Existing UST systems (defined as systems for which installation has commenced on or before December 12, 1988) are required to have installed the described overfill prevention equipment by December 12, 1998.

5. Storm Water Pollution Prevention Plan Requirements

EPA believes that pollution prevention is the most effective approach for controlling contaminated storm water discharges from automobile salvage yards. Pollution prevention plans allow the operator of a facility to

select BMPs based on site-specific considerations such as: facility size; climate; geographic location; geology/hydrology; the environmental setting of each facility; and volume and type of discharge generated. This flexibility is necessary because each facility will be unique in that the source, type, and volume of contaminated surface water discharges will differ from site to site.

Under today's proposed general permit, all facilities must prepare and implement a storm water pollution prevention plan. The establishment of a pollution prevention plan requirement reflects EPA's decision to allow operators of automobile salvage yards to utilize BMPs as the BAT/BCT level of control for the storm water discharges covered by this section. The requirements included in pollution prevention plans provide a flexible framework for the development and implementation of site specific controls to minimize pollutants in storm water discharges. This approach and associated deadlines are consistent with EPA's storm water general permits finalized on September 9, 1992 and September 25, 1992 for discharges in nonauthorized NPDES States (57 FR 41236).

There are two major objectives to a pollution prevention plan: (1) To identify sources of pollution potentially affecting the quality of storm water discharges associated with industrial activity from a facility; and (2) to describe and ensure implementation of practices to minimize and control pollutants in storm water discharges associated with industrial activity from a facility.

Specific requirements for a pollution prevention plan for automobile salvage yards are described below. These requirements must be implemented in addition to the baseline pollution prevention plan provisions discussed previously.

a. Contents of the plan. Storm water pollution prevention plans are intended to aid operators of automobile salvage yards to evaluate all potential pollution sources at a site, and assist in the selection and implementation of appropriate measures designed to prevent, or control, the discharge of pollutants in storm water runoff. EPA has developed guidance entitled "Storm Water Management for Industrial Activities: Developing Pollution Prevention Plans and Best Management Practices," EPA, 1992, (EPA 832-R-92-006) to assist permittees in developing and implementing pollution prevention measures.

(1) *Description of potential pollution sources.* There are no requirements

beyond those described in Part VI.C.2 of this fact sheet.

(2) *Measures and controls.* Following completion of the source identification and assessment phase, the permittee must evaluate, select, and describe the pollution prevention measures, best management practices (BMPs), and other controls that will be implemented at the facility. For the following areas at the site, the permittee must assess the applicability of the corresponding BMPs:

- *Vehicle Dismantling and Maintenance Areas*—The plan must describe measures that prevent or minimize contamination of the storm water runoff from all areas used for vehicle dismantling and maintenance. The facility must consider draining and segregating all fluids from vehicles upon arrival at the site, or as soon as feasible thereafter. The facility must consider performing all maintenance activities indoors, maintaining an organized inventory of materials used in the shop, draining all parts fluids prior to disposal, prohibiting the practice of hosing down the shop floor, using dry cleanup methods, and/or collecting the storm water runoff from the maintenance area and providing treatment. Where dismantling and maintenance activities can not take place indoors, facilities may consider methods for containing oil or other fluid spillage during parts removal. Drip pans, large plastic sheets, or canvas may be considered for placement under vehicles or equipment during maintenance and dismantling activities. Where drip pans are used, they should not be left unattended to prevent accidental spills.

- *Vehicle, Parts, and Equipment Storage Areas*—The storage of vehicles, parts, and equipment must be confined to designated areas (delineated on the site map). The plan must describe measures that prevent or minimize contamination of the storm water runoff from these areas. The facility must consider the use of drip pans, large sheets of plastic, canvas (or equivalent measures) under vehicles, parts, and equipment. Canvas or sheets of plastic may be used as temporary coverage of storage areas. Indoor storage of vehicles, parts and equipment, as well as the installation of roofs, curbing, berming and diking of these areas must be considered. Large plastic or metal bins with secure lids should be used to store oily parts (e.g., small engine parts). Used batteries should be stored within nonleaking secondary containment or by other equivalent means to prevent leaks of acid into storm water discharges.

- *Material Storage Areas*—As part of a good housekeeping program, consider labelling storage units of all materials (e.g., used oil, used oil filters, spent solvents, paint wastes, radiator fluids, transmission fluids, hydraulic fluids). Maintain such containers and units in good condition, so as to prevent contamination of storm water. The plan must describe measures that prevent or minimize contamination of the storm water runoff from such storage areas. The facility may consider indoor storage of the materials and/or installation of berming and diking of the area.

- *Vehicle, Equipment, and Parts Cleaning Areas*—The plan must describe measures that prevent or minimize contamination of storm water from all areas used for vehicle, equipment, and parts cleaning. The facility must consider performing all cleaning operations indoors. In addition, the facility must consider covering or berming the cleaning operation area. Washwaters from vehicle, equipment, and parts cleaning areas are process wastewaters that are not authorized discharges under this section.

These four areas are sources of pollutants in storm water from automobile salvage yards. EPA believes that the incorporation of BMPs such as those suggested, in conjunction with a pollution prevention plan, will substantially reduce the potential of storm water contamination from these areas. In addition, EPA believes that these requirements continue to provide the necessary flexibility to address the variable risk for pollutants in storm water discharges associated with different facilities.

(a) *Preventive Maintenance*—Permittees are required to develop a preventive maintenance program that includes regular inspections and maintenance of storm water BMPs. The purpose of the inspections is check on the effectiveness of the storm water pollution prevention plan. The inspections allow facility personnel to monitor the success or failure of elements of the plan on a regular basis. The use of an inspection checklist should be considered. The checklist will ensure that all required areas are inspected, as well as help to meet the recordkeeping requirements.

(b) *Inspections*—This section proposes that in addition to the comprehensive site evaluation required under Part XI.M.3.a. of today's proposed permit, qualified facility personnel shall be identified to inspect: Upon arrival, or as soon as feasible thereafter, all vehicles for leaks; any equipment containing oily parts, hydraulic fluids,

or any other fluids, at least quarterly for leaks; and any outdoor storage containers for liquids, including, but not limited to, brake fluid, transmission fluid, radiator water, and anti-freeze, at least quarterly for leaks.

In addition, qualified facility personnel are required to conduct, at a minimum, quarterly visual inspections of BMPs. The inspections shall include: (1) An assessment of the integrity of any flow diversion or source minimization systems; and (2) visual inspections of dismantling areas; outdoor vehicle, equipment, and parts storage area; vehicle and equipment maintenance areas; vehicle, equipment, and parts washing areas; and liquid storage in above ground containers. A set of tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections.

The quarterly visual inspections must be made at least once in each of the following designated periods during daylight hours: December to February (storm water runoff or snow melt); March to May (storm water runoff); June to August (storm water runoff); September to November (storm water runoff). Records of inspections shall be maintained as part of the plan.

(c) *Employee training*—Permittees are required to identify annual dates for such training. Employee training must, at a minimum, address the following areas when applicable to a facility: used oil management; spill prevention and response; good housekeeping practices; used battery management; and proper handling (i.e., collection, storage, and disposal) of all fluids. Unlike some industrial operations, the industrial activities associated with automobile salvage yards that may affect storm water quality require the cooperation of all employees, not just one or two people. EPA, therefore, is proposing to require that employee training take place at least annually to serve as: (1) Training for new employees; (2) a refresher course for existing employees; and (3) training for all employees on any storm water pollution prevention techniques recently incorporated into the plan.

(d) *Recordkeeping and internal reporting*—Permittees must describe procedures for developing and retaining records on the status and effectiveness of plan implementation. The plan must address spills, monitoring, and BMP inspection and maintenance activities. Ineffective BMPs must be reported and the date of their corrective action noted. Employees must report incidents of leaking fluids to facility management

and these reports must be incorporated into the plan.

In addition, the facility must maintain records (gallons per month) of drained waste oil, anti-freeze, and gasoline; identify by name and EPA or State identification number (if any) all transporters, recyclers, and disposal facilities of used waste oil, antifreeze, batteries, scrap and tires; maintain records (gallons per month) of waste oil, anti-freeze, gasoline, freon, batteries, scrap materials, and tires that are sent to recyclers; and maintain records of the number of batteries removed from cars and sold or recycled per month. These materials are all significant sources of pollutants in storm water discharges. By maintaining such records, which for the most part should be readily accessible, the pollution prevention team will be able to more accurately track the potential for these materials to contribute to storm water pollution.

(e) *Storm water management*—The permittee must evaluate the appropriateness of each storm water BMP that diverts, infiltrates, reuses, or otherwise reduces the discharge of contaminated storm water. In addition, the permittee must describe the storm water pollutant source area or activity (i.e., loading and unloading operations, raw material storage piles etc.) to be controlled by each storm water management practice.

(3) *Comprehensive site compliance evaluation*. The storm water pollution prevention plan must describe the scope and content of comprehensive site inspections that qualified personnel will conduct to: (1) Confirm the accuracy of the description of potential pollution sources contained in the plan; (2) determine the effectiveness of the plan; and (3) assess compliance with the terms and conditions of this section. Comprehensive site compliance evaluations should be conducted twice a year for automobile salvage yards. These inspections are intended to be more in depth than the quarterly visual

inspections. The individual or individuals who will conduct the inspections must be identified in the plan and should be members of the pollution prevention team. Inspection reports must be retained for at least 3 years after the date that the permit expires.

Based on the results of each inspection, the description of potential pollution sources, and measures and controls, the plan must be revised as appropriate within 2 weeks after each inspection. Changes in the measures and controls must be implemented on the site in a timely manner, and never more than 12 weeks after completion of the inspection.

6. Monitoring and Reporting Requirements

a. *Analytical monitoring requirements*. EPA believes that automobile salvage yards may reduce the level of pollutants in storm water runoff from their sites through the development and proper implementation of the storm water pollution prevention plan requirements discussed in today's proposed permit. In order to provide a tool for evaluating the effectiveness of the pollution prevention plan and to characterize the discharge for potential environmental impacts, the proposed permit requires automobile yards to collect and analyze samples of their storm water discharges for the pollutants listed in Table M-4. The pollutants listed in Table M-4 were found to be above benchmark levels for a significant portion of sampling facilities that submitted quantitative data in the group application process, or are believed to be present based upon the description of industrial activities and significant materials exposed. Because these pollutants have been reported at benchmark levels from automobile salvage yards, EPA is requiring monitoring after the pollution prevention plan has been implemented to assess the effectiveness of the

pollution prevention plan and to help ensure that a reduction of pollutants is realized.

At a minimum, storm water discharges from automobile salvage yards must be monitored quarterly during the second year of permit coverage. At the end of the second year of permit coverage, a facility must calculate the average concentration for each parameter listed in Table M-4. If the permittee collects more than four samples in this period, then they must calculate an average concentration for each pollutant of concern for all samples analyzed.

TABLE M-4.—INDUSTRY MONITORING REQUIREMENTS

| Pollutants of concern | Cut-off concentration |
|-----------------------------------|-----------------------|
| Chemical Oxygen Demand (COD). | 65 mg/L. |
| pH | 6 to 9 s.u. |
| Total Suspended Solids | 100 mg/L. |
| Total Kjeldahl Nitrogen | 1.5 mg/L. |
| Nitrate plus Nitrite as Nitrogen. | 0.68 mg/L. |

If the average concentration for a parameter is less than or equal to the value listed in Table M-4, then the permittee is not required to conduct quantitative analysis for that parameter during the fourth year of the permit. If, however, the average concentration for a parameter is greater than the cut-off concentration listed in Table M-4, then the permittee is required to conduct quarterly monitoring for that parameter during the fourth year of permit coverage. Monitoring is not required during the first, third, and fifth year of the permit. The exclusion from monitoring in the fourth year of the permit is conditional on the facility maintaining industrial operations and BMPs that will ensure a quality of storm water discharges consistent with the average concentrations recorded during the second year of the permit.

TABLE M-5.—SCHEDULE OF MONITORING

| | |
|-----------------------------------|--|
| 2nd Year of Permit Coverage | <ul style="list-style-type: none"> • Conduct quarterly monitoring. • Calculate the average concentration for all parameters analyzed during this period. • If average concentration is greater than the value listed in Table M-4, then quarterly sampling is required during the fourth year of the permit. • If average concentration is less than or equal to the value listed in Table M-4, then no further sampling is required for that parameter. |
| 4th Year of Permit Coverage | <ul style="list-style-type: none"> • Conduct quarterly monitoring for any parameter where the average concentration in year 2 of the permit is greater than the value listed in Table M-4. • If industrial activities or the pollution prevention plan have been altered such that storm water discharges may be adversely affected, quarterly monitoring is required for all parameters of concern. |

In cases where the average concentration of a parameter exceeds the cut-off concentration, EPA expects permittees to place special emphasis on methods for reducing the presence of those parameters in storm water discharges. Quarterly monitoring in the fourth year of the permit will reassess the effectiveness of the adjusted pollution prevention plan.

b. Alternative certification.

Throughout today's permit, EPA has proposed monitoring requirements for facilities which the Agency believes have the potential for contributing significant levels of pollutants to storm water discharges. The alternative described below is necessary to ensure that monitoring requirements are only imposed on those facilities that do, in fact, have storm water discharges containing pollutants at concentrations of concern. EPA has determined that if materials and activities are not exposed to storm water at the site, then the potential for pollutants to contaminate storm water discharges does not warrant monitoring.

Therefore, a discharger is not subject to the monitoring requirements of this Part provided the discharger makes a certification for a given outfall, on an annual basis, under penalty of law, signed in accordance with Part VII.G (Signatory Requirements), that material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, industrial machinery or operations, significant materials from past industrial activity, or, in the case of airports, deicing activities, that are located in areas of the facility that are within the drainage area of the outfall are not presently exposed to storm water and will not be exposed to storm water for the certification period. Such certification must be retained in the storm water pollution prevention plan and submitted to EPA in accordance with Part VI.C of this permit.

c. Reporting requirements. Permittees are required to submit all monitoring results obtained during the second and fourth year of permit coverage within 3 months of the conclusion of each year. Such permittees must submit monitoring results on four separately signed Discharge Monitoring Report Forms to the Director. For facilities conducting monitoring beyond the minimum quarterly requirements an additional Discharge Monitoring Report Form must be filed for each analysis.

d. Sample type. All discharge data shall be reported for grab samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in

magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable. If storm water discharges associated with industrial activity commingle with process or nonprocess water, then where practicable permittees must attempt to sample the storm water discharge before it mixes with the non-storm water discharge.

EPA requests comments upon a condition of today's proposed permit that would require permittees who are unable to sample storm water discharges before they commingle with non-storm water discharges to sample the combined discharge both during dry and wet weather and submit both sets of data to the permitting authority.

e. Representative discharge. When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may test the effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluent. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

f. Monthly visual examination of storm water quality. Monthly visual inspections of storm water discharges from each outfall are required at automobile salvage yards. The examination of storm water grab samples shall include any observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, or other obvious indicators of storm water pollution. The inspection must be conducted in a well lit area. No analytical tests are required to be

performed on these samples. The inspections must be of a grab sample collected from each storm water outfall.

The examination must be made at least once in each month of the permit during daylight unless there is insufficient rainfall or snow-melt to runoff. EPA expects that, whenever practicable, the same individual should carry out the collection and examination of discharges throughout the life of the permit to ensure the greatest degree of consistency possible. Grab samples shall be collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 60 minutes) of when the runoff begins discharging. Reports of the visual observation include: the examination date and time, examination personnel, visual quality of the storm water discharge, and probable sources of any observed storm water contamination. The visual observation reports must be maintained onsite with the pollution prevention plan.

When a discharger is unable to collect samples over the course of the monitoring period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

EPA believes that this quick and simple assessment will allow the permittee to approximate the effectiveness of his/her plan on a regular basis at very little cost. Although the visual examination cannot assess the chemical properties of the storm water discharged from the site, the examination will provide meaningful results upon which the facility may act quickly. The frequency of this visual inspection will also allow for timely adjustments to be made to the plan. If BMPs are performing ineffectively, corrective action must be implemented. A set of tracking or follow-up procedures must be used to ensure that appropriate actions are taken in response to the inspections. The visual examination is intended to be performed by members of the pollution prevention team. This hands-on inspection will enhance the staff's understanding of the storm water problems on that site and the effects of the management practices that are included in the plan.

g. Baseline general permit variance. On September 9, 1992, and September

25, 1992, EPA published the Final NPDES General Permits for Storm Water Discharges Associated With Industrial Activity. These notices set out requirements for semiannual monitoring of several parameters for discharges from automobile salvage yard facilities. These notices specifically require that facilities with storm water discharges that are associated with automobile salvage yards are required to monitor their storm water discharges for oil and grease, COD, TSS, and pH. Today's proposed permit contains similar monitoring requirements. There has been a change in the schedule for monitoring. EPA requests comment upon the difference between the monitoring requirements set out for automobile salvage yard facilities in the September 1992 General Permits and

those required in today's proposed permit.

7. Alternative Monitoring Requirements

EPA requests comment upon the following monitoring and reporting requirements in lieu of those listed in Part XI.M.6 of today's proposed permit.

a. Annual monitoring requirements. During the period beginning on the effective date and lasting through the expiration date of this permit, annual monitoring of storm water discharges associated with industrial activity is required for automobile salvage yards with any of the following: (1) Over 250 auto/truck bodies with drivelines (engine, transmission, axles, and wheels), 250 drivelines, or any combination thereof (in whole or in parts) are exposed to storm water; (2)

over 500 auto/truck units (bodies with or without drivelines in whole or in parts) are stored exposed to storm water; or (3) over 100 units per year are dismantled and drainage or storage of automotive fluids occurs in areas exposed to storm water. These facilities must monitor their storm water discharges for Chemical Oxygen Demand (COD); oil and grease; Total Suspended Solids (TSS); pH; and any pollutant limited in an effluent guideline to which the facility is subject.

Permittees must only collect and analyze a grab sample for these parameters. Permittees are not required to submit monitoring results, unless required in writing by the Director. These monitoring requirements are summarized in the table below.

TABLE M-6.—MONITORING REQUIREMENTS

| Parameter | Unit | Frequency | Sample type |
|------------------------------|---------------|--------------|-------------|
| Total flow | gallons | Annual | estimate. |
| Chemical oxygen demand | mg/L | Annual | grab. |
| Oil and grease | mg/L | Annual | grab. |
| pH | s.u. | Annual | grab. |
| Total suspended solids | mg/L | Annual | grab. |

In addition to the parameters listed in the above table, the permittee shall record the following:

- Date and duration (in hours) of the storm event(s) sampled

- Rainfall measurements (in inches) of the storm event which generated the sampled runoff

- Duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event

- Estimate of the total volume (in gallons) of the each discharge sampled.

b. Quarterly visual examination of storm water quality. (1) Facilities shall perform and document a visual examination of a representative storm water discharge associated with industrial activity from vehicle dismantling areas, vehicle and equipment maintenance areas and parts and equipment cleaning areas. If there are numerous points of discharge from one area, one representative sample may be observed. The examination must be made at least once in each designated period (described in (2) below) during daylight hours unless there is insufficient rainfall or snow melt to produce flow.

(2) Examinations shall be conducted in each of the following periods for the purposes of inspecting storm water quality associated with storm water runoff and snow melt: December to

February (storm water runoff or snow melt); March to May (storm water runoff); June to August (storm water runoff); September to November (storm water runoff or snow melt).

(3) Examinations shall be conducted within the first 30 minutes (or as soon thereafter as practical, but not to exceed 60 minutes) of flow. The examinations shall include any observations of color, odor, turbidity, floating solids, foam, oil sheen, or other obvious indicators of storm water pollution. No analytical tests are required to be performed on these samples. Examinations shall be conducted so as to provide a reasonable representation of the nature of a typical storm water discharge at that site during that time of year.

(4) Information must be maintained onsite and include: the examination date and time, examination personnel, visual quality of the storm water discharge, and probable sources of any observed storm water contamination.

N. Storm Water Discharges Associated With Industrial Activity From Scrap and Waste Material Processing and Recycling Facilities

Specific requirements have been established for those facilities that are engaged in the processing, reclaiming and wholesale distribution of scrap and recyclable waste materials. As background, the storm water regulations

define 11 categories of storm water discharges associated with industrial activity in 40 CFR 122.26(b)(14). Category (vi) includes facilities that are engaged in the recycling of materials, including metal scrapyards, battery reclaimers, and salvage yards, including but limited to those classified Standard Industrial Classification (SIC) 5093. For purposes of this section, special conditions have been proposed for those facilities engaged in the reclaiming and retail/wholesale distribution of used motor vehicle parts identified as SIC 5015 in Part XI.M.

SIC 5093 includes establishments engaged in assembling, breaking up, sorting and the wholesale distribution of scrap and recyclable waste materials including bag, bottle and box wastes, fur cuttings, iron and steel scrap, metal and nonferrous metal scrap, oil, plastics, rags, rubber, textiles, waste paper and rag wastes. This section establishes conditions that are also applicable to those activities that are typically associated with SIC 5093 that are engaged in the recycling and/or reclamation of liquid wastes including, but not limited to, used solvents, oil, mineral spirits, and ethylene glycol (antifreeze). This section, including Best Management Practices (BMPs), monitoring requirements, and pollution prevention plan requirements, is organized by facilities that process and

recycle nonliquid wastes versus those that reclaim and recycle liquid wastes. Facilities that participated in U.S. Environmental Protection Agency (EPA) Group Permit Applications 195, 274, 467, 647 (except facilities identified as SIC 4212), 826, 1035, 1145 and 1204 are eligible for coverage under this section.

When an industrial facility, described by the above eligibility provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

If monitoring and pollution prevention plan requirements of another industrial activity section of this permit apply to co-located industrial activities

at an industrial facility, the eligibility provisions of that industrial activity section shall not preclude the operator of the industrial facility from complying with the applicable monitoring and pollution prevention plan requirements of that section.

1. Pollutants Found in Storm Water Discharges

This fact sheet is organized into two major subsections, those industrial activities engaged in the processing and recycling of scrap and waste materials (nonliquid recyclable wastes) and those industrial activities engaged in reclaiming and recycling liquid materials, e.g., used oils, solvents, mineral spirits and antifreeze. Industrial operations and BMPs associated with these two groups are largely dissimilar. Therefore, conditions for each of these two groups are identified separately.

a. Scrap and waste recycling facilities (SIC 5093) (nonliquid recyclable wastes). The scrap and waste recycling industry reclaims, processes and provides wholesale distribution of a diversity of materials and products. Typical recyclable materials include ferrous and nonferrous metals, paper, cardboard, glass and plastic. Inbound recyclable materials are processed

onsite in order to achieve a uniform grade product that meets a particular manufacturer's specifications. A significant inventory of processing equipment is frequently required to process the recyclable waste material into a uniform grade. Processing equipment typically employ enormous physical forces such as shearing, shredding, and compacting in the process of eventually achieving a desired uniform grade product.

Individual scrap and waste recycling facilities may process one or more types of recyclable materials at a single site. Depending on the requirements of a manufacturer, recyclable waste materials, e.g., paper and cardboard, may need to be stored under cover to prevent deterioration. The bulk size of the recyclable waste materials and the processing equipment associated with these facilities frequently necessitates stockpiling materials and equipment outdoors. Consequently, there is significant opportunity for exposure of storm water runoff to pollutants. The extent of material potentially exposed to storm water runoff is illustrated in the following table based on information provided from one group application consisting of approximately 1100 members.

TABLE N-1.—PERCENTAGE OF APPLICANTS IN ONE GROUP APPLICATION THAT PROVIDE COVER OVER MATERIALS OR PROCESSES

| Material/processes | Percent of applicants |
|-------------------------------------|-----------------------|
| Ferrous Materials | 6.6 |
| Nonferrous Materials | 53 |
| Glass/plastic/paper | 14 |
| Other Materials | 1.7 |
| Material Processing Equipment | 43 |

There are at least four types of activities that are common to most scrap and waste recycling facilities, they include: scrap waste material stockpiling, material processing, segregating processed materials into uniform grades, and collecting nonrecyclable materials for disposal. This fact sheet outlines pollutants of concern associated with each of these types of activities. Other operations of concern, including vehicle and equipment maintenance, are also discussed in this fact sheet.

(1) *Pollutants associated with material stockpiling.* During material stockpiling, including unloading and loading areas, the potential exists for some types of inbound recyclable materials to deposit residual fluids on the ground. Used automotive engines, radiators, brake fluid reservoirs,

transmission housings, and lead-acid from batteries may contain residual fluids that, if not properly managed, can eventually come in contact with storm water runoff. For example, sampling data from two group applications indicated the presence of oil and grease in 103 individual grab samples. In response to other Federal and State environmental regulations, such as the Resource Conservation and Recovery Act (RCRA), many scrap and waste material facilities have instituted inspection and supplier education programs to minimize or eliminate the amount of inbound recyclable materials containing fluids and other potentially hazardous materials prior to their acceptance. Part XI.N.3.c.(1)(a) of today's proposed permit imposes conditions that will make an inbound

recyclable materials inspection program part of the pollution prevention plan.

Another concern of outdoor stockpiling, including unloading and loading areas, is associated with deterioration of materials. Metal surfaces that are stockpiled for extended periods may be subject to corrosion. Corrosion is the deterioration of metal surfaces that typically results in the loss of metal to a solution, i.e., water. The following metals are referred to as the galvanic (or electromotive) series and have a tendency to corrode and become soluble in water; magnesium, aluminum, cadmium, zinc, steel or iron, cast iron, chromium, tin, lead, nickel, soft and silver solder, copper, stainless steel, silver, gold, platinum, brass and bronze. For some metals, the extent and rate of corrosion is dependent on

whether it occurs in an oxygen-starved or oxygen-abundant atmosphere.

Corrosion of stockpiled materials at scrap recycling facilities is a potential source of pollutants given that metals such as copper, lead, nickel, zinc, chromium and cadmium were frequently detected in sampling data. In addition, the majority of these metals are associated with recyclable materials handled by the scrap recycling industry. Part XI.N.3.a.(3) of today's proposed

permit identifies BMP options to address these sources.

Another significant material of concern is the reclaiming of scrap lead acid batteries from automotive vehicles and equipment. If a battery casing becomes cracked or damaged, special precautions are necessary to ensure that the contents do not come in contact with storm water runoff. This includes battery terminals with visible corrosion. In all cases, used batteries shall be

handled and stored in such a manner as to prevent exposure to either precipitation or runoff. Part XI.N.3.a.(3) addresses proposed conditions for these sources.

The following table presents a list of typical materials that may be received and processed at a scrap and waste recycling facility and which may be potential pollutant sources if they are not managed properly.

TABLE N-2.—SIGNIFICANT MATERIALS POTENTIALLY EXPOSED TO STORM WATER RUNOFF AT SCRAP AND WASTE RECYCLING FACILITIES¹

| Significant materials | Potential sources | Pollutants of concern |
|--|--|---|
| White goods (appliances) | Leaking oil-filled capacitors, ballasts, leaking compressors, pumps, leaking pressure vessels, reservoirs, sealed electrical components and chipped or deteriorated painted surfaces. | PCBs, oil, lubricants, paint pigments or additives such as lead, and other heavy metals, |
| Ferrous and nonferrous turnings and cuttings .. | Cutting oil residue, metallic fines | Oil, heavy metals. |
| Materials from demolition projects | Deteriorated/damaged insulation, chipped painted surfaces, lead, copper, and steel pipes. | Asbestos fibers, lead, copper, zinc, cadmium, other metals, TKN. |
| Electrical components, transformers, switch gear, mercury float switches, sensors. | Leaking oil-filled transformer casings, oil-filled switch, float switches, radioactive materials in gauges, sensors. | PCBs, oils, mercury, ionizing radioactive isotopes. |
| Fluorescent lights, light fixtures | Leaking ballasts | PCBs, oil. |
| Food/beverage dispensing equipment | Leaking fluorescent light ballasts, chipped painted surfaces. | PCBs, oil, heavy metals from paint pigments and additives. |
| Hospital and dental waste and equipment | Drums/containers of hospital waste, shielding from diagnostic and other medical equipment, radioactive materials from gauges, sensors and diagnostic equipment. | Infectious/bacterial contamination, lead, ionizing radioactive isotopes. |
| Instruments | Radioactive material from thickness gages | Ionizing radioactive isotopes. |
| Insulated wire | Insulation and other coatings, wire | Lead, zinc, copper. |
| Lawnmowers, snowmobiles, motorcycles | Leaking engines, transmissions, fuel, oil reservoirs, leaking batteries. | Oils, transmission and brake fluids, fuel, grease, battery acid, lead acid. |
| Light gage materials | Deteriorating insulation, painted surfaces and other coatings. | Asbestos, lead, chromium. |
| Locomotives, rail cars | Leaking fuel reservoirs, fittings, hydraulic components, engines, bearings, compressors, oil reservoirs, worn brake pads, damaged insulation. | PCBs, diesel fuel, hydraulic oil, oil, brake fluid, grease from fittings, asbestos. |
| Motor vehicle bodies, engines, transmissions, exhaust systems. | Leaking fuel tanks, oil reservoirs, transmission housings, brake fluid reservoir and lines, brake cylinders, shock absorber casing, engine coolant, wheel weights, leaking battery casings/housings and corroded terminals, painted surfaces and corrosion inhibitors, exhaust system, catalytic converters. | Fuel, benzene, oil, hydraulic oil, transmission fluids, brake fluids, ethylene glycol (anti-freeze), lead, lead acid, lead oxides, cadmium, zinc, other heavy metals. |
| Miscellaneous machinery and obsolete equipment. | Leaking reservoirs, damaged or chipped painted surfaces/coatings. | Fuel, oil, lubricants, lead, cadmium, zinc. |
| Pipes/materials from chemical and industrial plants. | Chemical residue, insulation, lead piping, chipped or damaged painted surfaces and protective coatings. | Chemical residue, oil, lubricants, damaged insulation (asbestos), lead, cadmium, zinc, copper. |
| Sealed containers, hydraulic cylinders | Leaking liquid reservoirs, containers, cylinders, miscellaneous chemicals. | Oil, PCBs, solvents, chemical residue. |
| Salvaged construction materials | Chemical residues, oils, solvents, lubricants, damaged insulation, chipped painted surfaces and protective coatings. | Chemical residue, oily wastes, asbestos, lead, cadmium, zinc. |
| Tanks, containers, vessels, cans, drums | Leaking or damaged containers | Chemical residue, oily wastes, petroleum products, heating oil. |
| Transformers (oil filled) | Leaking transformer housings | PCBs, oil. |

¹ Institute of Scrap Recycling Industries, Inc.'s "Environmental Operating Guidelines." (April 1992).

(2) *Material processing.* The type of processes employed at a particular facility depends on the type of

recyclable and waste material. Typical processes include: torch cutting, shredding, baling, briquetting, wire

stripping and chopping, and compacting. Processes such as shredding and shearing reduce the bulk

size of recyclable scrap and waste into a size that is more easily transportable and which allows separation into uniform grades based on manufacturer specifications. Processes such as shredding of automotive bodies include a means of segregating materials into their ferrous and nonferrous fractions.

Process equipment at scrap and waste recycling facilities are also potential sources of pollutants in storm water runoff. The sources of concern will be discussed separately. Scrap process equipment such as shearers are often actuated by a hydraulic system. Components such as hydraulic reservoirs, hydraulic pumps, motors, cylinders, control valves, accumulators, filters, and fittings are prone to leaking hydraulic fluid. Some hydraulic machinery also require frequent lubrication of cutting and wear surfaces. Storm water runoff exposure to hydraulic fluids and other lubricants is very likely unless adequate source control measures such as good housekeeping, preventive maintenance,

diversion and/or containment are provided.

Stationary process equipment also produce a substantial amount of residual particulate material that tends to accumulate on and around the equipment, particularly rotating machinery, moving parts, bearings, conveyors and at the output of the equipment, e.g., storage containers. Particulate material that accumulates can become a source of contamination if it comes in contact with both precipitation and storm water runoff. Other sources of residual particulate and waste material include air pollution equipment, material handling equipment and processing equipment. In the case of shredding equipment, there are typically three (3) separate material streams produced. Shredded material is ultimately separated into its ferrous and nonferrous fractions, and a third stream referred to as fluff. The fluff material consists of a heterogeneous mix of materials including, but not limited to, small metal fragments, plastics,

rubber, wood and textiles. After the material exits the shredder (hammermill), it typically enters an air classification system that separates the lightweight fraction, e.g., particulates, from the more dense fraction. The ferrous metal fraction is then separated from the nonferrous fraction and fluff by the use of a magnetic separator (typically a belt- or drum-type magnetic separator). The separated material may be collected in a hopper or it may accumulate on the ground. If recyclable and nonrecyclable waste material is allowed to accumulate on the ground, a greater potential exists for this material to come in contact with either precipitation or storm water runoff.

The scrap and recycling industry uses a diversity of processes to reclaim and recycle materials that can contribute pollutants to storm water runoff. The following table presents a list of typical scrap equipment operations which are potential pollutant sources.

TABLE N-3.—TYPICAL PROCESS AND EQUIPMENT OPERATIONS THAT ARE LIKELY SOURCES OF POLLUTANTS¹

| Activity | Potential sources | Pollutants of concern |
|---|---|---|
| Air Pollution Equipment (including incinerators, furnaces, wet scrubbers, filter houses, bag houses). | Normal equipment operations that include the collection and disposal of filter bag material and ash, process wastewater from scrubbers, accumulation of particulate matter around leaking joint connections, malfunctioning pumps and motors, e.g., leaking gaskets, seals or pipe connections, leaking oil-filled transformer casings. | Hydraulic fluids, oils, fuels, grease and other lubricants, accumulated particulate matter, chemical additives, PCBs from oil-filled electrical equipment. |
| Combustion Engines | Spills and/or leaks from fueling tanks, spills/leaks from oil/hydraulic fuel reservoirs, faulty/leaking hose connections, worn gaskets, leaking transmission crankcases and brake systems (if applicable), leaking battery casings and/or corroded terminals. | Accumulated particulate matter, oil/lubricants, fuel (gas/diesel), fuel additives, antifreeze (ethylene glycol), battery acid, products of incomplete combustion. |
| Material Handling Systems (forklifts, cranes, conveyors). | Normal operations including spills and leaks from fuel tanks, hydraulic and oil reservoirs due to malfunction parts, e.g., worn gaskets and parts, leaking hose connections, and faulty seals. Damaged or faulty electrical switches (mercury filled) Damaged or leaking battery casings, including exposed corroded battery terminals. Damaged or worn bearing housings. | Hydraulic fluids, oils, fuels and fuel additives, grease and other lubricants, accumulated particulate matter, chemical additives, mercury, lead, battery fluids. |
| Stationary Scrap Processing Facilities (balers, briquetters, shredders, shearers, compactors, engine block/cast iron breakers, wire chopper, turnings crusher). | Normal equipment operations including leaks from hydraulic reservoirs, hose and fitting connections, worn gaskets, spills or leaks from fuel tanks, particulates/residue from scrap processing, malfunctioning pumps and motors, e.g., leaking gaskets, seals or pipe connections, leaking oil-filled transformer casings. | Heavy metals, e.g., zinc, copper, lead, cadmium, chromium, hydraulic fluids. |
| Hydraulic equipment and systems, balers/briquetter, shredders, shearers, compactors, engine block/cast iron breaker, wire chopper, turnings crusher. | Particulate/residue from material processing, spills and/or leaks from fueling tanks, spills/leaks from oil/hydraulic fuel reservoirs, faulty/leaking hose connections/fittings, leaking gaskets. | Hydraulic fluids/oils, lubricants, particulate matter from combustion engines, PCBs (oil-filled electrical equipment components), heavy metals (nonferrous, ferrous). |
| Electrical Control Systems (transformers, electrical switch gear, motor starters). | Oil leakage from transformers, leakage from mercury float switches, faulty detection devices. | PCBs, mercury (float switches), ionizing radioactive material (fire/smoke detection systems). |

TABLE N-3.—TYPICAL PROCESS AND EQUIPMENT OPERATIONS THAT ARE LIKELY SOURCES OF POLLUTANTS—
Continued

| Activity | Potential sources | Pollutants of concern |
|---------------------|---|-------------------------------|
| Torch cutting | Residual/accumulated particulates | Heavy metal fragments, fines. |

¹Institute of Scrap Recycling Industries, Inc.'s "Environmental Operating Guidelines." (April 1992).

(3) *Segregation of processed materials into uniform grades.* Processing, e.g., shearing, shredding, baling, etc., of recyclable materials is followed by its segregation into uniform grades to meet a particular manufacturer's specifications. If segregated recyclable material remains exposed to precipitation, the potential still exists for storm water contamination.

(4) *Disposal of nonrecyclable waste materials.* During recycling of scrap and waste materials, a significant fraction is nonrecyclable waste materials and must be disposed. The volume or quantity of material that remains unrecyclable may be too large to permit covered storage prior to shipment. Consequently, unrecyclable waste materials may be left exposed to both precipitation and runoff and, therefore, they are a likely source of storm water pollutants.

(5) *Other operations of concern.* There are a number of activities that frequently occur at scrap and waste recycling facilities including, heavy vehicle traffic

over unstabilized areas, vehicle maintenance and fueling, and material handling operations. Operations associated with the receipt, handling, and processing of scrap and waste material frequently occur over areas that are not stabilized to prevent erosion. Unless specific measures or controls are provided to either prevent erosion or trap the sediment, this material will be carried away in storm water runoff and eventually exit the site. Suspended solids are of significant concern given the potential amount of unstabilized area and the significant amount of particulate matter that is often produced at these facilities. Both organic and inorganic pollutants can become bound up or absorbed to suspended solids in runoff. For this reason, today's proposed permit identifies conditions to minimize the contribution of suspended solid loadings from these facilities.

Some scrap and waste recycling facilities may also conduct vehicle

maintenance onsite. Although many of these activities frequently occur indoors, there are specific activities which could contribute pollutants to storm water. This includes washdown of vehicle maintenance areas, leaks or spills of fuel, hydraulic fluids and oil and outdoor storage of lubricants, fluids, oils and oily rags. Fueling stations are also frequently conducted outdoors without any roof cover. Activities such as topping off fuel tanks, or overfilling storage tanks (without high-level alarms) are also activities that can cause contamination of runoff. One last activity of concern is vehicle washing which can result in accumulated residue material being discharged to a storm sewer system.

The following table highlights activities associated with vehicle maintenance and material handling that are potential sources of storm water contamination.

TABLE N-4.— OTHER POTENTIAL POLLUTANT SOURCE ACTIVITIES

| Activity | Potential sources | Pollutants of concern |
|---|--|--|
| Material Handling Systems (forklifts, cranes, conveyors). | Spills and/or leaks from fueling tanks, spills/leaks from oil/hydraulic fuel reservoirs, faulty/leaking hose connections/fittings, leaking gaskets. | Accumulated particulate matter (ferrous and nonferrous metals, plastics, rubber, other), oil/lubricants, PCBs (electrical equipment), mercury (electrical controls), lead/battery acids. |
| Vehicle Maintenance | Parts cleaning, waste disposal of rags, oil filters, air filters, batteries, hydraulic fluids, transmission fluids, brake fluids, coolants, lubricants, degreasers, spent solvents. | Fuel (gas/diesel), fuel additives, oil/lubricants, heavy metals, brake fluids, transmission fluids, chlorinated solvents, arsenic. |
| Fueling Stations | Spills and leaks during fuel transfer, spills due to "topping off" tanks, runoff from fueling areas, washdown of fueling areas, leaking storage tanks, spills of oils, brake fluids, transmission fluids, engine coolants. | Gas/diesel fuel, fuel additives, oil, lubricants, heavy metals. |
| Vehicle and Equipment Cleaning and Washing | Washing and steam cleaning | Solvent cleaners, oil/lubricants/additives, anti-freeze (ethylene glycol). |

(6) *Pollutants found in storm water discharges.* Sampling data provided in part 2 of the group application process revealed that storm water discharges from scrap and waste recycling facilities contain pollutants such as heavy metals,

Biochemical Oxygen Demand (BOD), Chemical Oxygen Demand (COD), TSS, nutrients and oil and grease. The following table summarizes the statistical analysis of sampling data provided in part 2 group applications.

Table N-6 provides a comparison of a selected subset of these pollutants to freshwater acute criterion provided in EPA's "Gold Book."

¹ Based on aquatic life criteria.² At freshwater acute concentration (aquatic life) at hardness of 100 mg/L. Toxicity decreases as hardness increases.³ Oil and Grease (aquatic life) 0.01 of the lowest continuous flow 96-hour LC50.⁴ Varies depending on chemical speciation.

The comparison of sampling results for metals to "goldbook" values indicates that storm water discharges originating from these facilities were substantively higher than the acute freshwater criterion. Given the frequency that these metals were reported in storm water discharges, another principal concern is the synergistic, additive and antagonistic effects that all these constituents may have on water quality. In addition, sampling data also indicates the presence of several congeners of PCBs, polycyclic aromatic hydrocarbons and phthalate esters. When taken in whole,

storm water discharges from these facilities are often a complex matrix of metals, suspended solids, and organic compounds.

b. Waste recycling facilities (SIC 5093)—(liquid recyclable wastes). This subsection applies to those facilities engaged in the reclaiming and recycling of liquid wastes such as "spent solvents," "used oil," and "used ethylene glycol" typically identified under SIC 5093. This subsection is particularly applicable to those facilities that participated in EPA group application number 195. EPA received a single group application in this category

of waste recycling facilities. The following is a profile of industrial activities and the types of significant materials associated with facilities participating in this group activity.

Group application number 195 included 220 facilities of which 214 were classified as service centers. Service centers accumulate spent solvent, used oil and antifreeze, filter cartridges and still bottoms contaminated with dry cleaning solvents (typically perchloroethylene), and used lacquer thinner from paint gun cleaning machines. The typical service center has a total storage capacity

limited to approximately 10,000 gallons in individual containers and tanks with a maximum storage capacity of 20,000 gallons each. Service centers are typically limited to a maximum of 6 tanks (a total of 120,000 gallons). Twenty (20) of the service centers also function as accumulation centers where they have a maximum storage capacity of 70,000 gallons of liquid materials in containers. None of the containers are

opened except under conditions where a container begins to leak or is damaged.

The group application also included four (4) facilities that operated only as container transfer stations and do not operate storage tanks. These facilities are largely enclosed warehouses that provide secondarily contained storage areas. Three (3) facilities were identified as used oil depots where only oily water and/or used oil are accumulated in

storage tanks. Storage tanks are limited to a maximum capacity of 20,000 gallons each. Used oil is transported to the facility in tanker trucks (3,500 gallons) and shipped out in tanker trucks (7,500 gallons). The used oil is ultimately transported to a processing or re-refining facility (not covered under this section). The following table summarizes the percentage of facilities with significant materials stored.

TABLE N-7.—SIGNIFICANT MATERIALS REPORTED IN GROUP APPLICATION NUMBER 195

| Significant materials | Percent of facilities |
|----------------------------|-----------------------|
| Mineral spirits | 98 |
| Immersion cleaner | 98 |
| Dry cleaner solvents | 98 |
| Paint solvents | 83 |
| Industrial solvents | 81 |
| Spent antifreeze | 59 |
| Used oil | 57 |
| Allied products | 98 |

The types of materials identified in Table N-7 are potential sources of storm water runoff contamination. Since these materials are stored and transported in individual drums and bulk storage tanks, the potential exists for spills and/or leaks during all phases of waste transport, waste transfer, container/drum handling and shipping.

There are a number of operations at these facilities that have significant potential to release pollutants to the environment if recyclable waste materials are not managed properly.

Potential sources of pollutants are discussed in Part N.2.a.1 of today's proposed permit. However, in response to other Federal and State environmental regulations, such as RCRA and 40 CFR part 112 (Oil Pollution Prevention), facilities in this group application currently employ a range of the BMPs and structural controls that also benefit storm water quality. Typical measures and controls for controlling pollutants for facilities in

this subsection are presented in Part N.2.b.

(1) *Waste material handling and storage.* Given the nature and type of materials stored and handled at these facilities, the potential exists for accidental spills and leaks. Consequently, the types of activities that occur at these facilities which could potentially result in contamination of storm water runoff is also of concern to EPA. The following table is a list of activities which may result in a release of pollutants.

TABLE N-8.—TYPES OF POTENTIAL POLLUTANT-CAUSING ACTIVITIES AT WASTE RECYCLING FACILITIES THAT HANDLE LIQUID RECYCLABLE WASTES

| Activity | Potential sources of pollutants | Pollutants of concern |
|--|--|---|
| Drum/individual container storage and handling | Leaks or spills due to faulty container/drum integrity, e.g., leaking seals or ports. Container materials incompatible with waste material. Improper stacking and storage of containers. | Mineral spirits, industrial solvents, immersion cleaners, dry cleaner solvents, paint solvents, spent antifreeze. |
| Return and fill stations | Leaks, spills, or overflows from tanker truck transfer of wastes and hose drainage. Leaking pipes, valves, pumps, worn or deteriorated gaskets or seals. | Mineral spirits, industrial solvents, immersion cleaners, dry cleaner solvents, paint solvents, spent antifreeze. |
| Individual container/drum storage improper stacking and storage of containers. | Leaks or spills due to faulty container/drum integrity, e.g., leaking seals or ports. | Mineral spirits, industrial solvents, immersion cleaners, dry cleaner solvents, paint solvents, spent antifreeze. |
| Storage tank operations | Overfill of storage tanks, leaking pipes, valves, worn or deteriorated pumps seals. Leaking underground storage tanks. | Mineral spirits, industrial solvents, immersion cleaners, dry cleaner solvents, paint solvents, spent antifreeze. |
| Material handling equipment | Leaking fuel lines, worn gaskets, leaking hydraulic lines and connections. | Fuel, hydraulic fluid, oil and grease. |

(2) *Other activities of concern.* The following table highlights other types of activities that are potential sources of storm water contamination.

TABLE N-9.—OTHER POTENTIAL SOURCES OF STORM WATER CONTAMINATION

| Activity | Potential sources of pollutants | Pollutants of concern |
|--|---|---|
| Vehicle and equipment maintenance (if applicable). | Replacement of fluids such as transmission and brake fluids, antifreeze, oil and other lubricants, washdown of maintenance areas, dumping fluids down floor drains connected to storm sewer system, outside storage of fluids and oily rags and waste material. | Oil and grease, fuel, accumulated particulate matter, antifreeze. |
| Vehicle or equipment washing (if applicable) | Wash water or steam cleaning | Oil, detergents, chlorinated solvents, suspended solids and accumulated particulate matter. |

(3) *Pollutants found in storm water discharges.* Based on data provided in group application sampling information, pollutants that were most frequently

reported included TSS, BOD, COD, nitrite plus nitrate, oil and grease. The following table provides a statistical summary of data.

TABLE N-10.—SUMMARY STATISTICS FOR WASTE RECYCLING FACILITIES¹ (SIC 5093)—(RECYCLABLE LIQUID WASTES). ALL VALUES IN MG/L

| Parameter | Number of samples | | Mean | | Min | | Max | | Median | | 99th Percentile | |
|-------------------------|-------------------|-----|------|------|------|------|------|------|--------|------|-----------------|------|
| | | | Grab | Comp | Grab | Comp | Grab | Comp | Grab | Comp | Grab | Comp |
| BOD ₅ | 22 | 17 | 18 | 9 | 2 | 2 | 94 | 48 | 5 | 5 | 79 | 38 |
| COD | 22 | 17 | 133 | 83 | 12 | 5 | 660 | 400 | 45 | 45 | 449 | 320 |
| TSS | 21 | 16 | 51 | 28 | 5 | 5 | 500 | 84 | 28 | 20 | 68 | 59 |
| Nitrite + Nitrate | 22 | 17 | 0.90 | 0.78 | 0.05 | 0.05 | 3.70 | 3.50 | 0.61 | 0.38 | 3.45 | 3.29 |
| TKN | 22 | 17 | 3.1 | 2.0 | 1.0 | 1.0 | 11.0 | 6.0 | 1.5 | 1.0 | 9.9 | 5.7 |
| Oil and grease | 22 | N/A | 1.8 | N/A | 1.0 | N/A | 5.0 | N/A | 1.5 | N/A | 4.0 | N/A |

¹ Applicants that did not report the units of measurement for the reported values were not included in these statistics.

² Composite samples.

Table N-10 indicates that, with the exception of BOD and COD, average concentrations in grab and composite samples were comparable with average values reported in the NURP study (NURP did not measure oil and grease). The data also indicates that pollutants such as industrial solvents were all below detection limits (without values). In the case of oil and grease, all concentration values were below the reportable concentration of 10 mg/L (see 40 CFR 110.10 and 117.21).

2. Options for Controlling Pollutants

a. *Scrap and waste recycling facilities (SIC 5093) (nonliquid recyclable waste materials).* This section addresses source control measures, BMPs and

structural controls that are specifically applicable to the scrap waste and recycling facilities (SIC 5093) and which are engaged in the reclaiming and recycling of solid materials such as ferrous and nonferrous metals, plastics, paper, glass and cardboard and automotive parts. Part XI.N.2.b. of the permit addresses waste recycling facilities (SIC 5093) that are engaged in the reclaiming and recycling of liquid wastes such as used oils, industrial solvents and ethylene glycol.

The BMPs described in this subsection are specifically applicable to scrap and waste recycling facilities. Scrap and waste recycling facilities applying for coverage under Part XI.N. of today's proposed permit shall employ

a broad and comprehensive range of BMPs and source control measures to minimize and/or eliminate the diversity of pollutants associated with scrap processing operations and inbound recyclable materials. In instances where facilities conduct certain operations indoors or under cover, a determination will be made by the owner/operator of the facility as to the applicability of these BMPs and source control measures to these particular activities.

The following table summarizes alternative source control measures, nonstructural BMPs (BMPs), and structural controls that are associated with and applicable to scrap and waste processing facilities (SIC 5093) (nonliquid recyclable materials).

TABLE N-11.—Summary of Alternative BMP Options for Scrap and Waste Recycling Processing Facilities

| Activity | BMP alternatives |
|--|--|
| Inbound recyclable and waste material control: | <p>Establish program to encourage suppliers of scrap, waste and other salvageable materials to drain residual fluids prior to arrival at the facility.</p> <p>Establish acceptance program for handling, storage and disposal of lead-acid batteries.</p> <p>Establish procedures for rejecting or handling, storing and disposal of hazardous wastes and other nonhazardous residual fluids.</p> <p>Establish procedures to properly handle industrial turnings and cuttings and prohibiting cutting oils and metallic fines from coming in contact with runoff.</p> <p>Identify inspector training requirements.</p> |
| Outside Scrap Material Storage: (liquids) | <p>Conduct inspections for fluids, e.g., oils, transmission fluids, antifreeze, brake fluid, and fuels. Establish handling/ storage/disposal procedures for these materials.</p> |

TABLE N-11.—Summary of Alternative BMP Options for Scrap and Waste Recycling Processing Facilities—
Continued

| Activity | BMP alternatives |
|---|---|
| Outside Scrap Material Storage: (bulk solid materials). | <p>Drain and collect liquids in a designated area. Provide covered storage or impervious areas with curbing/berms or other appropriate containment. Stored liquid materials in covered areas or impervious areas with curbing/berms or other appropriate measure.</p> <p>Establish spill prevention procedures.</p> <p>Provide adequate supply of materials for dry clean up of spills or leaks.</p> <p>Prevent runoff into liquid storage areas. Store liquid wastes in materially compatible containers. Minimize/eliminate the accumulation of liquid wastes.</p> <p>Establish procedures if hazardous wastes are discovered after material accepted.</p> <p>Conduct periodic inspections of storage areas.</p> <p>Conduct preventative maintenance of BMPs as necessary.</p> <p>Minimize runoff from coming into areas where significant materials are stored, e.g., diversion structures such as curbing, berms, containment trenches, surface grading, and elevated concrete pads or other equivalent measure.</p> <p>Use adsorbents to collect leaking or spills of oil, fuel, transmission and brake fluids, e.g., dry absorbent, drip pans.</p> <p>Install media filters such as catch basin filters and sand filters.</p> <p>Install oil/water separator in storage areas with vehicle transmissions and engines. Locate spill plans under stored vehicles.</p> <p>Provide nonrecyclable waste storage bins and containers.</p> <p>Conduct periodic inspections.</p> <p>Conduct preventative maintenance as necessary.</p> |
| Storage Other: (lightweight materials) | <p>Provide equipment operator training to minimize damage to controls, e.g., curbing and berms.</p> <p>Identify/provide supplier training or information bulletins on requirements for acceptance of lightweight materials.</p> <p>Encourage supplier participation in program to minimize/eliminate, as practicable, volume of semisolid and liquid residues in recyclable materials, e.g., residual fluids in aluminum and plastic containers.</p> <p>Provide covered storage, container bins or equivalent for lighter-weight materials such as glass, plastics, aluminum cans, paper, cardboard.</p> <p>Minimize/eliminate residue from bottles, containers, etc. from coming in contact with runoff. Establish dry clean up methods.</p> <p>Establish procedures and employee training for the handling, storage and disposal of residual fluids from small containers.</p> <p>Prohibit washdown of tipping floor areas.</p> <p>Provide good housekeeping to eliminate particulate and residual materials buildup. Establish cleaning schedule for high traffic areas.</p> <p>Provide covered disposal containers or equivalent for residual waste materials.</p> <p>Eliminate floor drains discharging to storm sewer.</p> |
| Scrap processing operations: | <p>Provide training to equipment operators on how to minimize exposure of runoff to scrap processing areas.</p> <p>Schedule frequent cleaning of accumulated fluids and particulate residue around all scrap processing equipment.</p> <p>Schedule frequent inspections of equipment for spills or leakage of fluids, oil, fuel, hydraulic fluids.</p> <p>Conduct routine preventive maintenance of equipment per original manufacturer's equipment (OME) recommendations. Replace worn or malfunctioning parts.</p> <p>Site process equipment on elevated concrete pads or provide runoff diversion structures around process equipment, berms, containment trenches or surface grading or other equivalent measure. Discharge runoff from within bermed areas to a sump, oil/water separator, media filter or discharge to sanitary sewer.</p> <p>Conduct periodic maintenance and clean out of all sumps, oil/water separators, media filters. Dispose of residual waste materials properly, e.g., according to RCRA.</p> <p>Provide curbing, dikes, and berms around scrap processing equipment to prevent contact with runoff. Where practicable, locate process equipment e.g., balers, briquetters, small compactors, under an appropriate cover.</p> <p>Provide cover over hydraulic equipment and combustion engines.</p> <p>Provide dry-clean up materials, e.g., dry-adsorbents, drip pans, absorbent booms, etc. to prevent contact of hydraulic fluids, oils, fuels, etc., with storm water runoff.</p> <p>Provide alarm, pump shutoff, or sufficient containment for hydraulic reservoirs in the event of a line break.</p> <p>Stabilize high traffic areas, e.g., concrete pads, gravel, pavement, around processing equipment, where practicable.</p> <p>Provide site gages or overflow protection devices for all liquid and fuel storage reservoirs and tanks.</p> <p>Establish spill prevention and response procedures, including employee training.</p> <p>Provide containment bins or equivalent for shredded material, especially lightweight materials such as fluff (preferably at the discharge of these materials from the air classification system).</p> |
| Supplies for Process Equipment | <p>Locate storage drums containing liquids, including oils and lubricants indoors. Alternatively, site palletized drums and containers on an impervious surface and provide sufficient containment around the materials. Provide sumps, oil/water separators, if necessary.</p> <p>Conduct periodic inspections of containment areas and containers/drums for corrosion.</p> <p>Perform preventive maintenance of BMPs, as necessary.</p> <p>Instruct employees on proper material handling and storage procedures.</p> |
| Scrap lead acid battery Program | <p>Establish inspection and acceptance procedures for scrap lead-acid batteries.</p> |

TABLE N-11.—Summary of Alternative BMP Options for Scrap and Waste Recycling Processing Facilities—Continued

| Activity | BMP alternatives |
|--|--|
| Vehicle and equipment maintenance | <p>Provide supplier training on acceptance practices for scrap batteries.</p> <p>Provide employee training on the safe handling, storage and disposition of scrap batteries.</p> <p>Separate all scrap batteries from other scrap materials.</p> <p>Store scrap batteries under cover or equivalent.</p> <p>Establish procedures for the storage, handling, disposition of cracked or broken batteries in accordance with applicable Federal regulations, e.g., RCRA.</p> <p>Establish procedures to collect and dispose of leaking battery acid according to Federal regulations, e.g., RCRA.</p> <p>Provide covered storage or equivalent to prevent exposure to either precipitation or runoff.</p> <p>Establish an inventory of materials used in the maintenance shop that could become a potential pollutant source with storm water runoff, e.g., fuels, solvents, oils, lubricants.</p> <p>Store and dispose of oily rags, filters (oil and air), batteries, engine coolant, transmission fluid, use oil, brake fluid, and solvents in a manner that minimizes potential contact with runoff and in compliance with State and Federal regulations.</p> <p>Label and track recycling of waste materials, e.g., batteries, solvent, used oil.</p> <p>Drain oil filters before disposal or recycling.</p> <p>Drain all fluids from all parts or components that will become scrap material or secondhand parts.</p> <p>Store liquid waste materials in compatible containers.</p> <p>Store and dispose used batteries in accordance with scrap lead acid battery program.</p> <p>Disconnect all floor drains connected to storm sewer system.</p> <p>Prohibit non-storm water discharges, e.g., dumping of used liquids down floor drains and washdown of maintenance areas.</p> <p>Provide employee training on appropriate storage and disposal of waste materials.</p> <p>Provide good housekeeping measures.</p> <p>Conduct inspections of work areas for compliance with BMPs.</p> |
| Fueling | <p>Use spill and overflow protection devices.</p> <p>Provide high level alarm on fuel storage tanks.</p> <p>Minimize/eliminate runoff onto fueling areas.</p> <p>Reduce exposure of fueling areas to precipitation by covering the fueling area.</p> <p>Provide dry adsorbents to clean up fuel spills.</p> <p>Conduct periodic inspections of fueling areas.</p> <p>Instruct personnel on proper fueling procedures.</p> <p>Provide curbing or posts around fuel pumps to prevent collisions during vehicle ingress and egress.</p> |
| Vehicle and equipment washing | <p>Avoid washing vehicles and equipment outdoors</p> <p>Use biodegradable, phosphate free detergents.</p> <p>Recycle wash water.</p> <p>Provide vehicle wash rack with dedicated sediment trap.</p> |
| Outdoor vehicle parking and storage | <p>Use autoshut-off valves on washing equipment.</p> <p>Use drip pans under all equipment and vehicles waiting maintenance.</p> <p>Cover vehicle and equipment storage areas.</p> <p>Conduct inspections of storage and parking areas for leaks and filled drip pans.</p> <p>Provide employee training.</p> |
| Vehicle and equipment painting (where applicable). | <p>Keep paint and solvents away from traffic areas. Conduct sanding and painting in nonexposed areas, e.g., under cover, in accordance with OSHA standards.</p> <p>Cleanup accumulated particulate matter.</p> <p>Minimize overspraying parts.</p> <p>Dispose or recycle paint, solvents and thinner properly.</p> <p>Provide training to employees</p> |
| Erosion and sediment control | <p>Conduct periodic inspections of paint spraying areas.</p> <p>Minimize runoff from adjacent properties, e.g., diversion dikes, berms, or equivalent.</p> <p>Trap sediment at downgradient locations and outlets serving unstabilized areas. This may include filter fabric fences, gravel outlet protection, sediment traps, vegetated or riprap swales, vegetated strips, diversion structures, catch-basin filters, retention/detention basins or equivalent.</p> <p>Runoff containing oil and grease may include the use of absorbent booms or sand filters in front of outlet structures or other equivalent measures.</p> <p>Stabilize all high traffic areas, including all vehicle entrances and exit points.</p> <p>Conduct periodic sweeping of all traffic areas.</p> <p>Conduct inspections of BMPs.</p> <p>Perform preventative maintenance as needed on BMPs.</p> <p>Provide employee training on the proper installation and maintenance of erosion and sediment controls.</p> |

b. *Waste recycling facilities (SIC 5093)—(recyclable liquid wastes).* This section addresses source control measures, BMPs, and structural controls that are specifically applicable to waste recycling facilities (SIC 5093) which are

engaged in such activities as reclaiming and recycling of liquid wastes such as spent solvents, used oil, and used antifreeze (ethylene glycol). Waste recycling facilities applying for coverage under Part XI.N. of today's proposed

permit will be required to employ a comprehensive range of BMPs and source control measures to minimize contact of pollutants with storm water runoff and precipitation. In instances where facilities conduct certain

operations indoors or under cover, a determination will be made by the owner/operator of the facility as to the applicability of these BMPs and source control measures to their particular facility. The following table summarizes the percent breakdown of BMPs that were reported by applicants participating in group application number 195.

TABLE N-12.—TYPES OF BMPs REPORTED IN EPA GROUP APPLICATION NUMBER 195

| BMP | Percent of facilities |
|--|-----------------------|
| Secondary Containment (Includes tanks, piping, and return/fill stations) | 70 |
| Containment Trench (Includes closed loop containment trenches with sumps, sloped floors, and/or berms) | 91 |
| Roof (Includes canvass tent roofs and enclosed structures) | 7 |

TABLE N-12.—TYPES OF BMPs REPORTED IN EPA GROUP APPLICATION NUMBER 195—Continued

| BMP | Percent of facilities |
|---|-----------------------|
| Contingency Plan (serves as Spill Prevention and Countermeasures Control Plan) | 100 |
| Prevention and Preparedness Plan (includes inspection information and general house-keeping procedures) | 100 |

The following table summarizes types of BMPs, and structural control options that are applicable to waste recycling facilities.

TABLE N-13.—TYPES OF BMP OPTIONS APPLICABLE TO LIQUID WASTE RECYCLING FACILITIES

| Activity | BMP alternatives |
|---|---|
| Individual drum/container storage | <p>Ensure container/drums are in good condition. Store waste materials in materially compatible drums. Use containers that meet National Fire Protection Association (NFPA) guidelines.</p> <p>Put individual containers on pallets. Limit stack height of individual containers/drums. Provide straps, plastic wrap, or equivalent around stacked containers to provide stability.</p> <p>Label/mark drums. Segregate hazardous and flammable wastes. Comply with NFPA guidelines for segregation of flammable wastes.</p> <p>Provide adequate clearance to allow material movement and access by material handling equipment.</p> <p>Provide semipermanent or permanent cover over wastes.</p> <p>Provide adequate clearance between stored materials to allow movement and handling.</p> <p>Establish clean up procedures, including the use of dry adsorbents, in the event of spills or leaks.</p> <p>Prohibit washing down of material storage areas. Disconnect or seal all floor drains from storm sewer system.</p> <p>Develop spill prevention, countermeasures and control (SPCC) procedures for all liquid container storage areas. Ensure employees are familiar with SPCC procedures. Schedule/ conduct periodic employee training.</p> <p>Provide secondary containment, dikes, berms, containment trench, sumps, or other equivalent measure, in all storage areas.</p> |
| Bulk liquid storage | <p>Use welded pipe connections versus flange connections. Inspect all flange gaskets for deterioration.</p> <p>Apply corrosion inhibitors to exposed metal surfaces.</p> <p>Provide high level alarms for storage tanks.</p> <p>Provide redundant piping, valves, pumps, motors, as necessary, at all pumping stations. Provide manually activated shutoff valves in the event of spill. Install visible and/or audible alarms in the event of a spill.</p> <p>Install manually activated drainage valves, or equivalent, versus flapper-type drain valves. Provide adequate security against vandalism and tampering.</p> <p>Provide secondary containment around all bulk storage tanks, including berms, dikes, surface impoundments or equivalent. Ensure surfaces of secondary containment areas are adequately sealed to prevent leaks.</p> <p>Provide stationary boxes around all return and fill stations to eliminate/minimize hose drainage and minor waste transfer spills.</p> |
| Waste transfer areas | <p>Provide secondary containment or equivalent measures around all liquid waste transfer facilities.</p> <p>Provide cover over liquid waste transfer areas.</p> |
| Inspections | <p>Establish clean up procedures for minor spills including the use of dry adsorbents.</p> <p>Conduct inspections of all material storage, handling and transfer areas.</p> <p>Document signs of corrosion, worn parts or components on pumps and motors, leaking seals and gaskets.</p> <p>Conduct periodic nondestructive testing (NDT) of all bulk storage tanks for signs of deteriorating structural integrity.</p> |
| Preventive maintenance | <p>Conduct periodic preventive maintenance of all structural controls, replace worn parts on components on valves, pumps, motors per manufacturer's recommendations.</p> |
| Vehicle maintenance (if applicable) | <p>Establish an inventory of materials used in the maintenance shop that could become a potential pollutant source with storm water runoff, e.g., fuels, solvents, oils, lubricants.</p> <p>Store and dispose of oily rags, filters (oil and air), batteries, engine coolant, transmission fluid, use oil, brake fluid, and solvents in a manner that minimizes potential contact with runoff and in compliance with State and Federal regulations.</p> <p>Label and track recycling of waste materials, e.g., batteries, solvent, used oil.</p> <p>Drain oil filters before disposal or recycling.</p> <p>Drain all fluids from all parts or components that will become scrap material or secondhand parts.</p> <p>Store liquid waste materials in compatible containers.</p> <p>Store and dispose used batteries in accordance with scrap lead acid battery program.</p> |

TABLE N-13.—TYPES OF BMP OPTIONS APPLICABLE TO LIQUID WASTE RECYCLING FACILITIES—Continued

| Activity | BMP alternatives |
|--|--|
| Vehicle cleaning (if applicable) | Disconnect all floor drains connected to storm sewer system. Prohibit non-storm water discharges, e.g., dumping of used liquids down floor drains and washdown of maintenance areas. Provide employee training on appropriate storage and disposal of waste materials. Provide good housekeeping measures. Conduct inspections of work areas for compliance with BMPs. Avoid washing vehicles and equipment outdoors. Use biodegradable, phosphate free detergents. Recycle wash water. Provide vehicle wash rack with dedicated sediment trap. Use autoshut-off valves on washing equipment. |
| Training | Provide employee training on proper material handling and storage procedures. Require familiarization with applicable SPCC measures. |

3. Discharges Covered Under This Section

The requirements listed under this section are applicable to storm water discharges from the following activities: facilities that are engaged in the processing, reclaiming and wholesale distribution of scrap and waste materials such as ferrous and nonferrous metals, paper, plastic, cardboard, glass. These types of activities are typically identified in SIC 5093. Facilities that engaged in reclaiming and recycling liquid wastes such as used oil, antifreeze, mineral spirits and industrial solvents and which are classified SIC 5093 are also covered under this section.

4. Special Conditions

The following section identifies special conditions that are applicable to permittees applying for coverage under Part XI.N. of today's proposed permit.

a. Prohibition of non-storm water discharges. This section requires scrap and waste recycling facilities that are typically classified in SIC 5093 to certify that certain non-storm water discharges are not occurring at their facilities. A list of non-storm water discharges that are not authorized by this section has been identified. These discharges are prohibited due to the likelihood these discharges will contain substantial pollutant concentrations. The following non-storm water discharges are not authorized by this section:

- Waste discharges to floor drains or sinks connected to the facilities storm sewer or storm drainage system
- Water originating from vehicle and equipment washing
- Steam cleaning wastewater
- Process wastewaters
- Washwater originating from cleaning tipping floor areas or material receiving areas
- Wastewater from wet scrubbers
- Boiler blowdown

- Noncontact and contact cooling water
- Discharges originating from dust control spray water
- Discharges from oil/water separators and sumps
- Discharges originating from the cleaning out of oil/water separators or sumps
- Discharges from bermed areas with a visible oily sheen or other visible signs of contamination.

The operators of non-storm water discharges must seek coverage for these discharges under a separate National Pollutant Discharge Elimination System (NPDES) permit if discharging to either a municipal separate storm sewer system or to waters of the United States. If such a permit has been issued, a copy of the NPDES permit must be attached to the applicant's storm water pollution prevention plan (the plan). If a permit application has been submitted for a non-storm water discharge, a copy of the application must be attached to the plan.

For facilities that have prohibited discharges identified under this section and which discharge to a sanitary sewer system, the facility operator is required to notify the operator of the sanitary sewer system in writing. The notification should be attached to the plan. However, for facilities that have been issued an industrial user permit under the pretreatment program for discharges prohibited under this section, a copy of the permit must be attached to the plan. In all instances, the permit applicant must document how non-storm water discharges are disposed and provide the pertinent documentation of that disposal practice within the plan.

5. Storm Water Pollution Prevention Plan Requirements

a. Contents of the plan. In addition to the supplemental information requirements identified in Part VI.C.,

scrap and waste recycling facilities in SIC 5093 are required to provide the additional information applicable to their industrial sector. Each subsection of the storm water pollution prevention plan is broken out into two subcategories; scrap and waste recycling facilities (nonliquid materials) and waste recycling facilities (liquid materials).

(1) Description of potential pollutant sources—(a) Scrap and Waste Recycling Facilities (nonliquid recyclable wastes)—Under description of potential pollutant sources, this section proposes that scrap and waste recycling facilities will provide a description of potential pollutant sources in areas with stockpiled scrap and waste materials, bulk liquid storage or containerized liquids, scrap and waste processing equipment, material loading and unloading, air pollution control equipment, waste treatment, storage, and disposal, processed scrap material, and metal particulates. Metal cuttings and turnings should be segregated from other scrap materials and should be stored in an appropriately covered area. The plan should also address measures to collect any residual fluids. Due to the tendency for these materials to contain residual cutting fluids, runoff or precipitation that comes in from these turnings and cuttings shall be discharged into a sump, sanitary sewer, oil/water separator or other equivalent measure to prevent the discharge of significant quantities of oil.

(i) Scrap and waste material stockpiles (outdoors)—The plan will address areas where significant materials are exposed to either storm water runoff or precipitation. The plan must describe those measures and controls used to minimize contact of storm water runoff with stockpiled materials. The plan should include measures to minimize the extent of storm water contamination from these

areas. The following types of BMPs shall be considered within the plan:

- Promoting the diversion of runoff away from these areas through such practices as dikes, berms, containment trenches, culverts and/or surface grading;
- Permanent or semipermanent covers, or other similar forms of protection over stockpiled materials. This may include the use of containment bins, covered containers and dumpsters for processed scrap and other recyclable and nonrecyclable waste materials;
- Retention and detention basins, ponds, sediment traps and/or vegetate swales and strips, to facilitate settling and/or filtering out of pollutants in runoff from material stockpile areas;
- Media filtration such as catch basin filters and sand filters; and
- Oil/water separators and dry adsorbents in stockpile areas that are potential sources of residual petroleum-based fluids.

(ii) *Scrap and waste material stockpiles (indoors)*—The plan will address, at a minimum, measures and controls to minimize and, whenever feasible, eliminate residual liquids and particulate matter from materials stored indoors from coming in contact with surface runoff. This will include good housekeeping measures to collect residual liquids from aluminum, glass and plastic containers and prohibiting the practice of washing down tipping floors or other material processing areas. Material stockpile areas with existing floor drains will be inspected to ensure that they are no longer connected to the storm sewer system or storm drain conveyance. Any floor drains connected to the storm drainage system will be plugged or sealed.

(iii) *Scrap processing equipment*—The plan will address areas where scrap and waste processing equipment are sited. This includes measures and controls to minimize surface runoff from coming in contact with scrap processing equipment. The plan will specifically address measures to prevent the release of liquids, e.g., hydraulic fluids, fuel, oils, lubricants and accumulated particulate matter. At a minimum, this will include provisions to conduct periodic inspections and preventive maintenance of equipment for leaks, spills, malfunctioning, worn or corroded parts or equipment. In the case of processing equipment that generate visible amounts of particulate residue, e.g., shredding facilities, the plan will describe measures to minimize contact of runoff with residual fluids and particulate matter. In the case of shredded material, the plan shall

address measures to minimize fluff material from coming in contact with storm water runoff or precipitation. The plan should consider the use of containment bins or other suitable containers to collect shredded material exiting the shredder facility. At a minimum, the plan shall include the following:

- A schedule of periodic inspections of equipment for leaks, spills, malfunctioning, worn or corroded parts or equipment;
- Preventive maintenance program to repair and/or maintain processing equipment according to manufacturer's recommendations;
- Measures to minimize the exposure of precipitation or runoff to processed materials, e.g., shredded scrap, fluff;
- High level alarms or other equivalent protection devices on unattended hydraulic reservoirs over 150 gallons in capacity;
- In addition to the requirements identified above, the plan shall consider the use of one or a combination of the following BMPs or other equivalent practice (note: the permittee may identify BMPs that mutually satisfy requirements for this paragraph and this section that address other sources of pollutants, e.g., outdoor material stockpiles): diversion structures such as dikes, berms, culverts, containment trenches, elevated concrete pads, grading to minimize contact of storm water runoff with outdoor processing equipment; oil/water separators, sumps, or dry adsorbents in processing areas that are potential sources of residual petroleum-based compounds and grease; permanent or semipermanent covers, or other similar measures; retention and detention basins, ponds, sediment traps or vegetated swales and strips, to facilitate settling or filtering out of pollutants in runoff from scrap and recyclable waste processing areas; and/or media filtration such as catch basin filters and sand filters.

(iv) *Scrap lead-acid battery program*—The plan will address measures and controls for the proper receipt, handling, storage and disposition of scrap lead-acid batteries. This includes procedures for accepting scrap batteries and how they will be segregated from other scrap materials. The plan will specifically address procedures for managing battery casings that may be cracked or leaking, including the proper handling and disposal of residual fluids. The plan will identify measures to minimize and, whenever possible, eliminate exposure of scrap batteries to either runoff or precipitation. The plan should also address the schedule for conducting periodic inspections of

scrap battery storage areas and applicable source control measures. The plan will describe measures to provide employee training on the management of scrap batteries.

(v) *Erosion and sediment control*—The plan must identify all areas associated with industrial activity that have a high potential for soil erosion. Appropriate stabilization measures, nonstructural and structural controls must be provided in these areas. The plan must also contain a narrative consideration of the appropriateness for selected erosion and sediment controls. In addition, the plan shall identify nonstructural and structural controls necessary to address suspended loadings from those areas that tend to experience a buildup of visible amounts of particulate matter. At a minimum, the plan will include at least one of the following measures:

- Filtering or diversion practices, such as filter fabric fence, sediment filter boom, earthen or gravel berms, curbing or other equivalent measure, placed around exposed significant materials, scrap processing equipment and inlets or catch basins;
- Catch basin filters, filter fabric fence, or equivalent measure, place in or around inlets or catch basins that receive runoff from scrap and waste storage areas, and processing equipment;
- Sediment traps, vegetative buffer strips, or equivalent, that effectively trap or remove sediment prior to discharge through an inlet or catch basin.

In instances where significant erosion and suspended solids loadings continue after installation of nonstructural controls, the plan shall provide a detention or retention basin or other equivalent structural control. All structural controls shall be designed using good engineering practice. All structural controls and outlets that are likely to receive discharges containing oil and grease must include appropriate measures to minimize the discharge of oil and grease through the outlet riser. This may include the use of an absorbent boom.

(vi) *Spill prevention and response procedures*—Spills are most likely to occur during processing or loading and unloading of materials. For this reason, it is important that facilities establish standard safe practices for these operations. Common causes of spills or leaks include container failures, equipment leaks, and materials handling. Frequent inspections of storage areas and equipment will reduce the likelihood that faulty containers and equipment will go unnoticed. Employee education and training described below

should also reduce the chance of spills occurring. The plan shall include the following practices:

- The plan shall describe spill prevention and response measures to address areas that are potential sources of leaks or spills of fluids;
 - All visible leaks and spills shall be contained and cleaned up as soon as possible. If malfunctioning equipment is responsible for the spill or leak, repairs shall also be conducted as soon as possible;
 - Cleanup procedures shall be identified in the plan, including the use of dry absorbent materials. The plan shall provide that an adequate supply of dry absorbent material shall be maintained onsite, and used absorbent material shall be cleaned up and disposed of properly;
 - Drums containing liquids, including oil and lubricants, shall be stored indoors; or in a bermed area; or in overpack containers or spill pallets; or in similar containment devices;
 - Overfill prevention devices shall be installed on all fuel pumps and tanks;
 - Drip pans or equivalent measures shall be placed under any leaking piece of stationary equipment until the leak is repaired. The drip pans must be inspected for leaks and checked for potential overflow. They will be emptied regularly to prevent overflow and all liquids will be disposed of in accordance with all requirements under RCRA.
 - An alarm and/or pump shut off system shall be installed and maintained on all outside equipment with hydraulic reservoirs exceeding 150 gallons in order to prevent draining the tank contents if a line breaks, provided all parts of the hydraulic system are not visible to the operator of the processing equipment. As an alternative, such equipment may have a secondary containment system capable of containing the contents of the hydraulic reservoir plus adequate freeboard for precipitation.
- (vii) *Monthly inspection program*—The monthly inspection will include all designated areas of the facility and equipment identified in the plan. The inspection will include a means of tracking and conducting follow up actions based on the results of the inspection. The inspections will be conducted by members of the Storm Water Pollution Prevention team. At a minimum, the visual inspection shall include the following areas:
- All outdoor scrap processing areas;
 - All material unloading and loading areas (including rail sidings) that are exposed to either precipitation or storm water runoff;

- Areas where structural BMPs have been installed;
- All erosion and sediment BMPs;
- Outdoor vehicle and equipment maintenance areas;
- Vehicle and equipment fueling areas; and
- All areas where waste is generated, received, stored, treated, or disposed and which are exposed to either precipitation or storm water runoff.

If exposed to precipitation or storm water runoff, the inspection will identify corroded or leaking containers, corroded or leaking pipes, leaking or improperly closed valves and valve fittings, leaking pumps and/or hose connections, and deterioration in diversionary or containment structures. Any spills or leaks will be immediately addressed according to the facilities. A record of inspections will be maintained with the plan.

The BMPs identified above have been employed by scrap and waste recycling facilities and are believed to be appropriate given the types of pollutants found in storm water discharges from these facilities. In addition, the diversity of options allows permittees to select those BMPs that are most applicable to the extent of the risk that exists at a particular facility. In instances where nonstructural measures are not sufficient, the conditions direct the permittee to more stringent requirements such as structural controls.

(b) *Waste recycling facilities (recyclable liquid wastes)*—In addition to the baseline requirements for plans, all permittees seeking coverage under Part XI.N. of today's proposed permit must specifically address the following areas within their plan.

(i) *Waste material storage (indoors)*—The plan will address measures and controls to minimize residual liquids from waste materials stored indoors from coming in contact with surface runoff. The plan must also include a sufficient supply of dry-absorbent materials or a wet vacuum system or other equivalent measure to promptly respond to minor leaks or spills. This includes measures for secondary containment or its equivalent, procedures for proper material handling (including labeling and marking) and storage of containerized materials. Drainage from bermed areas shall be discharged to an appropriate treatment facility or sanitary sewer system. Discharges from bermed areas shall be covered by a separate NPDES permit or industrial user permit under the pretreatment program. The drainage system, where applicable, should include appropriate appurtenances such

as pumps or ejectors and manually-operated valves of the open-and-close design.

(ii) *Waste material storage (outdoors)*—The plan will address areas where significant materials are exposed to either storm water runoff or precipitation. The plan must include measures to provide appropriate containment, drainage control and/or other appropriate diversionary structures. The plan must describe those measures and controls used to minimize contact of storm water runoff with stored materials. The plan shall also include the following preventative measures or its equivalent:

- An appropriate containment structure such as dikes, berms, curbing or pits, or other equivalent measure;
- The containment shall be sufficient to store the volume of the largest single tank and shall include sufficient freeboard for precipitation; and
- A sufficient supply of dry-absorbent materials or a wet vacuum system, or other equivalent measure, to collect liquids from minor spills and leaks in contained areas.

(iii) *Truck and rail car waste transfer areas*—The plan will describe measures and controls for truck and rail car loading and unloading areas. This includes appropriate containment and diversionary structures to minimize contact with precipitation and/or storm water runoff. The plan will also address measures to clean up minor spills and/or leaks originating from the transfer of liquid wastes. This may include dry-clean up methods, roof coverings, and other runoff controls.

(iv) *Spill prevention and response procedures*—The plan will address measures and procedures to address potential spill scenarios that could occur at the facility. This includes all applicable handling and storage procedures, containment, diversion controls and clean-up procedures. The plan will specifically address all outdoor and indoor storage areas, waste transfer areas, material receiving areas (loading and unloading), and waste disposal areas.

(v) *Monthly site inspections*—The facility will conduct monthly visual inspections by a member or members of the storm water pollution prevention team. The monthly inspection will include all designated areas of the facility and equipment identified in the plan. The inspection will include a means of tracking and conducting follow up actions based on the results of the inspection. At a minimum, the monthly site inspection shall include the following areas:

- Material storage areas;

• Material unloading and loading areas (including rail sidings) that are exposed to either precipitation or storm water runoff;

• Areas where structural BMPs have been installed;

• All erosion and sediment BMPs;

• Outdoor vehicle and equipment maintenance areas (if applicable);

• Vehicle and equipment fueling areas (if applicable); and

• All areas where waste is generated, received, stored, treated, or disposed and which are exposed to either precipitation or storm water runoff.

If exposed to precipitation or storm water runoff, the inspection will identify corroded or leaking containers, corroded or leaking pipes, leaking or improperly closed valves and valve fittings, leaking pumps and/or hose connections, and deterioration in diversionary or containment structures. Any spills or leaks will be immediately addressed according to the facility's spill prevention and response procedures.

6. Monitoring and Reporting Requirements

a. *Analytical monitoring requirements.* EPA believes that scrap and waste material processing and recycling facilities may reduce the level of pollutants in storm water runoff from their sites through the development and proper implementation of the storm water pollution prevention plan requirements discussed in today's proposed permit. In order to provide a tool for evaluating the effectiveness of the pollution prevention plan and to characterize the discharge for potential environmental impacts, the proposed permit requires scrap and waste material processing and recycling facilities to collect and analyze samples of their storm water discharges for the pollutants listed in Table N-13. The pollutants listed in Table N-13 were found to be above benchmark levels for a significant portion of scrap and waste material processing and recycling facilities that submitted quantitative data in the group application process, or

are believed to be present based upon the description of industrial activities and significant materials exposed. Because these pollutants have been reported at benchmark levels from scrap and waste material processing and recycling facilities, EPA is requiring monitoring after the pollution prevention plan has been implemented to assess the effectiveness of the pollution prevention plan and to help ensure that a reduction of pollutants is realized.

At a minimum, storm water discharges from scrap and waste material processing and recycling facilities must be monitored quarterly during the second year of permit coverage. At the end of the second year of permit coverage, a facility must calculate the average concentration for each parameter listed in Table N-13. If the permittee collects more than four samples in this period, then they must calculate an average concentration for each pollutant of concern for all samples analyzed.

TABLE N-13.—INDUSTRY MONITORING REQUIREMENTS

| Pollutants of concern | Cut-off concentration (mg/L) |
|-------------------------------------|------------------------------|
| Chemical Oxygen Demand (COD) | 65.0 |
| Total Kjeldahl Nitrogen (TKN) | 1.5 |
| Total Recoverable Aluminum | 0.75 |
| Total Recoverable Cadmium | 0.0018 |
| Total Recoverable Copper | 0.009 |
| Total Recoverable Iron | 0.3 |
| Total Recoverable Lead | 0.0337 |
| PCBs | 0.00000044 |
| Total Recoverable Zinc | 0.065 |
| Nitrate + Nitrite Nitrogen | 0.68 |
| Total Recoverable Arsenic | 0.000018 |

If the average concentration for a parameter is less than or equal to the value listed in Table N-13, then the permittee is not required to conduct quantitative analysis for that parameter during the fourth year of the permit. If, however, the average concentration for a parameter is greater than the cut-off concentration listed in Table N-13, then the permittee is required to conduct quarterly monitoring for that parameter during the fourth year of permit coverage. Monitoring is not required during the first, third, and fifth year of the permit. The exclusion from monitoring in the fourth year of the permit is conditional on the facility maintaining industrial operations and BMPs that will ensure a quality of storm water discharges consistent with the average concentrations recorded during the second year of the permit.

TABLE N-14.—SCHEDULE OF MONITORING

| | |
|------------------------------|--|
| 2nd year of permit coverage. | <ul style="list-style-type: none"> • Conduct quarterly monitoring. • Calculate the average concentration for all parameters analyzed during this period. • If average concentration is greater than the value listed in Table N-13, then quarterly sampling is required during the fourth year of the permit. • If average concentration is less than or equal to the value listed in Table N-13, then no further sampling is required for that parameter. |
| 4th year of permit coverage. | <ul style="list-style-type: none"> • Conduct quarterly monitoring for any parameter where the average concentration in year 2 of the permit is greater than the value listed in Table N-13. • If industrial activities or the pollution prevention plan have been altered such that storm water discharges may be adversely affected, quarterly monitoring is required for all parameters of concern. |

In cases where the average concentration of a parameter exceeds the cut-off concentration, EPA expects permittees to place special emphasis on methods for reducing the presence of those parameters in storm water discharges. Quarterly monitoring in the fourth year of the permit will reassess the effectiveness of the adjusted pollution prevention plan.

b. Alternative certification. Throughout today's permit, EPA has

proposed monitoring requirements for facilities which the Agency believes have the potential for contributing significant levels of pollutants to storm water discharges. The alternative described below is necessary to ensure that monitoring requirements are only imposed on those facilities that do, in fact, have storm water discharges containing pollutants at concentrations of concern. EPA has determined that if materials and activities are not exposed to storm water at the site, then the potential for pollutants to contaminate storm water discharges does not warrant monitoring.

Therefore, a discharger is not subject to the monitoring requirements of this Part provided the discharger makes a certification for a given outfall, on an annual basis, under penalty of law, signed in accordance with Part VII.G. (Signatory Requirements), that material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, industrial machinery or operations, significant materials from past industrial activity, or, in the case of airports, deicing activities, that are located in areas of the facility that are within the drainage area of the outfall are not presently exposed to storm water and will not be exposed to storm water for the certification period. Such certification must be retained in the storm water pollution prevention plan and submitted to EPA in accordance with Part VI.C. of this permit.

c. Reporting requirements. Permittees are required to submit all monitoring results obtained during the second and fourth year of permit coverage within 3 months of the conclusion of each year. Such permittees must submit monitoring results on four separately signed Discharge Monitoring Report Forms to the Director. For facilities conducting monitoring beyond the minimum quarterly requirements an additional Discharge Monitoring Report Form must be filed for each analysis.

d. Sample type. All discharge data shall be reported for grab samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inch in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during

the first 30 minutes was impracticable. If storm water discharges associated with industrial activity commingle with process or nonprocess water, then where practicable permittees must attempt to sample the storm water discharge before it mixes with the non-storm water discharge.

EPA requests comments upon a condition of today's proposed permit that would require permittees who are unable to sample storm water discharges before they commingle with non-storm water discharges to sample the combined discharge both during dry and wet weather and submit both sets of data to the permitting authority.

e. Representative discharge. When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may test the effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluent. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

f. Monthly visual examination of storm water quality. Monthly visual inspections of storm water discharges from each outfall are required. The inspection must be of a grab sample collected from each storm water outfall. The examination of storm water grab samples shall include any observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, or other obvious indicators of storm water pollution. The inspection must be conducted in a well lit area. No analytical tests are required to be performed on these samples.

The examination must be made at least once in each month of the permit during daylight unless there is insufficient rainfall or snow-melt to runoff. EPA expects that, whenever practicable, the same individual should carry out the collection and examination of discharges throughout the life of the permit to ensure the greatest degree of consistency possible. Grab samples shall

be collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 60 minutes) of when the runoff begins discharging. Reports of the visual observation include: The examination date and time, examination personnel, visual quality of the storm water discharge, and probable sources of any observed storm water contamination. The visual observation reports must be maintained onsite with the pollution prevention plan.

EPA believes that this quick and simple assessment will allow the permittee to approximate the effectiveness of his/her plan on a regular basis at very little cost. Although the visual examination cannot assess the chemical properties of the storm water discharged from the site, the examination will provide meaningful results upon which the facility may act quickly. The frequency of this visual inspection will also allow for timely adjustments to be made to the plan. If BMPs are performing ineffectively, corrective action must be implemented. A set of tracking or follow-up procedures must be used to ensure that appropriate actions are taken in response to the inspections. The visual examination is intended to be performed by members of the pollution prevention team. This hands-on inspection will enhance the staff's understanding of the storm water problems on that site and effects on the management practices that are included in the plan.

When a discharger is unable to collect samples over the course of the monitoring period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

g. Baseline general permit variance. On September 9, 1992, and September 25, 1992, EPA published the Final NPDES General Permits for Storm Water Discharges Associated With Industrial Activity. These notices set out requirements for semiannual monitoring for several parameters for discharges from areas for storage of lead acid batteries, reclamation products, or waste products, and areas used for lead acid battery reclamation. These notices specifically require that facilities with storm water discharges that are associated with areas for storage of lead

acid batteries, reclamation products, or waste products, and areas used for lead acid battery reclamation are required to monitor their storm water discharges for oil and grease, COD, total suspended solids, pH, total recoverable copper, and total recoverable lead. Today's proposed permit contains increased monitoring requirements for battery reclaimers. EPA requests comment upon the difference between the monitoring requirements set out for battery reclaimers in the September 1992 General Permits and those required in today's proposed permit.

7. Alternative Monitoring Requirements

EPA requests comment upon the following monitoring and reporting requirements in lieu of those proposed in Part XI.N.5. of today's proposed permit.

a. Monitoring requirements for scrap and waste recycling facilities (non-liquid recyclable wastes). During the period beginning on the effective date and lasting through the expiration date of this permit, permittees with storm water discharges from scrap and waste recycling facilities that are primarily engaged in the processing, reclaiming and wholesale distribution of nonliquid recyclable materials, but limited to those activities classified SIC 5093, shall monitor for TSS, oil and grease, pH, and semiannual acute Whole Effluent Toxicity (WET) beginning no later than 3 years from date of permit issuance except as provided below in paragraphs XI.N.7.b. (Sampling Waiver), XI.N.7.c. (Representative Discharge), and XI.N.7.d. (Alternative Certification). Permittees identified in this part must report in accordance with Part VI.B. (Reporting: Where to Submit) and paragraph XI.N.7.f. (Reporting: When to Submit).

In addition to the parameters listed below, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event which generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

b. Sampling waiver. When a discharger is unable to collect samples due to adverse climatic conditions, the discharger must submit in lieu of sampling data a description of why samples could not be collected, including available documentation of the event. Adverse weather conditions which may prohibit the collection of samples include weather conditions that

create dangerous conditions for personnel (such as local flooding, high winds, hurricanes, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.). Dischargers are precluded from exercising this waiver more than once during a 2-year period.

c. Representative discharge. When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may test the effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfalls provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explaining in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area (e.g., low (under 40 percent), medium (40 to 65 percent) or high (above 65 percent)) shall be provided in the plan. Permittees required to submit monitoring information under Parts XI.N.6. a. or c. of this permit shall include the description of the location of the outfalls, explanation of why outfalls are expected to discharge substantially identical effluents, and estimate of the size of the drainage area and runoff coefficient with the Discharge Monitoring Report (DMR).

d. Alternative certification. A discharger is not subject to the monitoring requirements of Part XI.N. of this permit for a given outfall provided the discharger makes a certification, on an annual basis for discharges identified under Part XI.N.1., under penalty of law, signed in accordance with Part VII.G. (Signatory Requirements), that material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, industrial machinery or operations, significant materials from past industrial activity, that are located in areas of the facility that are within the drainage area of the outfall are not presently exposed to storm water and was not exposed to storm water for the certification period. Such certification must be retained in the storm water pollution prevention plan, and submitted to the U.S.

Environmental Protection Agency (EPA) in accordance with Part VI.C. of this permit.

e. Toxicity testing. Permittees and new discharges that are required to monitor for acute whole effluent toxicity shall initiate the series of tests described below no later than 3 years from permit issuance.

(1) The permittee shall conduct acute 24-hour static toxicity tests on both an appropriate invertebrate and an appropriate fish (vertebrate) test species (EPA/600/4-90-027 Rev 9/91), Section 6.1). Freshwater species must be used for discharges to freshwater waterbodies. Due to the nonsaline nature of rainwater, freshwater test species should also be used for discharges to estuarine, marine or other naturally saline waterbodies.

(2) All test organism, procedures and quality assurance criteria used shall be in accordance with "Methods for Measuring the Acute Toxicity of

Effluents and Receiving Waters to Freshwater Marine Organisms," EPA/600/4-90-027 (Rev. September 1991). EPA has proposed to establish regulations regarding these test methods (December 4, 1989, 53 FR 50216).

(3) Tests shall be conducted semiannually on a grab sample of the discharge. Tests shall be conducted using 100 percent effluent (no dilution) and a control consisting of synthetic dilution water. Results of all tests conducted with any species shall be reported according to EPA/600/4-90-027 (Rev. September 1991), Section 12, Report Preparation, and the report submitted to EPA with the DMRs. On the DMR, the permittee shall report "0" if there is no statistical difference between the control mortality and the effluent mortality for each dilution. If there is statistical difference (exhibits toxicity), the permittee shall report "1" on the DMR.

(4) If acute whole effluent toxicity (statistically significant difference between the 100 percent dilution and the control) is detected, the permittee shall review the storm water pollution prevention plan and make appropriate modifications to assist in identifying the source(s) of toxicity and to reduce the toxicity of their storm water discharges. The permittee shall continue to conduct semiannual whole effluent toxicity testing until such time that acute whole effluent toxicity is no longer detected.

(5) *Type of sample.* The grab sample shall be collected in the first 30 minutes of the discharge or as soon thereafter as practical, but not to exceed 60 minutes. Sampling locations shall be limited to those outfalls servicing portions of the facility engaged in industrial activity.

(6) Table N-1 summarizes sampling parameters, type and frequency information for permittees required to monitor under this part of the permit:

TABLE N-1

| Parameter | Unit | Frequency ¹ | Sample type |
|-------------------------------------|------------------|------------------------|-------------|
| pH | std. units | 2/permit term | Grab. |
| TSS | mg/L | 2/permit term | Grab. |
| Oil and Grease | mg/L | 2/permit term | Grab. |
| Acute whole effluent toxicity | N/A | 2/permit term | Grab. |

¹ Monitoring requirements for all parameters listed in Table N-1 shall begin no later than 3 years from the date of issuance of the final permit. Monitoring for, pH, oil and grease, and TSS shall continue on a semiannual basis for the remainder of the permit term.

(7) *Visual monitoring requirements.* All scrap and waste recycling facilities (nonliquid recyclable wastes) shall be required to conduct semiannual visual inspections of their discharges for sediment, oil and grease, and other visible signs of contamination. The facility shall establish a record of visual observations that shall be kept with the pollution prevention plan. In the event a facility observes a discharge with oil and grease or other reportable hazardous substance in excess of a reportable quantity (see 40 CFR part 110, 40 CFR part 117, or 40 CFR part 302), the facility shall document preventative and corrective actions taken to minimize the potential for recurrence. This permit does not relieve permittees of the reporting requirements of 40 CFR part 117 and 40 CFR part 302.

f. Reporting: when to submit.

(1) Permittees that are required to conduct sampling under this part of the permit shall submit monitoring results obtained during the reporting period on DMR Form(s) postmarked no later than the 30 days after the completion of the sampling event.

g. Retention of records. (1) The permittee shall retain records of all inspections and monitoring information, including certification reports, noncompliance reports, calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of all reports, and supporting data, requested by the permitting authority for at least 3 years after the date that the permit expires.

h. Waste recycling facilities (liquid recyclable wastes) reporting under section 313 of SARA Title III. (1) Facilities reporting under Section 313 of SARA Title III must monitor their storm water discharges according to the requirements listed at Part VI.A.

O. Storm Water Discharges Associated With Industrial Activity From Steam Electric Power Generating Facilities, Including Coal Handling Areas

The conditions proposed in this section apply to storm water discharges from steam electric power generating facilities. The steam electric power generating category includes facilities which are coal, oil, gas, or nuclear fired.

Heat captured co-generation facilities are not covered under the definition of storm water discharge associated with industrial activity, however, dual fuel co-generation facilities are included in the definition. When an industrial facility, described by the above eligibility provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

If monitoring and pollution prevention plan requirements of another industrial activity section of this permit

apply to co-located industrial activities at an industrial facility, the eligibility provisions of that industrial activity section shall not preclude the operator of the industrial facility from complying with the applicable monitoring and pollution prevention plan requirements of that section.

Storm water discharges from coal piles are eligible for coverage under this permit, where these discharges are not already subject to an existing NPDES permit.

1. Industrial Profile

The production of electrical energy always involves the conversion of some other form of energy. The two most important sources of energy which are converted to steam electric energy are the chemical energy of fossil fuels and the atomic energy of nuclear fuels. Current uses of fossil fuels are based on a combustion process, followed by steam generation to convert the heat first into mechanical energy and then to convert the mechanical energy into electrical energy. Nuclear power plants utilize a cycle similar to that used in fossil fueled power plants except that the source of heat is atomic interactions rather than the combustion of fossil fuel.

The steam electric power generating process for fossil fuel systems are typically enclosed and subject to effluent limitations guidelines [40 Code of Federal Regulations (CFR) part 423], as is coal pile runoff. However, the unloading and transport of coal within the facility is subject to the conditions set forth in this section of today's proposed permit. Likewise, the unloading and storage areas for liquid fuels and chemicals are subject to the conditions in this section of today's proposed permit. Fossil fuel combustion waste disposal areas are subject to storm water regulations but are discussed in the landfill and industrial waste disposal sector of today's proposed permit.

Industrial activities occurring at steam electric power generating facilities that pertain to the storm water rule include, " * * * but [are] not limited to, storm water discharges from industrial plant yards; material handling sites; refuse sites; sites used for the application or disposal of process wastewaters (as defined at 40 CFR part 401); sites used for the storage and maintenance of material handling equipment; sites used for residual treatment, storage, or disposal; shipping and receiving areas; manufacturing buildings; storage areas (including tank farms) for raw materials and intermediate and finished materials; and areas where industrial activity has taken place in the past and significant

materials remain and are exposed to storm water" (40 CFR 122.26(b)(14)). Common industrial activities at steam electric power generating facilities include the unloading, transport, and storage of raw materials, and the disposal of waste materials.

Significant materials include, " * * * but [are] not limited to: raw materials; fuels; materials such as solvents, detergents, and plastic pellets; finished materials such as metallic products; * * * hazardous substances designated under Section 101(14) of CERCLA; any chemical facilities required to report pursuant to section 313 of title III of SARA; fertilizers; pesticides; and waste products such as ashes, slag, and sludge that have the potential to be released with storm water discharges" (40 CFR 122.26(b)(12)). Significant materials commonly found at steam electric power generating facilities include: coal; diesel fuel; and waste materials.

Historically, steam electric power generating facilities were categorized in accordance with the type of fuel they burned. Recently, however, steam electric power generating facilities have modified their equipment to enable them to use more than one fuel. Presented below are brief descriptions of the industrial activities and significant materials associated with the production of steam electric power. Due to the increase in facilities burning multiple fuels the industrial activities and significant materials are discussed together. However, the industrial activities and significant materials for nuclear powered facilities are discussed separately. Unique practices are noted.

a. Industrial activities: fossil fuel powered plants. Steam electric power generation can be divided into four stages. In the first operation, fossil fuel (coal, oil, or natural gas) is burned in a boiler furnace. The evolving heat is used to produce pressurized and superheated steam. This steam is conveyed to the second stage, the turbine, where it gives energy to the rotating blades and, in the process, loses pressure and increases in volume. The rotating blades of the turbine act to drive an electric generator or alternator to convert the imparted mechanical energy into electrical energy. The steam leaving the turbine enters the third state, the condenser, where it is condensed to water. The liberated heat is transferred to a cooling medium which is normally water. Finally, the condensed steam is reintroduced into the boiler by a pump to complete the cycle.

Features unique to coal-fired plants include coal storage and preparation (transport, beneficiation, pulverization, drying), coal-fired boiler, ash handling

and disposal systems, and flue gas cleaning, and desulfurization.

b. Significant materials: fossil fuel powered plants. The type of fuel (coal, oil, gas, nuclear) used to fire power plant boilers most directly influences the number of waste streams. The influence comes principally from the effect of fuel on the volume of ash generated. Stations using heavy or residual oils generate fly ash in large quantities and may generate some bottom ash. Stations which burn coal create both fly ash and bottom ash. Bottom ash is the residue which accumulates on the furnace bottom, and fly ash is the lighter material which is carried over in the flue gas stream.

c. Industrial activities: nuclear powered plants. Nuclear power plants utilize a cycle similar to that used in fossil fueled power plants except that the source of heat is atomic interactions rather than the combustion of fossil fuel. Water serves as both moderator and coolant as it passes through the nuclear reactor core. In a pressurized water reactor, the heated water then passes through a separate heat exchanger where steam is produced on the secondary side. This steam, which contains radioactive materials, drives the turbines. In a boiling water reactor, steam is generated directly in the reactor core and is then piped directly to the turbine. This arrangement produces some radioactivity in the steam and therefore requires some shielding of the turbine and condenser.

d. Significant materials: nuclear powered plants. Few if any significant materials are exposed to storm water at nuclear powered steam electric facilities. Materials that are potentially exposed do not involve steam electric generating equipment, raw materials, or waste products. The materials that are exposed to storm water are office wastes and ground maintenance equipment and tools.

2. Pollutants in Storm Water Discharges Associated With Steam Electric Power Generating Facilities

Steam electric generating facilities are subject to effluent limitations guidelines that limit the number and variety of industrial activities that are included in the storm water program. Pollutants may be present in storm water as a result of outdoor activities associated with steam electric power generating facilities such as: material handling and transport operations; waste disposal; and deposition of airborne particulate matter. In addition, sources of pollutants other than storm water, such

as illicit connections,¹¹⁵ spills, and other improperly dumped materials, may increase the pollutant loadings discharged into waters of the United States.

Many of the part 2 group application data submittals did not identify

individual site characteristics or sources of storm water pollutants which may be responsible for pollutant loadings. In addition, because the industry has been moving toward combined fuel generating facilities, the part 2 sampling data was reviewed in the aggregate.

Table O-1 lists potential pollutant source activities and related pollutants associated with steam electric power generating facilities. The primary and largest potential source of storm water pollutants from fossil-fueled steam electric generating facilities is ash refuse piles.

TABLE O-1.—INDUSTRIAL ACTIVITIES, POLLUTANT SOURCES, AND POLLUTANTS FOR STEAM ELECTRIC POWER GENERATING FACILITIES

| Activity | Pollutant source | Pollutant |
|--|--|--|
| Above ground liquid storage tank .. | External corrosion and structural failure | Fuel, oil, heavy metals, ammonia, chlorine, sulfuric acid, sodium hydroxide, and other materials being stored. |
| | Installation problems | Fuel, oil, heavy metals, ammonia, chlorine, sulfuric acid, sodium hydroxide, and other materials being stored. |
| | Spills due to operator error | Fuel, oil, heavy metals, ammonia, chlorine, sulfuric acid, sodium hydroxide, and other materials being stored. |
| | Failure of piping systems | Fuel, oil, heavy metals, ammonia, chlorine, sulfuric acid, sodium hydroxide, and other materials being stored. |
| | Leaks or ^a spills during pumping of liquids from barges, trucks, rail cars to a storage facility. | Fuel, oil, heavy metals, ammonia, chlorine, sulfuric acid, sodium hydroxide, and other materials being stored. |
| Vehicle and equipment maintenance. | Parts cleaning | Oil, heavy metals, chlorinated solvents, acid/alkaline wastes, ethylene glycol. |
| | Spills of oil, degreasers, hydraulic fluids, transmission fluid, radiator fluids. | Oil, arsenic, heavy metals, organics, chlorinated solvents, ethylene glycol. |
| Fueling operations | Fluids replacement | Oil, arsenic, heavy metals, organics, fuel. |
| | Spills & leaks during fuel delivery | Fuel, oil, heavy metals. |
| | Spills caused by "topping off" fuel tanks | Fuel, oil, heavy metal. |
| | Leaking storage tanks | Fuel, oil, heavy metals. |
| | Allowing rainfall on the fuel area or storm water to run onto the fuel area. | Fuel, oil, heavy metals. |
| Coal handling areas | Fugitive dust emissions from coal handling | Suspended solids, copper, iron, aluminum, nickel, and trace metals. |
| | Spills during delivery | Suspended solids, copper, iron, aluminum, nickel, and trace metals. |
| | Offsite tracking of coal dust | Suspended solids, copper, iron, aluminum, nickel, and trace metals. |
| Ash handling areas, ash landfills | Spills during transfer of ash to landfills | Suspended solids, chromium, copper, iron, zinc, oil and grease, aluminum. |
| | Offsite tracking of ash | Suspended solids, chromium, copper, iron, zinc, oil and grease, aluminum. |
| Scrapyards, refuse sites | Discarded material | Fuel, oils, heavy metals. |

The ash composition from oil, on a weight percent basis, is much lower than that of coal. Oil ash rarely exceeds 0.3 percent of the input oil whereas coal ash comprises from 3 to 30 percent of the coal. In general, the ash content increases with increasing asphaltic constituents in which the sulfur acts largely as a bridge between aromatic rings.

The many elements which may appear in oil ash deposits include vanadium, sodium, and sulfur. Compounds containing these elements are found in almost every deposit in boilers fired by residual fuel oil and

often constitute the major portion of these deposits. Oil ash, especially from plants using Venezuelan and certain Middle Eastern oil can contain significant amounts of nickel.

Some of the ash-forming constituents in the crude oil had their origin in animal and vegetable matter from which the oil was derived. The remainder is extraneous material resulting from contact of the crude oil with rock structures and salt brines or picked up during refining processes, storage, and transportation. Vanadium, iron, sodium, nickel, and calcium in fuel oil are common in rock strata, but elements

including vanadium, nickel, zinc, and copper are believed to come from organic matter from which the petroleum was created.

The ash residue resulting from the combustion of coal is primarily derived from the inorganic matter in the coal. The chemical composition of dry bottom ash and fly ash are quite similar. The major constituents present in coal ash are silica, alumina, ferric oxide, calcium oxide, magnesium oxide, and minor amounts of sodium and potassium oxides. Other parameters which may be present include sulfur trioxide, carbon, boron, phosphorus,

¹¹⁵ Illicit connections are contributions of unpermitted non-storm water discharges to storm sewers from any of a number of sources including

sanitary sewers, industrial facilities, commercial establishments, or residential dwellings. The probability of illicit connections at steam electric

facilities is low yet it still may be applicable at some operations.

uranium, and thorium. The concentration differences can vary considerably from one site to another.¹¹⁶

When conducting their data analysis for their 1980 Development Document, the U.S. Environmental Protection Agency (EPA) found that there was no correlation between arsenic, nickel, zinc, copper, and selenium and total suspended solids, whenever their value was 30 mg/L or less.¹¹⁷

The quality of storm water runoff from coal handling areas is dependent on pH, as pH influences the release of toxic and heavy metals. Suspended solids levels result when storm water suspends coal particulates. Most of the

total dissolved solids concentrations are a consequence of enhanced pyritic oxidation.

Storm water runoff from exposed sources of coal tends to be of an acid nature, primarily as a result of the oxidation of iron sulfide in the presence of oxygen and water.¹¹⁸ The presence of certain acidophilic, chemoautotrophic bacteria, and a pH of 2.0 to 4.5 generally indicates storm water runoff high in iron, manganese, and total dissolved solids.¹¹⁹

Table O-2 and Table O-3 indicates the sampling data results from the part 2 group application submissions. This table indicates the minimum and

maximum values, means, medians, 95th percentiles, 99th percentiles, and the total number of outfalls sampled for each of the pollutants. Variations in the minimum and maximum values were found to be small, relative to other industrial sectors in today's proposed permit for the eight conventional pollutants. The range in values, means, and medians for the conventional pollutants sampled were typically low, except for mean total suspended solids. Less than 50 percent of the sampling facilities have submitted sampling data for part 2 of the application.

TABLE O-2.—STATISTICS FOR CONVENTIONAL POLLUTANTS IN STORM WATER,¹ (mg/L, Except as Noted)

| Pollutant | Number of samples | | Mean | | Minimum | | Maximum | | Median | | 95th percentile | | 99th percentile | |
|--------------------------|-------------------|-----|-------|-------|---------|------|---------|--------|--------|------|-----------------|-------|-----------------|--------|
| | | | Grab | Comp | Grab | Comp | Grab | Comp | Grab | Comp | Grab | Comp | Grab | Comp |
| BOD ₅ | 76 | 78 | 5.7 | 5.7 | 0.0 | 0.0 | 45.0 | 37.0 | 4.3 | 4.0 | 20.0 | 20.0 | 45.0 | 37.0 |
| COD | 76 | 77 | 104.0 | 69.5 | 0.0 | 0.0 | 1410.0 | 540.0 | 32.5 | 39.5 | 360.0 | 280.0 | 1410.0 | 540.0 |
| Nitrate+nitrite nitrogen | 76 | 77 | 5.6 | 0.8 | 0.0 | 0.0 | 350.0 | 3.9 | 0.4 | 0.5 | 3.7 | 3.2 | 350.0 | 3.9 |
| Total Kjeldahl nitrogen | 76 | 78 | 2.4 | 1.9 | 0.0 | 0.0 | 22.3 | 19.1 | 1.3 | 1.0 | 8.6 | 10.0 | 22.3 | 19.1 |
| Oil & grease | 88 | N/A | 1.4 | N/A | 0.0 | N/A | 20.0 | N/A | 0.0 | N/A | 6.0 | N/A | 20.0 | N/A |
| pH (s.u.) | 70 | N/A | N/A | N/A | 3.8 | N/A | 9.0 | N/A | N/A | N/A | N/A | N/A | N/A | N/A |
| Total phosphorus | 75 | 78 | 0.8 | 0.6 | 0.0 | 0.0 | 6.0 | 7.2 | 0.3 | 0.3 | 3.1 | 3.1 | 6.0 | 7.2 |
| Tot. suspended solids | 76 | 77 | 516.3 | 212.4 | 0.0 | 0.0 | 22790.0 | 5554.0 | 44.0 | 40.0 | 1200.0 | 810.0 | 22790.0 | 5554.0 |

¹ Applications that did not report the units of measurement for the reported values of pollutants were not included in these statistics.

ⁱⁱ Composite samples.

TABLE O-3.—Statistics for Toxic Pollutants in Storm Water,¹ (mg/L, Except as Noted)

| Pollutant | Number of samples | | Mean | | Minimum | | Maximum | | Median | | 99th percentile | |
|-----------|-------------------|----|-------|-------|---------|-------|---------|-------|--------|-------|-----------------|-------|
| | | | Grab | Comp | Grab | Comp | Grab | Comp | Grab | Comp | Grab | Comp |
| Copper | 65 | 71 | 0.083 | 0.029 | 0.00 | 0.00 | 2.62 | .370 | 0.004 | 0.015 | 2.62 | 0.370 |
| Arsenic | 34 | 33 | 0.168 | 0.180 | 0.0 | 0.00 | 5.1 | 5.4 | 0.005 | 0.003 | 5.10 | 5.4 |
| Iron | 65 | 71 | 7.228 | 6.45 | 0.020 | 0.040 | 67.0 | 191 | 1.85 | 1.5 | 67.00 | 191.0 |
| Lead | 20 | 17 | 0.019 | 0.019 | 0.0 | 0.00 | 0.099 | 0.073 | 0.003 | 0.007 | 0.099 | 0.073 |
| Manganese | 6 | 9 | 0.50 | 0.185 | 0.03 | 0.000 | 2.1 | 0.630 | 0.066 | 0.050 | 2.10 | 0.630 |

Below is a discussion of data submitted by group applicants:

• **Chemical Oxygen Demand (COD)**—COD measures the total amount of oxygen necessary for oxidation. COD is an effective indicator of levels of biologically resistant organic substances. Higher COD levels, for example, may be attributed to the presence of biologically resistant organics, such as oil and grease. COD data submitted in the part 2 applications

from steam electric power generating facilities indicate the following:

- The mean concentrations for grab and composite samples were 104.0 mg/L and 69.5 mg/L, respectively.
- The median concentrations for grab and composite samples were 32.5 mg/L and 39.5 mg/L, respectively.
- The 95th percentile concentration (i.e., 95 percent of the values are below) for grab and composite samples were approximately 360 mg/L and 280 mg/L, respectively.

—The 99th percentile concentration (i.e., 99 percent of the values are below) for grab and composite samples were 1,410 mg/L and 540 mg/L, respectively.

These mean and median COD concentrations are within the recommended load estimates for storm water runoff from residential and commercial areas.¹²⁰ However, the maximum COD level exceeds the NURP recommendations for load estimates.

• **Oil and Grease**—There are several sources of oil and grease from steam electric power generating facilities. These sources include unloading/loading areas; vehicle/equipment maintenance and cleaning; and outdoor storage of vehicles, equipment and castings. Oil and grease emulsions are detrimental to aquatic organisms and inhabitants because: (1) Deposition of oil and grease in bottom sediments can serve to inhibit normal benthic growths, impacting the aquatic food chain; (2) oil and grease emulsion may destroy algae or other plankton; (3) oil and grease emulsions may adhere to the gills of fish exerting a toxic effect to fish; and (4) water insoluble components damage the plumage and coats of aquatic animals and fowls. Floating oil may reduce the re-aeration of the water surface, and in conjunction with emulsified oil, may interfere with photosynthesis. In addition to environmental impacts, oil and grease impact the aesthetic qualities of water by forming unsightly surface slicks that affect water beaches and shorelines.

Oil and grease data submitted in part 2 applications for steam electric power generating facilities indicate the following:

- The mean concentration was 1.4 mg/L
- The median concentration was 0.0 mg/L
- The 95th percentile concentration (i.e., 95 percent of the values are below) was 6.0 mg/L
- The 99th percentile concentration (i.e., 99 percent of the values are below) was 20.0 mg/L.

• **pH**—pH is a measure of the acidity or alkalinity of a discharge. On the pH scale ranging from zero to fourteen, a value of seven represents neutral conditions in which the concentrations of hydrogen and hydroxyl ions are equal. Values of pH less than seven represent acidic conditions; values greater than seven represent basic conditions.

The pH level is easily measured and is an indication of potential environmental impacts. Storm water discharges with pH values markedly different from the pH values of the receiving stream are potentially detrimental to the environment. At outfalls and prior to complete mixing of storm water discharges with receiving waters, a zone of sudden pH change can damage or kill biota engulfed in the zone of change. Part 2 applications from steam electric power generating facilities indicated that the minimum pH value was 3.8 standard units.

• **Total Suspended Solids (TSS)**—TSS is associated with steam electric power

generating facilities because sites have exposure to significant materials like coal and refuse piles. Part 2 of the applications indicated high TSS levels. Suspended solids increase the turbidity of water allowing less light to penetrate the water, thereby reducing photosynthetic activity of aquatic vegetation. Over time, total suspended solids settle out to form deposits that can be detrimental to stream environments.

These deposits may destroy fauna that breed and grow in or near the bottoms of streams and serve as food for fish and other aquatic life. The deposits can also blanket and destroy spawning grounds for fish. TSS data submitted in the part 2 applications for steam electric power generating facilities indicate the following:

- The mean concentrations for grab and composite samples were 516.3 mg/L and 212.4 mg/L, respectively
- The median concentrations for grab and composite samples were 44.0 mg/L and 40.0 mg/L, respectively
- The 95th percentile concentration (i.e., 95 percent of the values are below) for grab and composite samples were 1,200 and 810, respectively
- The 99th percentile concentration (i.e., 99 percent of the values are below) for grab and composite samples were 22,790 mg/L and 5,554 mg/L, respectively.

Storm Water Pollution Prevention Plan Requirements

The conditions that apply to steam electric power generating facilities are founded on the requirements set forth in the baseline general permit for storm water discharges from industrial activities finalized on September 9, 1992 (57 FR 41236). The discussion that follows only addresses conditions that differ from those required in the baseline permit. There are no additional pollution prevention requirements beyond the baseline for nuclear powered steam electric generating facilities.

a. Description of pollutant sources.

Under the description of pollutant sources in the storm water pollution prevention plan requirements, permittees are required to include a site map of the facility. The areas required to be identified on the site map now also include the following: Landfills, treatment ponds, scrap yards, general refuse areas, locations of short and long term storage of general materials, and the location of stock pile areas. EPA believes this is appropriate since these areas may potentially be significant sources of pollutants to storm water.

b. **Measures and controls.** Under the description of measures and controls in the storm water pollution prevention plan requirements, this section proposes that all areas that may contribute pollutants to storm water discharges shall be maintained in a clean, orderly manner. This section also proposes that the following areas must be specifically addressed:

(1) **Fugitive dust emissions.** The plan must describe measures that prevent or minimize fugitive dust emissions from coal handling areas. The facility shall establish procedures to minimize offsite tracking of coal dust. To prevent offsite tracking the facility may consider specially designed tires, or washing vehicles in a designated area before they leave the site, and controlling the wash water.

(2) **Delivery vehicles.** The plan must describe measures that prevent or minimize contamination of storm water runoff from delivery vehicles arriving on the plant site. At a minimum the facility must:

- Develop procedures for the inspection of delivery vehicles arriving on the plant site, and ensure overall integrity of the body or container.
- Develop procedures to control leakage or spillage from vehicles or containers, and ensure that proper protective measures are available for personnel and environment.

(3) **Fuel oil unloading areas.** The plan must describe measures that prevent or minimize contamination of storm water runoff from fuel oil unloading areas. At a minimum the facility must use the following measures or their equivalent:

- Use containment curbs in unloading areas.
- During deliveries station personnel familiar with spill prevention and response procedures must be present to ensure that any leaks or spills are immediately contained and cleaned up.
- Use spill and overflow protection (drip pans, drip diapers, and/or other containment devices shall be placed beneath fuel oil connectors to contain any spillage that may occur during deliveries or due to leaks at such connectors).

(4) **Chemical loading/unloading areas.** The plan must describe measures that prevent or minimize the contamination of storm water runoff from chemical loading/unloading areas. At a minimum the permittee must use the following measures or their equivalent:

- Use containment curbs at chemical loading/unloading areas to contain spills.
- During deliveries station personnel familiar with spill prevention and response procedures must be present to

ensure that any leaks or spills are immediately contained and cleaned up.

Where practicable chemical loading/unloading areas should be covered, and chemicals should be stored indoors.

(5) *Miscellaneous loading/unloading areas.* The plan must describe measures that prevent or minimize the contamination of storm water runoff from loading and unloading areas. The facility may consider covering the loading area, minimizing storm water runoff to the loading area by grading, berming, or curbing the area around the loading area to direct storm water away from the area, or locate the loading/unloading equipment and vehicles so that leaks can be controlled in existing containment and flow diversion systems.

(6) *Liquid storage tanks.* The plan must describe measures that prevent or minimize contamination of storm water runoff from above ground liquid storage tanks. At a minimum the facility must employ the following measures or their equivalent:

- Use protective guards around tanks.
- Use containment curbs.
- Use spill and overflow protection (drip pans, drip diapers, and/or other containment devices shall be placed beneath chemical connectors to contain any spillage that may occur during deliveries or due to leaks at such connectors)

- Use dry cleanup methods.

(7) *Large bulk fuel storage tanks.* The plan must describe measures that prevent or minimize contamination of storm water runoff from liquid storage tanks. At a minimum the facility must employ the following measures or their equivalent:

- Comply with applicable State and Federal laws, including Spill Prevention Control and Countermeasures (SPCC)
- Containment berms.

(8) The plan must describe measures to reduce the potential for an oil or chemical spill, or reference the appropriate section of their SPCC plan. At a minimum the structural integrity of all above ground tanks, pipelines, pumps and other related equipment shall be visually inspected on a weekly basis. All repairs deemed necessary based on the findings of the inspections will be completed immediately to reduce the incidence of spills and leaks occurring from such faulty equipment.

(9) *Oil bearing equipment in switchyards.* The plan must describe measures to reduce the potential for storm water contamination from oil bearing equipment in switchyard areas. The facility may consider level grades and gravel surfaces to retard flows and

limit the spread of spills; collection of storm water runoff in perimeter ditches.

(10) *Residue hauling vehicles.* All residue hauling vehicles shall be inspected for proper covering over the load, adequate gate sealing and overall integrity of the body or container. Vehicles without load covers or adequate gate sealing, or with poor body or container conditions must be repaired as soon as practicable.

(11) *Ash loading areas.* Plant procedures shall be established to reduce and/or control the tracking of ash or residue from ash loading areas including, where practicable, requirements to clear the ash building floor and immediately adjacent roadways of spillage, debris and excess water before each loaded vehicle departs.

(12) *Areas adjacent to disposal ponds or landfills.* The plan must describe measures that prevent or minimize contamination of storm water runoff from areas adjacent to disposal ponds or landfills. The facility must develop procedures to:

- Reduce ash residue which may be tracked on to access roads traveled by residue trucks or residue handling vehicles.
- Reduce ash residue on exit roads leading into and out of residue handling areas.

(13) *Landfills, scrapyard, general refuse sites.* For landfills, scrapyards, and general refuse sites, the permittee shall use the applicable Best Management Practices outlined in Parts XI.L. and XL.N. of today's proposed (Storm Water Discharges From Landfills, Land Application Sites, and Open Dumps and Scrap and Waste Material Processing and Recycling Facilities, respectively).

(14) *Maintenance activities.* For vehicle maintenance activities performed on the plant site, the permittee shall use the applicable Best Management Practices outlined in Part XI.Q. of today's proposed permit (Storm Water Discharges From Vehicle Maintenance or Equipment Cleaning Operations at Motor Freight Transportation Facilities, Passenger Transportation Facilities, Petroleum Bulk Oil Stations and Terminals, or the United States Postal Service).

(15) *Material storage areas.* The plan must describe measures that prevent or minimize contamination of storm water from material storage areas (including areas used for temporary storage of miscellaneous products and construction materials stored in lay down areas). The facility may consider flat yard grades, runoff collection in graded swales or ditches, erosion

protection measures at steep outfall sites (e.g., concrete chutes, riprap, stilling basins), covering lay down areas, storing the materials indoors, covering the material with a temporary covering made of polyethylene, polyurethane, polypropylene, or hypalon. Storm water runoff may be minimized by constructing an enclosure or building a berm around the area.

Based on information provided in part 1 of the group application process, the proposed management practices are commonly used at many steam electric power generating facilities. EPA believes that the incorporation of management practices to accomplish the objectives described above, in conjunction with the baseline requirements, will substantially reduce the potential for these activities and areas to significantly contribute to the pollution of storm water discharges. EPA believes that these requirements provide the necessary flexibility to address the variable risk for pollutants in storm water discharges associated with different facilities.

(16) *Inspections.* Under the inspection requirements of the storm water pollution prevention plan elements, this section proposes that in addition to the comprehensive site evaluation required under Part VIII.C.4. of today's proposed permit, qualified facility personnel shall be identified to inspect designated equipment and areas of the facility on a monthly basis. The following areas shall be included in the inspection: coal handling areas, fueling areas, loading/unloading areas, switchyards, bulk storage areas, ash handling areas, areas adjacent to disposal ponds and landfills, maintenance areas, liquid storage tanks and long term and short term material storage areas. A set of tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections. Records of inspections shall be maintained onsite.

The purpose of the inspections is to check on the implementation of the storm water pollution prevention plan. The inspections allow facility personnel to monitor the success or failure of elements of the plan on a regular basis.

4. *Pollutant Control Measures Required Through Other EPA Programs.* The Agency recognizes that other EPA programs address pollution prevention at steam electric power generating facilities. The Oil Pollution Prevention Program (40 CFR part 112) has established procedures to prevent the discharge of oil from nontransportation related onshore and offshore facilities. This program requires owners or operators of onshore and offshore facilities to prepare a Spill Prevention

Control and Countermeasure Plan (SPCC Plan) for their facility if they could reasonably be expected to discharge oil, into or upon the navigable waters of the United States or adjoining shorelines, in quantities that:

- Violate applicable water quality standards, or;
- Cause a film or sheen upon or discoloration of the surface of the water or adjoining shorelines or cause a sludge or emulsion to be deposited beneath the surface of the water or upon adjoining shorelines.

Some major requirements of the SPCC plan include the following:

- A description of spill and corrective actions taken.

- Appropriate containment and/or diversionary structures or equipment to prevent discharged oil from reaching a navigable water course. If installation of structures to prevent discharged oil from reaching the navigable waters is not practicable, the owner or operator should clearly demonstrate such impracticability and provide a spill contingency plan and a written commitment of manpower, equipment, and materials required to expeditiously control and remove oil.

- Drainage from diked storage areas should be restrained by valves or other positive means to prevent a spill or excessive leakage of oil into the drainage system or in-plant effluent treatment system.

- Flapper type drain valves should not be used to drain diked areas.

- Plant drainage systems from undiked areas should, if possible, flow into ponds, lagoons or catchment basins designed to retain oil or return it to the facility.

- If plant drainage is not engineered as above, the final discharge of all in-plant ditches should be equipped with a diversion system that could, in the event of an uncontrolled spill, return the oil to the plant.

- Requirements for bulk storage tanks include, but are not limited to, the following:

- Material and construction of tanks
 - need to be compatible with the material stored and conditions of storage such as pressure, temperature, etc.
- Secondary containment should be provided for the entire contents of the largest single tank plus sufficient freeboard to allow for precipitation.
- Drainage of rainwater from the diked area into a storm drain or an effluent discharge that empties into an open in-plant water course, lake or pond and bypassing the in-plant treatment system may be acceptable if: bypass

valve is normally sealed closed; inspection of runoff rain water ensures compliance with applicable water quality standards and will not cause a harmful discharge and adequate records are kept.

- Above-ground tanks should be subject to periodic integrity testing.

- New and old tank installations should, as practicable, be fail safe engineered

Under the Resource Conservation and Recovery Act (RCRA) specific requirements have been established which address generators of hazardous wastes. Regulations have been developed which address the accumulation of hazardous waste onsite prior to transport to a hazardous waste disposal facility. These regulations address proper storage of hazardous wastes, emergency planning, and training personnel in proper handling procedures for hazardous wastes.

5. Numeric Effluent Limitations

Coal pile runoff is subject to the effluent guidelines described in Part VI.F. of this factsheet. However, steam electric generating facilities must comply with the requirement of Part VI.F. immediately upon permit issuance. Steam electric generating facilities are not permitted to take 3 years to meet this requirement.

6. Monitoring and Reporting Requirements

a. Analytical monitoring requirements. EPA believes that steam electric power generating facilities may reduce the level of pollutants in storm water runoff from their sites through the development and proper implementation of the storm water pollution prevention plan requirements discussed in today's proposed permit. In order to provide a tool for evaluating the effectiveness of the pollution prevention plan and to characterize the discharge for potential environmental impacts, the proposed permit requires steam electric power generating facilities to collect and analyze samples of their storm water discharges for the pollutants listed in Table O-4. The pollutants listed in Table O-4 were found to be above levels of concern for a significant portion of steam electric power generating facilities that submitted quantitative data in the group application process, or are believed to be present based upon the description of industrial activities and significant materials exposed. Because these pollutants have been reported at levels of concern from steam electric power generating facilities, EPA is requiring monitoring after the pollution prevention plan has been

implemented to assess the effectiveness of the pollution prevention plan and to help ensure that a reduction of pollutants is realized.

At a minimum, storm water discharges from steam electric power generating facilities must be monitored quarterly during the second year of permit coverage. At the end of the second year of permit coverage, a facility must calculate the average concentration for each parameter listed in Table O-4. If the permittee collects more than four samples in this period, then they must calculate an average concentration for each pollutant of concern for all samples analyzed.

TABLE O-4.—MONITORING REQUIREMENTS FOR STEAM ELECTRIC POWER GENERATING FACILITIES

| Pollutants of concern | Cut-off concentration |
|------------------------------|-----------------------|
| Total recoverable copper .. | 0.009 mg/L |
| Total recoverable aluminum. | 0.75 mg/L |
| Total recoverable arsenic . | 0.00018 mg/L |
| Total recoverable iron | 0.3 mg/L |
| Total recoverable lead | 0.0337 mg/L |
| Total recoverable manganese. | 0.05 mg/L |

If the average concentration for a parameter is less than or equal to the value listed in Table O-4, then the permittee is not required to conduct quantitative analysis for that parameter during the fourth year of the permit. If, however, the average concentration for a parameter is greater than the cut-off concentration listed in Table O-4, then the permittee is required to conduct quarterly monitoring for that parameter during the fourth year of permit coverage. Monitoring is not required during the first, third, and fifth year of the permit. The exclusion from monitoring in the fourth year of the permit is conditional on the facility maintaining industrial operations and BMPs that will ensure a quality of storm water discharges consistent with the average concentrations recorded during the second year of the permit.

TABLE O-5.—SCHEDULE OF MONITORING

| | |
|------------------------------|--|
| 2nd year of permit coverage. | <ul style="list-style-type: none"> • Conduct quarterly monitoring. • Calculate the average concentration for all parameters analyzed during this period. • If average concentration is greater than the value listed in Table O-4, then quarterly sampling is required during the fourth year of the permit. • If average concentration is less than or equal to the value listed in Table O-4, then no further sampling is required for that parameter. |
| 4th year of permit coverage. | <ul style="list-style-type: none"> • Conduct quarterly monitoring for any parameter where the average concentration in year two of the permit is greater than the value listed in Table O-4. • If industrial activities or the pollution prevention plan have been altered such that storm water discharges may be adversely affected, quarterly monitoring is required for all parameters of concern. |

In cases where the average concentration of a parameter exceeds the cut-off concentration, EPA expects permittees to place special emphasis on methods for reducing the presence of those parameters in storm water discharges. Quarterly monitoring in the fourth year of the permit will reassess the effectiveness of the adjusted pollution prevention plan.

The monitoring cut off concentrations listed in Table O-4 are not numerical effluent limitations. These values represent a level of pollutant discharge which facilities may achieve through the implementation of pollution prevention plans. At least half of the facilities which submitted Part 2 data, reported concentrations less than or equal to the values listed in Table O-4. Facilities which achieve average discharge concentrations which are less than or equal to the values in Table O-4 are not relieved from the pollution prevention plan requirements or any other requirements of the permit.

b. Alternative certification. Throughout today's permit, EPA has proposed monitoring requirements for facilities which the Agency believes have the potential for contributing significant levels of pollutants to storm water discharges. The alternative described below is necessary to ensure that monitoring requirements are only imposed on those facilities which do, in

fact, have storm water discharges containing pollutants at concentrations of concern. EPA has determined that if materials and activities are not exposed to storm water at the site then the potential for pollutants to contaminate storm water discharges does not warrant monitoring.

Therefore, a discharger is not subject to the monitoring requirements of this Part provided the discharger makes a certification for a given outfall, on an annual basis, under penalty of law, signed in accordance with Part VII.G. (Signatory Requirements), that material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, industrial machinery or operations, significant materials from past industrial activity, or, in the case of airports, deicing activities, that are located in areas of the facility that are within the drainage area of the outfall are not presently exposed to storm water and will not be exposed to storm water for the certification period. Such certification must be retained in the storm water pollution prevention plan, and submitted to EPA in accordance with Part VI.C. of this permit.

c. Reporting requirements. Permittees are required to submit all monitoring results obtained during the second and fourth year of permit coverage within three months of the conclusion of each year. Such permittees must submit monitoring results on four separately signed Discharge Monitoring Report Forms to the Director. For facilities conducting monitoring beyond the minimum quarterly requirements an additional Discharge Monitoring Report Form must be filed for each analysis.

d. Sample type. All discharge data shall be reported for grab samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The grab sample shall be taken during the first thirty minutes of the discharge. If the collection of a grab sample during the first thirty minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first thirty minutes was impracticable.

If storm water discharges associated with industrial activity commingle with process or non-process water, then where practicable permittees must attempt to sample the storm water

discharge before it mixes with the non-storm water discharge.

EPA requests comments upon a condition of today's proposed permit that would require permittees who are unable to sample storm water discharges before they commingle with non-storm water discharges to sample the combined discharge both during dry and wet weather and submit both sets of data to the permitting authority.

e. Representative discharge. When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may test the effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfalls provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explaining in detail why the outfalls are expected to discharge substantially identical effluent. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area (e.g. low (under 40 percent), medium (40 to 65 percent) or high (above 65 percent)) shall be provided in the plan.

f. Monthly visual examination of storm water quality. Monthly visual inspections of storm water discharges from each outfall are required at steam electric generating facilities. The inspection must be of a grab sample collected from each storm water outfall. The examination of storm water grab samples shall include any observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, or other obvious indicators of storm water pollution. The inspection must be conducted in a well lit area. No analytical tests are required to be performed on these samples.

The examination must be made at least once in each month of the permit during daylight unless there is insufficient rainfall or snow-melt to runoff. EPA expects that whenever practicable the same individual should carry out the collection and examination of discharges throughout the life of the permit to ensure the greatest degree of consistency possible. Grab samples shall be collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 60 minutes) of when the runoff begins discharging. Reports of the visual observation include: The

examination date and time, examination personnel, visual quality of the storm water discharge, and probable sources of any observed storm water contamination. The visual observation reports must be maintained on site with the pollution prevention plan.

EPA believes that this quick and simple assessment will allow the permittee to approximate the effectiveness of his/her plan on a regular basis at very little cost. Although the visual examination cannot assess the chemical properties of the storm water discharged from the site, the examination will provide meaningful results upon which the facility may act quickly. The frequency of this visual inspection will also allow for timely adjustments to be made to the plan. If BMPs are performing ineffectively, corrective action must be implemented. A set of tracking or follow-up procedures must be used to ensure that appropriate actions are taken in response to the inspections. The visual examination is intended to be performed by members of the pollution prevention team. This hands on inspection will enhance the staff's understanding of the storm water problems on that site and effects on the management practices that are included in the plan.

When a discharger is unable to collect samples over the course of the monitoring period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create

dangerous conditions for personnel (such as local flooding, high winds, hurricanes, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

g. Baseline general permit variance. On September 9, 1992, and September 25, 1992, EPA published the Final NPDES General Permits for Storm Water Discharges Associated with Industrial Activity. These notices set out requirements for annual monitoring for several parameters for discharges from steam electric power generating facilities. These notices specifically require coal-fired steam electric facilities to monitor their storm water discharges for oil and grease, pH, total suspended solids, total recoverable copper, total recoverable nickel, and total recoverable zinc. In addition, the baseline general permit established monitoring requirements for oil-fired steam electric power generating facilities. The baseline specifically requires oil-fired steam electric facilities to monitor their storm water discharges for oil and grease, chemical oxygen demand, total suspended solids, pH, and any pollutant limited in an effluent guideline to which the facility is subject. Today's proposed permit contains monitoring requirements different than those in the baseline permit. EPA requests comment upon the difference between the monitoring requirements set out for steam electric power generating facilities in the September 1992, General Permits and those required in today's proposed permit.

7. Alternative Monitoring Requirements

EPA requests comment upon the following monitoring and reporting requirements in lieu of those listed in Part XI.O.6 of today's proposed fact sheet.

a. Monitoring requirements. During the period beginning on the effective date and lasting through the expiration date of this permit, permittee with facilities identified in Parts XI.O.5.a.(1) through XI.O.5.a.(2) below must monitor storm water discharges for the listed parameters on a frequency identified in the applicable paragraph, except as provided in VI.C. (Sampling Waiver and Representative Discharge). In addition to the parameters listed below, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event which generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

(1) Storm water discharges from the industrial portions of coal-fired, and coal/oil-fired steam electric power generating facilities shall monitor for the following parameters (other than discharges in whole or in part from coal piles subject to storm water effluent guidelines at 40 Code of Federal Regulations (CFR) part 423—which are not eligible for coverage under this permit):

TABLE O-6.—MONITORING REQUIREMENTS FOR COAL-FIRED AND COAL/OIL-FIRED STEAM ELECTRIC POWER GENERATING FACILITIES

| Parameter | Units | Frequency | Sample Type ¹ |
|---|------------|-----------------|--------------------------|
| Total flow | mg | Quarterly | Estimate. |
| Oil and grease | mg/L | Quarterly | Grab. |
| pH | s.u. | Quarterly | Grab. |
| Total suspended solids (TSS) | mg/L | Quarterly | Grab & Composite. |
| Total recoverable nickel ² | mg/L | Quarterly | Grab & Composite. |
| Total recoverable zinc ² | mg/L | Quarterly | Grab & Composite. |
| Total recoverable copper ² | mg/L | Quarterly | Grab & Composite. |
| Chemical oxygen demand ² (COD) | mg/L | Quarterly | Grab & Composite. |

¹ For discharges from holding ponds or other impoundments with a retention period greater than 24 hours (estimated by dividing the volume of the detention pond by the estimated volume of water discharged during the 24 hours previous to the time that the sample is collected), a minimum of one grab sample may be taken in lieu of a grab sample and a composite sample.

² In addition to monitoring for flow, oil and grease, and TSS, storm water discharges which drain from coal handling sites (other than discharges in whole or in part from coal piles subject to storm water effluent guidelines at 40 CFR Part 423—which are not eligible for coverage under this permit) shall be monitored for total recoverable copper, total recoverable nickel, and total recoverable zinc.

³ Chemical Oxygen Demand shall be monitored at Steam Electric Power Generating Facilities which utilize coal and oil in their production process.

In addition to the above sampling parameters the permittee is required to monitor storm water discharges for any pollutant limited in an effluent

guideline to which the facility is subject. Sampling frequency shall be quarterly, and sample type shall be grab and composite.

Monitoring must be conducted at least once in each designated period unless there is insufficient rainfall or snow-melt to produce a runoff event.

Sampling shall be conducted in each of the following periods for the purposes of meeting the monitoring requirements of this permit: December to February (storm water runoff or snow melt);

March to May (storm water runoff); June to August (storm water runoff); September to November (storm water runoff or snow melt).

(2) Storm water discharges from the industrial portions of oil-fired, gas-fired, or oil/gas-fired steam electric power generating facilities shall monitor for the following parameters:

TABLE O-7.—MONITORING REQUIREMENTS FOR OIL-FIRED, GAS-FIRED, AND OIL/GAS-FIRED STEAM ELECTRIC POWER GENERATING FACILITIES

| Parameter | Units | Frequency | Sample type ¹ |
|------------------------------------|------------|-----------------|--------------------------|
| Total flow | MG | Quarterly | Estimate. |
| Oil & grease | mg/L | Quarterly | Grab. |
| pH | mg/L | Quarterly | Grab. |
| Total suspended solids (TSS) | mg/L | Quarterly | Grab & Composite. |
| Chemical oxygen demand (COD) | mg/L | Quarterly | Grab & Composite. |

¹For discharges from holding ponds or other impoundments with a retention period greater than 24 hours (estimated by dividing the volume of the detention pond by the estimated volume of water discharged during the 24 hours previous to the time that the sample is collected), a minimum of one grab sample may be taken in lieu of a grab sample and a composite sample.

In addition to the above sampling parameters, the permittee is required to monitor storm water discharges for any pollutant limited in an effluent guideline to which the facility is subject. Sampling frequency shall be quarterly, and sample type shall be grab and composite.

Monitoring must be conducted at least once in each designated period unless there is insufficient rainfall or snow-melt to produce a runoff event. Sampling shall be conducted in each of the following periods for the purposes of meeting the monitoring requirements of this permit: December to February (storm water runoff or snow melt); March to May (storm water runoff); June to August (storm water runoff); September to November (storm water runoff or snow melt).

b. Sample type—(1) All samples shall be collected from a discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 48 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The grab sample shall be taken during the first 60 minutes of the discharge. If the collection of a grab sample during the first 60 minutes is impracticable, a grab sample can be taken during the first 3 hours of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 60 minutes was impracticable.

(2) The composite sample shall either be flow-weighted or time-weighted. Composite samples may be taken with a continuous sampler or as a combination of a minimum of three sample aliquot taken in each hour of discharge for the entire discharge or for the first 3 hours of the discharge, with each aliquot being separated by a minimum period of 15 minutes.

c. Permittee with facilities identified in Part XI.O.7.a. (Monitoring Requirements) are not required to submit monitoring results, unless required in writing by the Director.

However, permittee must retain monitoring results in accordance with Part VI.E.4. (Retention of Records).

Quarterly visual inspections of a storm water discharge from each outfall are required. The visual inspection of storm water outfalls shall include any observations of color, odor, turbidity, floating solids, foam, oil sheen, or other obvious indicators of storm water pollution. No analytical tests are required to be performed on these samples.

The examination must be made at least once in each designated period during daylight hours unless there is insufficient rainfall or snow-melt to runoff. EPA expects that, whenever practicable, the same individual should carry out the collection and examination of discharges throughout the life of the permit to ensure the greatest degree of consistency possible. Examinations shall be conducted in each of the following periods for the purposes of inspecting storm water quality associated with storm water runoff and snow melt: December to February; March to May; June to August; September to November. Grab samples shall be collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 60 minutes) of when the runoff begins discharging. Reports of the visual observation include: the examination date and time, examination personnel, visual quality of the storm water discharge, and probable sources of any observed storm water contamination. The visual observation reports must be maintained onsite with the pollution prevention plan.

When a discharger is unable to collect samples over the course of the

monitoring period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

P. Storm Water Discharges Associated With Industrial Activity From Motor Freight Transportation Facilities, Passenger Transportation Facilities, Petroleum Bulk Oil Stations and Terminals, Rail Transportation Facilities, and United States Postal Service Transportation Facilities

1. Discharges Covered Under This Section

Special conditions have been developed for ground transportation facilities and rail transportation facilities that have vehicle and equipment maintenance shops (vehicle and equipment rehabilitation, mechanical repairs, painting, fueling and lubrication) and equipment cleaning operations. Vehicle and equipment maintenance is a broad term used to include the following activities: vehicle and equipment fluid changes, mechanical repairs, parts cleaning, sanding, refinishing, painting, fueling, locomotive sanding (loading sand for traction), storage of vehicles and equipment waiting for repair or maintenance, and storage of the related materials and waste materials, such as oil, fuel, batteries, tires, or oil filters. Equipment cleaning operations include areas where the following types of activities take place: vehicle exterior wash down, interior trailer washouts,

tank washouts, and rinsing of transfer equipment. Any storm water discharges from facilities where such activities take place are subject to the special conditions described in Part XLP. of today's proposed permit.

The conditions proposed in this section apply to storm water discharges from vehicle and equipment maintenance shops or cleaning operations located on any of the industrial facilities covered under the storm water application regulations (40 CFR 122.26) and applying for coverage under this permit.

As background, the storm water application regulations define storm water discharge associated with industrial activity at 40 CFR 122.26(b)(14). Category (viii) of this definition includes transportation facilities classified as Standard Industrial Classification (SIC) codes 40, 41, 42 (except 4221-25), 43, 44, 45, and 5171 that have vehicle and equipment maintenance shops, equipment cleaning operations, or airport deicing operations. The category further states that only those portions of the facility that are either involved in vehicle and equipment maintenance (including vehicle and equipment rehabilitation, mechanical repairs, painting, fueling, and lubrication), equipment cleaning operations, or airport deicing operations are associated with industrial activity. The facilities that would potentially be covered by this section of today's proposed permit are commonly assigned SIC codes 40, 41, 42, 43, and 5171, or any other SIC code described in the eligibility section of today's proposed permit.

SIC code 40 includes facilities primarily engaged in furnishing transportation by line-haul railroad, and switching and terminal establishments. The following types of facilities are examples of those covered under SIC code 40: Electric railroad line-haul operation, railroad line-haul operation, interurban railways, beltline railroads, logging railroads, railroad terminals, and stations operated by railroad terminal companies.

SIC code 41 includes facilities primarily engaged in furnishing local and suburban transportation, such as those providing transportation in and around a municipality by bus, rail, or subway. The following types of facilities are examples of those covered under SIC code 41: bus line operation, airport transportation service (road or rail), cable car operation, subway operation, ambulance service, sightseeing buses, van pool operation, limousine rental with drivers, taxicab operation, and school buses not operated by the educational institution.

SIC code 42 includes facilities providing local or long-distance trucking, transfer, and/or storage services. The following types of facilities are examples of those covered under SIC code 42: hauling by dump truck, trucking timber, contract mail carriers, furniture moving, garbage collection without disposal, over-the-road trucking, long distance trucking, and freight trucking terminal.

SIC code 43 includes all establishments of the United States Postal Service.

SIC code 5171 includes establishments engaged in the wholesale distribution of crude petroleum and

petroleum products from bulk liquid storage facilities.

When an industrial facility, described by the above eligibility provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

If monitoring and pollution prevention plan requirements of another industrial activity section of this permit apply to co-located industrial activities at an industrial facility, the eligibility provisions of that industrial activity section shall not preclude the operator of the industrial facility from complying with the applicable monitoring and pollution prevention plan requirements of that section.

2. Pollutants Found in Storm Water Discharges From Vehicle and Equipment Maintenance and Cleaning Operations

The following table lists potential pollutant source activities that commonly take place at vehicle and equipment maintenance and equipment cleaning operations.

TABLE P-1.—POTENTIAL POLLUTANT SOURCE ACTIVITIES AT VEHICLE AND EQUIPMENT MAINTENANCE

| Activity | Pollutant source | Pollutant |
|--|---|--|
| Fueling | Spills and leaks during fuel delivery | Fuel, oil, heavy metals. |
| | Spills caused by "topping off" fuel tanks | Fuel, oil, heavy metals. |
| | Rainfall falling on the fuel area or storm water running onto the fuel area. | Fuel, oil, heavy metals. |
| | Hosing or washing down fuel area | Fuel, oil, heavy metals. |
| | Leaking storage tanks | Fuel, oil, heavy metals. |
| Vehicle and equipment maintenance. | Parts cleaning | Chlorinated solvents, oil, heavy metals, acid/alkaline wastes. |
| | Waste disposal of greasy rags, oil filters, air filters, batteries, hydraulic fluids, transmission fluid, radiator fluids, degreasers. | Oil, heavy metals, chlorinated solvents, acid/alkaline wastes, ethylene glyco. |
| | Spills of oil, degreasers, hydraulic fluids, transmission fluid, radiator fluids. | Oil, arsenic, heavy metals, organics, chlorinated solvents, ethylene glycol. |
| | Fluids replacement, including oil, hydraulic fluids, transmission fluid, radiator fluids. | Oil, arsenic, heavy metals, organics, chlorinated solvents, ethylene glycol. |
| Outdoor vehicle and equipment storage and parking. | Leaking vehicle fluids including hydraulic lines and radiators, leaking or improperly maintained locomotive on-board drip collection systems, brake dust. | Oil, hydraulic fluids, arsenic, heavy metals, organics, fuel. |
| Painting areas | Paint and paint thinner spills | Paint, spent chlorinated solvents heavy metals. |
| | Spray painting | Paint solids, heavy metals. |
| | Sanding or paint stripping | Dust, paint solids, heavy metals |

TABLE P-1.—POTENTIAL POLLUTANT SOURCE ACTIVITIES AT VEHICLE AND EQUIPMENT MAINTENANCE—Continued

| Activity | Pollutant source | Pollutant |
|---|--|---|
| Railroad locomotive sanding | Paint clean-up | Paint, spent chlorinated solvents, heavy metals. |
| Vehicle or equipment washing areas. | Loading traction sand on locomotives | Sediment. |
| Liquid storage in above ground storage. | Washing or steam cleaning | Oil, detergents, heavy metals, chlorinated solvents, phosphorus, salts, suspended solids. |
| | External corrosion and structural failure | Fuel, oil, heavy metals, materials being stored. |
| | Installation problems | Fuel, oil, heavy metals, materials being stored. |
| | Spills and overfills due to operator error | Fuel, oil, heavy metals, materials being stored. |
| | Failure of piping systems (pipes, pumps, flanges, couplings, hoses, and valves). | Fuel, oil, heavy metals, materials being stored. |
| | Leaks or spills during pumping of liquids from barges, trucks, or rail cars to a storage facility. | Fuel, oil, heavy metals, materials being stored. |
| Cold weather activities | Salt application | Sodium chloride. |
| | Dirt/ash application | Suspended solids, heavy metals. |
| Improper connections to storm sewer. | Process wastewater | Dependent on operations. |
| | Sanitary water | Bacteria, biochemical oxygen demand (BOD), suspended solids. |
| | Floor drains | Oil, heavy metals, chlorinated solvents, fuel, ethylene glycol. |
| | Vehicle washwaters | Oil, detergents, metals, chlorinated solvents, phosphorus, suspended solids. |
| | Radiator flushing wastewater | Ethylene glycol. |
| | Leaky underground storage tanks | Materials stored or previously stored. |

Table P-9 lists the pollutant sources for each of the main pollutants of concern.

TABLE P-9.—PARAMETER/SOURCE RELATIONSHIPS

| Parameter | Pollutant Sources |
|-------------------------------|---|
| Chemical oxygen demand (COD). | Ethylene glycol, fuels, paints, solvents, degreasers. |

TABLE P-9.—PARAMETER/SOURCE RELATIONSHIPS—Continued

| Parameter | Pollutant Sources |
|-----------------|--|
| Oil & grease .. | Used oil, fuels, lubricating fluids, fuel oil, transmission fluid. |

TABLE P-9.—PARAMETER/SOURCE RELATIONSHIPS—Continued

| Parameter | Pollutant Sources |
|-------------------------------|--|
| pH | Battery acids, detergents, other acidic or alkaline materials. |
| Total suspended solids (TSS). | Bare soils, tracked sediment, vehicle washwaters. |
| MBAs (surfactants). | Washwaters, leaking detergent storage. |

The mean and median pollutant levels associated with facilities

providing trucking, transfer, and/or storage services (SIC 42) and U.S. Postal Service facilities (SIC 43) were lower than those associated with the other ground transportation groups. However, there were significant differences between the mean and the median for most parameters, indicating a high variability in the data. On the whole, these three groups, in their part 1 group applications, described more storm water management practices at their facilities than the other ground transportation groups.

3. Options for Controlling Pollutants.

The measures commonly implemented to reduce pollutants in storm water associated with vehicle and equipment maintenance and equipment cleaning operations are generally uncomplicated practices. The following table identifies best management practices (BMPs) associated with different activities that routinely take place at vehicle and equipment maintenance and equipment cleaning operations.

TABLE P-10.—COMMON STORM WATER BEST MANAGEMENT PRACTICES FOR ACTIVITIES AT VEHICLE AND EQUIPMENT MAINTENANCE

| Activity | BMPs |
|--|--|
| Fueling | <p>Use spill and overflow protection.</p> <p>Minimize runoff of storm water into the fueling area by grading the area such that storm water only runs off.</p> <p>Reduce exposure of the fuel area to storm water by covering the area.</p> <p>Use dry cleanup methods for fuel area rather than hosing the fuel area down.</p> <p>Use proper petroleum spill control.</p> <p>Perform preventive maintenance on storage tanks to detect potential leaks before they occur.</p> <p>Inspect the fueling area to detect problems before they occur.</p> <p>Train employees on proper fueling techniques.</p> |
| Vehicle and equipment maintenance | <p>Maintain an organized inventory of materials used in the maintenance shop.</p> <p>Dispose of greasy rags, oil filters, air filters, batteries, spent coolant, and degreasers properly.</p> <p>Label and track the recycling of waste material (e.g., used oil, spent solvents, batteries).</p> <p>Drain oil filters before disposal or recycling.</p> <p>Drain and contain all fluids from wrecked vehicles and "parts" cars.</p> <p>Store cracked batteries in a nonleaking secondary container.</p> <p>Promptly transfer used fluids to the proper container; do not leave full drip pans or other open containers around the shop. Empty and clean drip pans and containers.</p> <p>Do not pour liquid waste down floor drains, sinks, or outdoor storm drain inlets.</p> <p>Plug floor drains that are connected to the storm or sanitary sewer; if necessary, install a sump that is pumped regularly.</p> <p>Inspect the maintenance area regularly for proper implementation of control measures.</p> <p>Train employees on proper waste control and disposal procedures.</p> <p>Use drip pans under all vehicles and equipment waiting for maintenance.</p> |
| Outdoor vehicle and equipment storage and parking. | <p>Cover the storage area with a roof.</p> <p>Inspect the storage yard for filling drip pans and other problems regularly.</p> <p>Train employees on procedures for storage and inspection items.</p> |
| Locomotive sanding areas | <p>Cover sand storage piles.</p> <p>Install sediment traps.</p> |
| Painting areas | <p>Install curbs or dikes around storage piles to minimize storm water runoff.</p> <p>Keep paint and paint thinner away from traffic areas to avoid spills.</p> <p>Spray paint in an Occupational Safety and Health Act (OSHA) approved hood.</p> <p>Use effective spray equipment that delivers more paint to the target and less over-spray.</p> <p>Avoid sanding in windy weather and collect and dispose of waste properly.</p> <p>Recycle paint, paint thinner, and solvents.</p> <p>Inspect painting procedures to ensure that they are conducted properly.</p> <p>Train employees on proper sanding, painting, and spraying techniques.</p> |
| Vehicle or equipment washing areas | <p>Avoid washing parts or equipment outside.</p> <p>Use phosphate-free biodegradable detergents.</p> <p>Designate an area for cleaning activities.</p> <p>Contain and recycle washwaters.</p> <p>Ensure that washwaters drain well.</p> <p>Inspect cleaning area regularly.</p> <p>Train employees on proper washing procedures.</p> |
| Liquid storage in above ground storage | <p>Maintain good integrity of all storage containers.</p> <p>Install safeguards (such as diking or berming) against accidental releases at the storage area.</p> <p>Inspect storage tanks to detect potential leaks and perform preventive maintenance.</p> <p>Inspect piping systems (pipes, pumps, flanges, couplings, hoses, and valves) for failures or leaks.</p> |
| Cold weather activities | <p>Train employees on proper filling and transfer procedures.</p> <p>Minimize salt application.</p> <p>Use uncontaminated dirt or ash, if use is necessary.</p> <p>Train employees on proper salt, dirt, sand, or ash application.</p> |

TABLE P-10.—COMMON STORM WATER BEST MANAGEMENT PRACTICES FOR ACTIVITIES AT VEHICLE AND EQUIPMENT MAINTENANCE—Continued

| Activity | BMPs |
|---|--|
| Improper connections to storm sewer | Plug all floor drains connected to sanitary or storm sewer or if connection is unknown. Alternatively, install a sump that is pumped regularly. Perform smoke or dye testing to determine if interconnections exist between sanitary water system and storm sewer system. Update facility schematics to accurately reflect all plumbing connections. Install a safeguard against vehicle washwaters entering the storm sewer unless permitted. Maintain and inspect the integrity of all underground storage tanks; replace when necessary. Train employees on proper disposal practices for all materials. |

4. Pollutant Control Measures Required Through Other EPA Programs

EPA recognizes that other programs address the operation of vehicle and equipment maintenance and equipment cleaning operations. In particular, as described below, the Resource Conservation and Recovery Act (RCRA) and the Underground Storage Tank (UST) programs require careful management of materials used onsite which decreases the probability that storm water from such areas will be contaminated by these materials.

Under the RCRA program, on September 10, 1992, EPA promulgated standards in 40 CFR Part 279 for the management of used oils that are recycled (57 FR 41566). These standards include requirements for used oil generators, transporters, processors/refiners, and burners. The standards for used oil generators apply to all generators, regardless of the amount of used oil they generate. Do-it-yourself (DIY) generators which generate used oil from the maintenance of their personal vehicles, however, are not subject to the management standards (Section 279.20(a)(1)).

The requirements for used oil generators were designed to impose a minimal burden on generators while protecting human health and the environment from the risks associated with managing used oil. Under Subpart C of 40 CFR Part 279, used oil generators must not store used oil in units other than tanks, containers, or units subject to regulation under Part 264 or 265 of 40 CFR (Section 279.22(a)). In other words, generators may store used oil in tanks or containers that are not subject to Subpart J (Hazardous Waste Tanks) or Subpart I (Containers) of Parts 264/265, as long as

such tanks or containers are maintained in compliance with the used oil management standards. This does not preclude generators from storing used oil in Subpart J tanks or Subpart I containers or other units, such as surface impoundments (Subpart K), that are subject to regulation under Part 264 or 265.

Storage units at generator facilities must be maintained in good condition and labeled with the words "used oil." Upon detection of a release of used oil to the environment, a generator must take steps to stop the release, contain the released used oil, and properly manage the released used oil and other materials (Sections 279.22(b) to (d)). Generators storing used oil in underground storage tanks are subject to the UST regulations in 40 CFR Part 280.

If used oil generators ship used oil offsite for recycling, they must use a transporter who has notified EPA and obtained an EPA identification number (Section 279.24).

The technical standards for USTs at 40 CFR Part 280 require that new UST systems (defined as systems for which installation commenced after December 12, 1988) use overfill prevention equipment that will: (1) Automatically shut off flow into the tank when the tank is no more than 95 percent full; or (2) alert the transfer operator when the tank is no more than 90 percent full by restricting the flow into the tank or triggering a high level alarm. The preceding requirements do not apply to systems that are filled by transfers of no more than 25 gallons at one time. Existing UST systems (defined as systems for which installation has commenced on or before December 12, 1988) are required to have installed the described overfill prevention equipment by December 12, 1998.

5. Special Conditions

The permit conditions that apply to ground transportation facilities build upon the requirements set forth in the baseline general permit for storm water discharges from industrial activities finalized on September 9, 1992 (57 FR 41236). The discussion that follows, therefore, only addresses conditions that differ from those required in the baseline permit.

Due to concern that many non-storm water discharges may be present at vehicle and equipment cleaning and maintenance facilities, EPA is requiring that all facilities provide proof that these discharges are not commingled and are appropriately controlled so as to protect all receiving waters.

Today's proposed permit clarifies in Part III.A. (Prohibition of Non-storm Water Discharges) that non-storm water discharges, including vehicle and equipment washwaters, are not authorized by this permit. The operators of such non-storm water discharges must obtain coverage under a separate NPDES permit if discharged to waters of the U.S. or through a municipal separate storm sewer system or comply with applicable industrial pretreatment requirements if discharged to a municipal sanitary sewer system. In a related requirement under the storm water pollution prevention plan requirements, the permittee is required to attach a copy of the NPDES permit issued for vehicle washwaters or, if an NPDES permit has not yet been issued, a copy of pending application to the plan. For facilities that discharge vehicle and equipment washwaters to the sanitary sewer system, the operator of the sanitary system and associated treatment plant must be notified. A copy of the notification letter must be

attached to the plan. If an industrial user permit is issued under a pretreatment program, a copy of that permit must be attached in the plan as does any other permit to which the facility is subject. Some facilities may use other methods of disposal, such as collecting and hauling the wash water offsite. In these cases, the facility must document how the wash water is disposed and attach all pertinent documentation of that disposal practice to the plan.

6. Storm Water Pollution Prevention Plan Requirements

a. Description of potential pollutant sources. Under the description of potential pollutant sources in the storm water pollution prevention plan requirements, permittees are required to include storage areas for vehicles and equipment awaiting maintenance on their facility site map. EPA believes that this is appropriate since this area may potentially be a significant source of pollutants to storm water.

b. Measures and controls. Under the description of measures and controls in the storm water pollution prevention plan requirements, this section proposes that all areas that may contribute pollutants to storm waters discharges shall be maintained in a clean, orderly manner. This section also proposes that the following areas must be specifically addressed:

(1) Vehicle and equipment storage areas. The storage of vehicles and equipment awaiting maintenance must be confined to designated areas (delineated on the site map). The plan must describe measures that prevent or minimize contamination of the storm water runoff from these areas. The facility shall consider the use of drip pans under vehicles and equipment, indoor storage of the vehicles and equipment, installation of berming and diking of this area, use of absorbents, roofing or covering storage areas, cleaning pavement surface to remove oil and grease, or other equivalent methods.

(2) Fueling areas. The plan must describe measures that prevent or minimize contamination of the storm water runoff from fueling areas. The facility shall consider covering the fueling area, using spill and overflow protection and cleanup equipment, minimizing runoff of storm water to the fueling area, using dry cleanup methods, collecting the storm water runoff and providing treatment or recycling, or other equivalent measures.

(3) Material storage areas. Storage units of all materials (e.g., used oil, used oil filters, spent solvents, paint wastes, radiator fluids, transmission fluids,

hydraulic fluids) must be maintained in good condition, so as to prevent contamination of storm water, and plainly labeled (e.g., "used oil," "spent solvents," etc.). The plan must describe measures that prevent or minimize contamination of the storm water runoff from such storage areas. The facility shall consider indoor storage of the materials, installation of berming and diking of the area or other equivalent methods.

(4) Vehicle and equipment cleaning areas. The plan must describe measures that prevent or minimize contamination of the storm water runoff from all areas used for vehicle and equipment cleaning. The facility shall consider performing all cleaning operations indoors, covering the cleaning operation, ensuring that all washwaters drain to the intended collection system (i.e., not the storm water drainage system unless NPDES permitted), collecting the storm water runoff from the cleaning area and providing treatment or recycling, or other equivalent measures. The discharge of vehicle and equipment wash waters, including tank cleaning operations, are not authorized by this section and must be covered under a separate NPDES permit or discharged to a sanitary sewer in accordance with applicable industrial pretreatment requirements.

(5) Vehicle and equipment maintenance areas. The plan must describe measures that prevent or minimize contamination of the storm water runoff from all areas used for vehicle and equipment maintenance. The facility shall consider performing all maintenance activities indoors, using drip pans, maintaining an organized inventory of materials used in the shop, draining all parts of fluids prior to disposal, prohibiting the practice of hosing down the shop floor where the practice would result in the exposure of pollutants to storm water, using dry cleanup methods, collecting the storm water runoff from the maintenance area and providing treatment or recycling, or other equivalent measures.

(6) Locomotive sanding (loading sand for traction) areas. The plan must describe measures that prevent or minimize contamination of the storm water runoff from areas used for locomotive sanding (including locomotive sanding). The facility shall consider covering sanding areas, minimizing storm water runoff/runoff, appropriate sediment removal practices to minimize the offsite transport of sanding material by storm water, or other equivalent measures.

As documented earlier, these six areas are the common sources of pollutants in

storm water from vehicle and equipment cleaning and maintenance activities. Based upon the information provided in part 1 of the group application process, the suggested management measures are commonly used at ground transportation facilities. EPA believes that the incorporation of management practices such as those suggested, in conjunction with the baseline requirements, will substantially reduce the potential that these activities and areas will significantly contribute to the pollution of storm water discharges. In addition, EPA believes that these requirements continue to provide the necessary flexibility to address the variable risk for pollutants in storm water discharges associated with different facilities. Further, many facilities will find that management measures that they have already incorporated into the facility's operation, such as the installation of overfill protection equipment and labelling and maintenance of used oil storage units, that are already required under existing EPA programs will meet the requirements of this section.

Under the inspection requirements of the storm water pollution prevention plan elements, this section proposes that in addition to the comprehensive site evaluation required under Part XI of today's proposal, qualified facility personnel shall be identified to inspect designated equipment and areas of the facility, at a minimum, on a monthly basis. The following areas shall be included in all inspections: storage areas for vehicles and equipment awaiting maintenance, fueling areas, vehicle and equipment maintenance areas (both indoors and outdoors), material storage areas, vehicle and equipment cleaning areas, and loading and unloading areas. A set of tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections. Records of all inspections shall be maintained.

The purpose of the inspections is to check on the implementation of the storm water pollution prevention plan. The inspections allow facility personnel to monitor the success or failure of elements of the plan on a regular basis. The use of an inspection checklist is recommended. The checklist will ensure that all required areas are inspected, as well as help to meet the recordkeeping requirements.

Under the employee training component of the storm water pollution prevention plan requirements, the permittee is required to identify semiannual (twice per year) dates for such training. Employee training must,

at a minimum, address the following areas when applicable to a facility: Used oil management; spent solvent management; spill prevention and control; fueling procedures; general good housekeeping practices; proper painting procedures; and used battery management. Unlike some industrial operations, the industrial activities associated with vehicle and equipment maintenance that may affect storm water quality require the cooperation of all employees, not just one or two people. EPA, therefore, is proposing to require that employee training take place at least twice a year to serve as:

- (1) Training for new employees;
- (2) A refresher course for existing employees; and
- (3) Training for all employees on any storm water pollution prevention techniques recently incorporated into the plan.

7. Monitoring and Reporting Requirements

a. Monitoring requirements. The regulatory modifications at 40 CFR 122.44(i)(2) established on April 2, 1992, grant permit writers the flexibility to reduce monitoring requirements in storm water discharge permits. EPA has determined that the potential for storm water discharges to contain pollutants above benchmark levels, because of the industrial activities and materials exposed to precipitation, does not support sampling at facilities in this section of today's proposed permit. Based on a consideration of the BMPs typically used at these facilities, and generally low pollutant values from the application data, EPA believes that the pollution prevention plan with visual observations of storm water discharges will help to ensure storm water contamination is minimized. Because permittees are not required to conduct sampling, they will be able to focus their resources on developing and implementing the pollution prevention plan.

Quarterly visual inspections of a storm water discharge from each outfall are required at ground transportation facilities. The inspection must be of a grab sample collected from each storm water outfall. The examination of storm water grab samples shall include any observations of color, odor, turbidity, floating solids, foam, oil sheen, or other obvious indicators of storm water pollution. The inspection must be conducted in a well lit area. No analytical tests are required to be performed on these samples.

The examination must be made at least once in each designated period during daylight hours unless there is

insufficient rainfall or snow-melt to runoff. EPA expects that, whenever practicable, the same individual should carry out the collection and examination of discharges throughout the life of the permit to ensure the greatest degree of consistency possible. Examinations shall be conducted in each of the following periods for the purposes of inspecting storm water quality associated with storm water runoff and snow melt: December to February; March to May; June to August; September to November. Grab samples shall be collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 60 minutes) of when the runoff begins discharging. Reports of the visual observation include: the examination date and time, examination personnel, visual quality of the storm water discharge, and probable sources of any observed storm water contamination. The visual observation reports must be maintained onsite with the pollution prevention plan.

EPA believes that this quick and simple assessment will help the permittee to determine the effectiveness of his/her plan on a regular basis at very little cost. Although the visual examination cannot assess the chemical properties of the storm water discharged from the site, the examination will provide meaningful results upon which the facility may act quickly. The frequency of this visual inspection will also allow for timely adjustments to be made to the plan. If BMPs are performing ineffectively, corrective action must be implemented. A set of tracking or follow-up procedures must be used to ensure that appropriate actions are taken in response to the inspections. The visual examination is intended to be performed by members of the pollution prevention team. This hands-on inspection will enhance the staff's understanding of the storm water problems on that site and the effects of the management practices that are included in the plan.

When a discharger is unable to collect samples over the course of the monitoring period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

As discussed above, EPA does not believe that chemical monitoring is

necessary for facilities in this section of today's proposed permit. EPA believes that between quarterly visual inspections and site compliance evaluations potential sources of contaminants can be recognized, addressed, and then controlled with BMPs. In determining the monitoring requirements, EPA considered the nature of the industrial activities and significant materials exposed at these sites, and performed a review of data provided in Part 2 group applications.

8. Alternative Monitoring Requirements

EPA requests comment upon the following monitoring and reporting requirements in lieu of those listed in Part XI.P.5. of today's permit.

a. Annual monitoring requirements. During the period beginning on the effective date and lasting through the expiration date of this permit, permittees must monitor those storm water discharges identified below at least annually (1 time per year) except as provided in VI.E.7. (Sampling Waiver) and VI.E.6. (Representative Discharge). In addition to the parameters listed below, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event which generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

TABLE P-11—REQUIRED MONITORING PARAMETERS FOR STORM WATER DISCHARGES

| Parameter | Unit | Freq- quency | Sample type ¹ |
|---|----------------|-----------------|-----------------------------|
| Total Flow | Gal- lons. | 1/year | Esti- mate. |
| Oil and Grease | mg/L .. | 1/year | Grab. |
| Total Sus- pended Sol- ids (TSS). | mg/L .. | 1/year | Grab. |
| Chemical Oxy- gen Demand (COD). | mg/L .. | 1/year | Grab. |
| Surfactants (MBAS) ¹¹ . | mg/L .. | 1/year | Grab. |
| pH | Stand- ard. | 1/year | Grab. |

¹ The grab sample shall be collected in the first 30 minutes of the discharge or as soon thereafter as practical, but not to exceed 60 minutes.

¹¹ Required only for storm water discharges from vehicle or equipment cleaning areas.

b. Quarterly visual examination of storm water quality—(1) Facilities shall

perform and document a visual examination of storm water quality of each storm water discharge associated with industrial activity from vehicle and equipment maintenance activities and equipment cleaning operations. If the storm water from such operations flows such that there are numerous small points of discharge, one examination may be conducted as representative of the adjacent flows. The examination must be made at least once in each designated period (described in Part (2) below) during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(2) Examinations shall be conducted at least once in each of the following periods for the purposes of inspecting storm water quality associated with storm water runoff and snow melt: December to February (storm water runoff or snow melt); March to May (storm water runoff); June to August (storm water runoff); September to November (storm water runoff or snow melt).

(3) Examinations shall be conducted within the first 30 minutes (or as soon thereafter as practical, but not to exceed 60 minutes) of when the runoff begins discharging. The examinations shall include any observations of color, odor, turbidity, floating solids, foam, oil sheen, or other obvious indicators of storm water pollution. No analytical tests are required to be performed on these samples. Examinations shall be conducted so as to provide a reasonable representation of the nature of a typical storm water discharge at that site during that time of year.

(4) Information from the examination must be maintained onsite and must include: The examination date and time, examination personnel, visual quality of the storm water discharge, and probable sources of any observed storm water contamination. Based on information collected in the visual inspection the description of potential pollutant sources identified in the plan in accordance with Part XI.P.3.b.(2) (Description of Potential Pollutant Sources) of this permit and pollution prevention measures and controls identified in the plan in accordance with paragraph XI.P.3.b.(3) (Measures and Controls) of this permit shall be revised as appropriate within 2 weeks of such examination and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the evaluation. Records shall be kept for the entire permit term of such changes to the plan.

O. Storm Water Discharges Associated With Industrial Activity From Water Transportation Facilities That Have Vehicle Maintenance Shops and/or Equipment Cleaning Operations

1. Discharges Covered Under This Section

Special conditions have been developed for water transportation facilities that have vehicle and equipment maintenance shops (vehicle and equipment rehabilitation, mechanical repairs, painting, fueling, and lubrication) and equipment cleaning operations. Vehicle and equipment maintenance is a broad term used to include the following activities: vessel and equipment fluid changes, mechanical repairs, parts cleaning, sanding, blasting, welding, refinishing, painting, fueling, and storage of the related materials and waste materials, such as oil, fuel, batteries, or oil filters. Equipment cleaning operations include areas where vessel and vehicle exterior washdown takes place. The conditions proposed in this section apply to storm water discharges from vehicle and equipment maintenance shops or cleaning operations located at water transportation facilities covered under the storm water application regulations (40 CFR 122.26) and applying for coverage under today's proposed permit.

The storm water application regulations define storm water discharges associated with industrial activity at 40 CFR 122.26(b)(14). Category (viii) of this definition includes transportation facilities classified as Standard Industrial Classification (SIC) codes 40, 41, 42 (except 4221-25), 43, 44, 45, and 5171 that have vehicle and equipment maintenance shops, equipment cleaning operations, or airport deicing operations. The category further states that only those portions of the facility that are either involved in vehicle and equipment maintenance (including vehicle and equipment rehabilitation, mechanical repairs, painting, fueling, and lubrication), equipment cleaning operations, or airport deicing operations are associated with industrial activity. The conditions proposed in this section only apply to the water transportation facilities.

When an industrial facility, described by the above eligibility provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the

other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

If monitoring and pollution prevention plan requirements of another industrial activity section of this permit apply to co-located industrial activities at an industrial facility, the eligibility provisions of that industrial activity section shall not preclude the operator of the industrial facility from complying with the applicable monitoring and pollution prevention plan requirements of that section.

The facilities that would potentially be covered by this section of today's proposed permit may be assigned SIC code 44.

SIC code 44 includes facilities primarily engaged in furnishing water transportation services. The following types of facilities are examples of those covered under SIC code 44:

- Deep Sea Foreign Transportation of Freight (SIC 4412)
- Deep Sea Domestic Transportation of Freight (SIC 4424)
- Freight Transportation on the Great Lakes—St. Lawrence Seaway (SIC 4432)
- Water Transportation of Freight, Not Elsewhere Classified (SIC 4449).

Including:

- Canal barge operations
- Canal freight transportation
- Intracoastal freight transportation
- Lake freight transportation, except on the Great Lakes
- Log rafting and towing
- River freight transportation, except on the St. Lawrence Seaway
- Transportation of freight on bays and sounds of the oceans

- Deep Sea Transportation of Passengers, Except by Ferry (SIC 4481)
- Ferries (SIC 4482). Including:

- Car lighters (ferries)
- Railroad ferries

- Water Transportation of Passengers, Not Elsewhere Classified (SIC 4489).

Including:

- Airboats (swamp buggy rides)
- Excursion boat operations
- Passenger water transportation on rivers and canals
- Sightseeing boats
- Water Taxis

- Marine Cargo Handling (SIC 4491).

Including:

- Docks, including buildings and facilities

- Loading vessels
- Marine cargo handling
- Piers, including buildings and facilities
- Ship hold cleaning
- Stevedoring
- Unloading vessels
- Waterfront terminal operation
 - Towing and Tugboat Services (SIC 4492). Including:
 - Docking of ocean vessels
 - Shifting of floating equipment within harbors
 - Towing services, marine
 - Tugboat service
 - Undocking of ocean vessels
- Marinas (SIC 4493).¹²¹ Including:
 - Boat yards, storage and incidental repair
 - Yacht basins
 - Water Transportation Services, Not Elsewhere Classified (SIC 4499). Including:
 - Boat cleaning
 - Boat hiring, except pleasure
 - Boat livery, except pleasure
 - Boat rental, commercial
 - Canal operation
 - Cargo salvaging, from distressed vessels
 - Chartering of commercial boats
 - Dismantling ships
 - Lighterage
 - Marine railways for drydocks
- Marine salvaging
- Marine surveyors, except cargo
- Marine wrecking, ships for scrap
- Piloting vessels in and out of harbors
- Ship cleaning, except hold cleaning
- Ship registers: survey and classification of ships and marine equipment -
- Steamship leasing.

2. Pollutants Found in Storm Water Discharges

Table Q-1 lists potential pollutant source activities that commonly take place at water transportation vehicle maintenance and equipment cleaning operations.

TABLE Q-1.—INDUSTRIAL ACTIVITIES, POLLUTANT SOURCES, AND POLLUTANTS

| Activity | Pollutant source | Pollutant |
|---|---|---|
| Pressure Washing | Wash water | Paint solids, heavy metals, suspended solids. |
| Surface Preparation Paint Removal Sanding. | Sanding; mechanical grinding; abrasive blasting; paint stripping. | Spent abrasives, paint solids, heavy metals, solvents, dust. |
| Painting | Paint and paint thinner spills; spray painting; paint stripping; sanding; paint cleanup. | Paint solids, spent solvents, heavy metals, dust. |
| Engine Maintenance and Repairs. | Parts cleaning; waste disposal of greasy rags, used fluids, and batteries; use of cleaners & degreasers; fluid spills; fluid replacement. | Spent solvents, oil, heavy metals, ethylene glycol, acid/alkaline wastes, detergents. |
| Material Handling: Transfer Storage Disposal. | Fueling: spills; leaks; and hosing area | Fuel, oil, heavy metals. |
| | Liquid Storage in Above Ground Storage: spills and overfills; external corrosion; failure of piping systems. | Fuel, oil, heavy metals, material being stored. |
| | Waste Material Storage and Disposal: paint solids; solvents; trash; spent abrasives, petroleum products. | Paint solids, heavy metals, spent solvents, oil. |
| Shipboard Processes improperly discharged to storm sewer or into receiving water. | Process & cooling water; sanitary waste; bilge & ballast water. | Biochemical oxygen demand (BOD), bacteria, suspended solids, oil, fuel. |

Table Q-2 presents summary statistics on facilities primarily engaged in water transportation activities having vehicle maintenance and/or equipment cleaning operations.

¹²¹ "Guidelines for the Determination of Regulatory Status of Marinas and Related Operations." Facilities that are "primarily engaged" in operating marinas are best classified as SIC 4493—marinas. These facilities rent boat skips, store boats and generally perform a range of other marine services including boat cleaning and incidental boat repair. They frequently sell food, fuel, fishing supplies and may sell boats. For facilities classified as 4493 that are involved in

vehicle (vessel) maintenance activities (including vehicle rehabilitation, mechanical repairs, painting, fueling, and lubrication) or equipment cleaning operations, those portions of the facility that are involved in such vehicle maintenance activities are considered to be associated with industrial activity and are covered under the storm water regulations.

Facilities classified as 4493 that are not involved in equipment cleaning or vessel maintenance

activities (including vehicle rehabilitation, mechanical repairs, painting, and lubrication) are not intended to be covered under 40 CFR Section 122.26(b)(14)(viii) of the storm water permit application regulations. The retail sale of fuel alone at marinas, without any other vessel maintenance or equipment cleaning operations, is not considered to be grounds for coverage under the storm water regulations.

Table Q-2.—Statistics for Conventional Pollutants and Storm Water¹

[In mg/L unless otherwise indicated]

| Pollutant | Number of samples | | Mean | | Minimum | | Maximum | | Median | | 99th percentile | |
|----------------------------|-------------------|------|-------|------|---------|------|---------|--------|--------|------|-----------------|--------|

| Zinc | 4 | 3 | 0.7 | 0.4 | 0.1 | 0.2 | 2.2 | 0.9 | 0.2 | 0.2 | 2.2 | 0.9 |

¹ Mean, Maximum, Minimum, Median, and Percentiles include all detects and nondetects.² Composite samples.

Note: There is no information for 95th percentile columns.

EPA compared the data with the EPA, Office of Water Regulations and Standards, Criteria and Standards Division, "Quality Criteria for Water 1986," otherwise known as the "Gold Book Standards." As shown in Table Q-3, EPA found the following parameters to be of concern for Water Transportation Facilities which have repair and maintenance activities and/or equipment cleaning activities: oil & grease, chemical oxygen demand (COD), total suspended solids (TSS), pH, aluminum, iron, and zinc. In addition, part 2 data contained aluminum, iron,

and zinc concentrations which exceed toxic levels. The acute fresh water criteria and part 2 mean data are presented below in Table Q-3.

TABLE Q-3

| Pollutant | Acute fresh water criteria (mg/L) | Part 2 data mean (mg/L) |
|----------------|-----------------------------------|-------------------------|
| Aluminum | 0.750 | 3.12 |
| Iron | 1.0 | 26.68 |
| Zinc | 0.12 | 0.6775 |

3. Options for Controlling Pollutants

The measures commonly implemented to reduce pollutants in storm water associated with water transportation vehicle maintenance and/or equipment cleaning operations are generally simple to implement and are uncomplicated practices. Table Q-4 identifies Best Management Practices (BMPs) associated with different activities that routinely take place at water transportation facilities with vehicle maintenance and equipment cleaning operations.

TABLE Q-4.—INDUSTRIAL ACTIVITIES AND POTENTIAL BEST MANAGEMENT PRACTICES

| Activity | BMPs |
|--|--|
| Pressure washing | <p>Collect discharge water and remove all visible solids before discharging to a sewer system, or where permitted, to a drainage system, or receiving water.</p> <p>Perform pressure washing only in designated areas where wash water containment can be effectively achieved.</p> <p>Use no detergents or additives in the pressure wash water.</p> <p>Direct deck drainage to a collection system sump for settling and/or additional treatment.</p> <p>Implement diagonal trenches or berms and sumps to contain and collect wash water at marine railways.</p> <p>Use solid decking, gutters, and sumps at lift platforms to contain and collect wash water for possible reuse.</p> |
| Surface preparation, sanding, and paint removal. | <p>Enclose, cover, or contain blasting and sanding activities to the extent practical to prevent abrasives, dust, and paint chips from reaching storm sewers or receiving water.</p> <p>Where feasible, cover drains, trenches, and drainage channels to prevent entry of blasting debris to the system.</p> <p>Prohibit uncontained blasting or sanding activities performed over open water.</p> <p>Prohibit blasting or sanding activities performed during windy conditions which render containment ineffective.</p> <p>Inspect and clean sediment traps to ensure the interception and retention of solids prior to entering the drainage system.</p> <p>Sweep accessible areas of the drydock to remove debris and spent sandblasting material prior to flooding.</p> |
| Painting | <p>Collect spent abrasives routinely and store under a cover to await proper disposal</p> <p>Enclose, cover, or contain painting activities to the maximum extent practical to prevent overspray from reaching the receiving water.</p> <p>Prohibit uncontained spray painting activities over open water.</p> <p>Prohibit spray painting activities during windy conditions which render containment ineffective.</p> <p>Mix paints and solvents in designated areas away from drains, ditches, piers, and surface waters, preferably indoors or under cover.</p> |

TABLE Q-4.—INDUSTRIAL ACTIVITIES AND POTENTIAL BEST MANAGEMENT PRACTICES—Continued

| Activity | BMPs |
|---|--|
| Drydock maintenance | <p>Have absorbent and other cleanup items readily available for immediate cleanup of spills.</p> <p>Allow empty paint cans to dry before disposal.</p> <p>Keep paint and paint thinner away from traffic areas to avoid spills.</p> <p>Recycle paint, paint thinner, and solvents.</p> <p>Train employees on proper painting and spraying techniques, and use effective spray equipment that delivers more paint to the target and less overspray.</p> <p>Clean and maintain drydock on a regular basis to minimize the potential for pollutants in the storm water runoff.</p> <p>Sweep accessible areas of the drydock to remove debris and spent sandblasting material prior to flooding.</p> <p>If hosing must be used as a removal method, collect wash water to remove solids and potential metals.</p> <p>Clean the remaining areas of the dock after a vessel has been removed and the dock raised.</p> <p>Remove and properly dispose of floatable and other low-density waste (wood, plastic, insulations, etc.).</p> |
| Drydocking | <p>Use plastic barriers beneath the hull, between the hull and drydock walls for containment.</p> <p>Use plastic barriers hung from the flying bridge of the drydock, from the bow or stern of the vessel, or from temporary structures for containment.</p> <p>Weight the bottom edge of the containment tarpaulins or plastic sheeting during a light breeze.</p> <p>Use plywood and/or plastic sheeting to cover open areas between decks when sandblasting (scuppers, railings, freeing ports, ladders, and doorways).</p> <p>Install tie rings or cleats, cable suspension systems, or scaffolding to make implementation containment easier.</p> |
| Nondrydock containment | <p>Hang tarpaulin from the boat, fixed, or floating platforms to reduce pollutants transported by wind.</p> <p>Pave or tarp surfaces under marine railways.</p> <p>Clean railways before the incoming tide.</p> <p>Haul vessels beyond the high tide zone before work commences or halt work during high tide.</p> <p>Place plastic sheeting or tarpaulin underneath boats to contain and collect waste and spent materials and clean and sweep regularly to remove debris.</p> <p>Use fixed or floating platforms with appropriate plastic or tarpaulin barriers as work surfaces and for containment when work is performed on a vessel in the water to prevent blast material or paint overspray from contacting storm water or the receiving water.</p> |
| Engine maintenance and repairs | <p>Sweep, rather than hose, debris present on the dock.</p> <p>Maintain an organized inventory of materials used in the maintenance shop.</p> <p>Dispose of greasy rag, oil filters, air filters, batteries, spent coolant, and degreasers properly.</p> <p>Label and track the recycling of waste material (i.e., used oil, spent solvents, batteries).</p> <p>Drain oil filters before disposal or recycling.</p> <p>Store cracked batteries in a nonleaking secondary container.</p> <p>Promptly transfer used fluids to the proper container; do not leave full drip pans or other open containers around the shop. Empty and clean drip pans and containers.</p> <p>Do not pour liquid waste down floor drains, sinks, or outdoor storm drain inlets.</p> <p>Plug floor drains that are connected to the storm or sanitary sewer; if necessary, install a sump that is pumped regularly.</p> <p>Inspect the maintenance area regularly for proper implementation of control measures.</p> <p>Train employees on proper waste control and disposal procedures.</p> |
| Material Handling: Bulk liquid storage and containment. | <p>Store permanent tanks in a paved area surrounded by a dike system which provides sufficient containment for the larger of either 10 percent of the volume of all containers or 110 percent of the volume of the largest tank.</p> <p>Maintain good integrity of all storage tanks.</p> <p>Inspect storage tanks to detect potential leaks and perform preventive maintenance.</p> <p>Inspect piping systems (pipes, pumps, flanges, couplings, hoses, valves) for failures or leaks.</p> <p>Train employees on proper filling and transfer procedures.</p> |
| Material Handling: Containerized material storage. | <p>Store containerized materials (fuels, paints, solvents, etc.) in a protected, secure location and away from drains.</p> <p>Store reactive, ignitable, or flammable liquids in compliance with the local fire code.</p> <p>Identify potentially hazardous materials, their characteristics, and use.</p> <p>Control excessive purchasing, storage, and handling of potentially hazardous materials.</p> <p>Keep records to identify quantity, receipt date, service life, users, and disposal routes.</p> <p>Secure and carefully monitor hazardous materials to prevent theft, vandalism, and misuse of materials.</p> <p>Educate personnel for proper storage, use, cleanup, and disposal of materials.</p> <p>Provide sufficient containment for outdoor storage areas for the larger of either 10 percent of the volume of all containers or 110 percent of the volume of the largest tank.</p> <p>Use temporary containment where required by portable drip pans.</p> <p>Use spill troughs for drums with taps.</p> |
| Material Handling: Designated material mixing areas. | <p>Mix paints and solvents in designated areas away from drains, ditches, piers, and surface waters. Locate designated areas preferably indoors or under a shed.</p> |

TABLE Q-4.—INDUSTRIAL ACTIVITIES AND POTENTIAL BEST MANAGEMENT PRACTICES—Continued

| Activity | BMPs |
|---|--|
| Shipboard process water handling | <p>If spills occur,</p> <ul style="list-style-type: none"> • Stop the source of the spill immediately. • Contain the liquid until cleanup is complete. • Deploy oil containment booms if the spill may reach the water. • Cover the spill with absorbent material. • Keep the area well ventilated. • Dispose of cleanup materials properly. • Do not use emulsifier or dispersant. <p>Keep process and cooling water used aboard ships separate from sanitary wastes to minimize disposal costs for the sanitary wastes.</p> <p>Keep process and cooling water from contact with spent abrasives and paint to avoid discharging these pollutants.</p> <p>Inspect connecting hoses for leaks.</p> <p>Discharge sanitary wastes from the ship being repaired to the yard's sanitary system or dispose of by a commercial waste disposal company.</p> <p>Use appropriate material transfer procedures, including spill prevention and containment activities.</p> <p>Collect and dispose of bilge and ballast waters which contain oils, solvents, detergents, or other additives to a licensed waste disposal company.</p> |

4. Pollutant Control Measures Required Through Other EPA Programs

EPA recognizes that the Resource Conservation and Recovery Act (RCRA) and the Underground Storage Tank (UST) programs require careful management of materials used at Water Transportation Facilities and Boat Building & Repairing Facilities.

Under the RCRA program, on September 10, 1992, EPA promulgated standards in 40 CFR Part 279 for the management of used oils that are recycled (57 FR 41566). These standards include requirements for used oil generators, transporters, processors/refiners, and burners. The standards for used oil generators apply to all generators, regardless of the amount of used oil they generate. Do-it-yourself (DIY) generators which generate used oil from the maintenance of their personal vehicles, however, are not subject to the management standards (Section 279.20(a)(1)).

The requirements for used oil generators were designed to impose a minimal burden on generators while protecting human health and the environment from the risks associated with managing used oil. Under Subpart C of 40 CFR Part 279, used oil generators must not store used oil in units other than tanks, container, or units subject to regulation under Part 264 or 265 of 40 CFR (Section 279.22(a)). In other words, generators may store used oil in tanks or containers that are not subject to Subpart J (Hazardous Waste Tanks) or Subpart I (Containers) of Parts 264/265, as long as

such tanks or containers are maintained in compliance with the used oil management standards. This does not preclude generators from storing used oil in Subpart J tanks or Subpart I containers or other units, such as surface impoundments (Subpart K), that are subject to regulation under Part 264 or 265.

Storage units at generator facilities must be maintained in good condition and labeled with the words "used oil." Upon detection of a release of used oil to the environment, a generator must take steps to stop the release, contain the released used oil, and properly manage the released used oil and other materials (Section 279.22(b) to (d)). Generators storing used oil in underground storage tanks are subject to the UST regulations (40 CFR Part 280).

If used oil generators ship used oil offsite for recycling, they must use a transporter who has notified EPA and obtained an EPA identification number (Section 279.24).

The technical standards for USTs at 40 CFR Part 280 require that new UST systems (defined as systems for which installation commenced after December 12, 1988) use overfill prevention equipment that will: (1) Automatically shut off flow into the tank when the tank is no more than 95 percent full; or (2) alert the transfer operator when the tank is no more than 90 percent full by restricting the flow into the tank or triggering a high level alarm. The preceding requirements do not apply to systems that are filled by transfers of no more than 25 gallons at one time.

Existing UST systems (defined as systems for which installation has commenced on or before December 12, 1988) are required to have installed the described overfill prevention equipment by December 12, 1998.

5. Special Conditions

a. Prohibition of non-storm water discharges. Prohibited non-storm water discharges including bilge and ballast water, pressure wash water, sanitary wastes, and cooling water originating from vessels are not authorized by this section. The operators of such discharges must obtain coverage under a separate NPDES permit if discharged to waters of the U.S. or through a municipal separate storm sewer system.

This section does not authorize the non-storm water discharge of pressure wash water. Pressure washing is used to remove marine growth from vessels. EPA has found that unpermitted releases of pressure wash water is a habitual problem at water transportation facilities. Marine growths and paint debris found in the wash water can contain significant quantities of heavy metals, and this water cannot be discharged.

6. Storm Water Pollution Prevention Plan Requirements

The conditions that apply to water transportation facilities with vehicle maintenance and/or equipment cleaning operations build upon the requirements set forth in the baseline general permit for storm water discharges from

industrial activities which was finalized on September 9, 1992 (57 FR 41236).

Contents of the plan—(1) Description of potential pollutant sources—Under the description of potential pollutant sources in the storm water pollution prevention plan requirements, permittees are required to include the location(s) on their facility site map where engine maintenance and repair work, vessel maintenance and repair work, and pressure washing are performed. This requirement is the same as the baseline general permit of September 9, 1992, but here it is expressed in more appropriate terms for the water transportation industry. The baseline general permit includes "vehicle and equipment maintenance and/or cleaning areas." The location of "processing areas" at the facility included under the baseline general permit was replaced with the more specific language of painting, blasting, welding, and metal fabrication for this section. EPA believes that this specificity is appropriate for the water transportation industry and that these areas may potentially be a significant source of pollutants to storm water. Rather than requiring the location of "storage areas" as in the baseline general permit, this storm water pollution prevention plan specifies that the location of liquid storage areas (i.e., paint, solvents, resins) and material storage areas (i.e., blasting media, aluminum, steel) be shown. This again is the same requirement, but it is expressed in more specific terms for this industry.

(2) Measures and controls—Under the description of measures and controls in the storm water pollution prevention plan requirements, this section proposes that all areas that may contribute pollutants to storm waters discharges shall be maintained in a clean, orderly manner. This section also proposes that the following areas must be specifically addressed:

(a) Pressure washing area—When pressure washing is used to remove marine growth from vessels, the discharge water must be permitted by an NPDES permit. The plan must describe the measures to collect or contain the discharge from the pressure washing area, detail the method for the removal of the visible solids, describe the method of disposal of the collected solids, and identify where the discharge will be released (i.e., the receiving waterbody, storm sewer system, sanitary sewer system).

(b) Blasting and painting areas—The facility must consider containing all blasting and painting activities to prevent abrasives, paint chips, and

overspray from reaching the receiving water or the storm sewer system. The plan must describe measures taken at the facility to prevent or minimize the discharge of spent abrasive, paint chips, and paint into the receiving waterbody and storm sewer system. The facility may consider hanging plastic barriers or tarpaulins during blasting or painting operations to contain debris. Where required, a schedule for cleaning storm systems to remove deposits of abrasive blasting debris and paint chips should be addressed within the plan. The plan should include any standard operating practices with regard to blasting and painting activities. Such included items may be the prohibition of performing uncontained blasting and painting over open water or blasting and painting during windy conditions which can render containment ineffective.

(c) Material storage areas—All stored and containerized materials (fuels, paints, solvents, waste oil, antifreeze, batteries) must be stored in a protected, secure location away from drains and plainly labeled. The plan must describe measures that prevent or minimize contamination of the storm water runoff from such storage areas. The facility must specify which materials are stored indoors and consider containment or enclosure for materials that are stored outdoors. Above ground storage tanks, drums, and barrels permanently stored outside must be delineated on the site map with a description of the containment measures in place to prevent leaks and spills. The facility must consider implementing an inventory control plan to prevent excessive purchasing, storage, and handling of potentially hazardous materials. Those facilities where abrasive blasting is performed must specifically include a discussion on the storage and disposal of spent abrasive materials generated at the facility.

(d) Engine maintenance and repair areas—The plan must describe measures that prevent or minimize contamination of the storm water runoff from all areas used for engine maintenance and repair. The facility may consider performing all maintenance activities indoors, maintaining an organized inventory of materials used in the shop, draining all parts of fluids prior to disposal, prohibiting the practice of hosing down the shop floor, using dry cleanup methods, and/or collecting the storm water runoff from the maintenance area and providing treatment or recycling.

(e) Material handling areas—The plan must describe measures that prevent or minimize contamination of the storm water runoff from material handling

operations and areas (i.e., fueling, paint & solvent mixing, disposal of process wastewater streams from vessels). The facility may consider covering fueling areas; using spill and overflow protection; mixing paints and solvents in a designated area, preferably indoors or under a shed; and minimizing runoff of storm water to material handling areas. Where applicable, the plan must address the replacement or repair of leaking connections, valves, pipes, hoses, and soil chutes carrying wastewater from vessels.

(f) Drydock activities—The plan must address the routine maintenance and cleaning of the drydock to minimize the potential for pollutants in the storm water runoff. The plan must describe the procedures for cleaning the accessible areas of the drydock prior to flooding and final cleanup after the vessel is removed and the dock is raised. Cleanup procedures for oil, grease, or fuel spills occurring on the drydock must also be included within the plan. The facility should consider items such as sweeping rather than hosing off debris and spent blasting material from the accessible areas of the drydock prior to flooding and having absorbent materials and oil containment booms readily available to contain and cleanup any spills.

(g) General yard area—The plan must include a schedule for routine yard maintenance and cleanup. Scrap metal, wood, plastic, miscellaneous trash, paper, glass, industrial scrap, insulation, welding rods, packaging, etc., must be routinely removed from the general yard area. The facility may consider such measures as providing covered trash receptacles in each yard, on each pier, and on board each vessel being repaired.

These seven areas are the common sources of pollutants in storm water runoff from water transportation facilities which have vehicle maintenance and/or equipment cleaning activities. Based upon the September 1992 "Best Management Practices for the Shipbuilding and Repair Industry and for Bridge Maintenance Activities" prepared by the College of Engineering at the University of South Alabama, the suggested management measures are commonly used at water transportation facilities. EPA believes that the incorporation of management practices such as those suggested will substantially reduce the potential that these activities and areas will significantly contribute to the pollution of storm water discharges. In addition, EPA believes that these requirements continue to provide the necessary flexibility to address the variable risk for pollutants in storm water discharges

associated with different facilities. Further, many facilities will find that management measures that they have already incorporated into the facility's operation, such as the installation of overfill protection equipment and labelling and maintenance of used oil storage units, that are already required under existing EPA programs will meet the requirements of this section.

Under the preventive maintenance requirements of the storm water pollution prevention plan elements, the plan specifically includes the routine inspection of sediment traps to ensure that spent abrasives, paint chips, and solids will be intercepted and retained prior to entering the storm drainage system. Because of the nature of operations such as abrasive blasting which occur at water transportation facilities, specific routine attention needs to be placed on the collection and proper disposal of spent abrasive materials, paint chips, and other solids.

Under the inspection requirements of the storm water pollution prevention plan elements, qualified facility personnel shall be identified to inspect designated equipment and areas of the facility, at a minimum, on a monthly basis. The following areas shall be included in all inspections: pressure washing area, blasting and painting areas, material storage areas, engine maintenance and repair areas, material handling areas, drydock area, and general yard area. A set of tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections. Records shall be maintained.

The purpose of the inspections is to check on the implementation of the storm water pollution prevention plan. The inspections allow facility personnel to monitor the success or failure of elements of the plan on a regular basis. The use of an inspection checklist is highly encouraged. The checklist will ensure that all required areas are inspected, as well as help to meet the recordkeeping requirements.

Under the employee training component of the storm water pollution prevention plan requirements, the permittee is required to identify at least semiannual (twice per year) dates for

such training. Employee training must, at a minimum address the following areas when applicable to a facility: used oil management; spent solvent management; proper disposal of spent abrasives; proper disposal of vessel wastewaters, spill prevention and control; fueling procedures; general good housekeeping practices; proper painting and blasting procedures; and used battery management. Employees, independent contractors, and customers must be informed about BMPs and be required to perform in accordance with these practices. The facility must consider posting easy to read descriptions or graphic depictions of BMPs and emergency phone numbers in the work areas. Unlike some industrial operations, the industrial activities associated with water transportation facilities that may affect storm water quality require the cooperation of all employees. EPA, therefore, is proposing to require that employee training take place at least twice a year to serve as: (1) training for new employees; (2) a refresher course for existing employees; (3) training for all employees on any storm water pollution prevention techniques recently incorporated into the plan; and (4) a forum for the facility to invite independent contractors and customers to inform them on pollution prevention procedures and requirements.

7. Monitoring and Reporting Requirements

a. Analytical monitoring requirements. EPA believes that water transportation facilities may reduce the level of pollutants in storm water runoff from their sites through the development and proper implementation of the storm water pollution prevention plan requirements discussed in today's proposed permit. In order to provide a tool for evaluating the effectiveness of the pollution prevention plan, the proposed permit requires water transportation facilities to collect and analyze samples of their storm water discharges for the pollutants listed in Table Q-5. The pollutants listed in Table Q-5 were found to be above benchmark levels for a significant portion of water transportation facilities

that submitted quantitative data in the group application process, or are believed to be present based upon the description of industrial activities and significant materials exposed. EPA is requiring monitoring after the pollution prevention plan has been implemented to ensure a reduction of pollutants is realized.

At a minimum, storm water discharges from water transportation facilities must be monitored quarterly during the second year of permit coverage. At the end of the second year of permit coverage, a facility must calculate the average concentration for each parameter listed in Table Q-5. If the permittee collects more than four samples in this period, then they must calculate an average concentration for each pollutant of concern for all samples analyzed.

TABLE Q-5.—INDUSTRY MONITORING REQUIREMENTS

| Pollutants of concern | Cut-off concentration (mg/L) |
|----------------------------------|------------------------------|
| Total Recoverable Aluminum | 0.75 |
| Total Recoverable Iron | 0.3 |
| Total Recoverable Lead | 0.0337 |
| Total Recoverable Zinc | 0.065 |
| Chemical Oxygen Demand | 65 |
| Total Suspended Solids | 100 |

If the average concentration for a parameter is less than or equal to the value listed in Table Q-5, then the permittee is not required to conduct quantitative analysis for that parameter during the fourth year of the permit. If, however, the average concentration for a parameter is greater than the cut-off concentration listed in Table Q-5, then the permittee is required to conduct quarterly monitoring for that parameter during the fourth year of permit coverage. Monitoring is not required during the first, third, and fifth year of the permit. The exclusion from monitoring in the fourth year of the permit is conditional on the facility maintaining industrial operations and BMPs that will ensure a quality of storm water discharges consistent with the average concentrations recorded during the second year of the permit.

TABLE Q-6.—SCHEDULE OF MONITORING

2nd Year of Permit Coverage

- Conduct quarterly monitoring.
- Calculate the average concentration for all parameters analyzed during this period.
- If average concentration is greater than the value listed in Table Q-5, then quarterly sampling is required during the fourth year of the permit.
- If average concentration is less than or equal to the value listed in Table Q-5, then no further sampling is required for that parameter.

TABLE Q-6.—SCHEDULE OF MONITORING—Continued

| | |
|-----------------------------------|--|
| 4th Year of Permit Coverage | <ul style="list-style-type: none"> • Conduct quarterly monitoring for any parameter where the average concentration in year 2 of the permit is greater than the value listed in Table Q-5. • If industrial activities or the pollution prevention plan have been altered such that storm water discharges may be adversely affected, quarterly monitoring is required for all parameters of concern. |
|-----------------------------------|--|

In cases where the average concentration of a parameter exceeds the cut-off concentration, EPA expects permittees to place special emphasis on methods for reducing the presence of those parameters in storm water discharges. Quarterly monitoring in the fourth year of the permit will reassess the effectiveness of the adjusted pollution prevention plan.

b. Alternative certification.

Throughout today's permit, EPA has proposed monitoring requirements for facilities which the Agency believes have the potential for contributing significant levels of pollutants to storm water discharges. The alternative described below is necessary to ensure that monitoring requirements are only imposed on those facilities that do, in fact, have storm water discharges containing pollutants at concentrations of concern. EPA has determined that if materials and activities are not exposed to storm water at the site, then the potential for pollutants to contaminate storm water discharges does not warrant monitoring.

Therefore, a discharger is not subject to the monitoring requirements of this Part provided the discharger makes a certification for a given outfall, on an annual basis, under penalty of law, signed in accordance with Part VII.G. (Signatory Requirements), that material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, industrial machinery or operations, significant materials from past industrial activity, that are located in areas of the facility that are within the drainage area of the outfall are not presently exposed to storm water and will not be exposed to storm water for the certification period. Such certification must be retained in the storm water pollution prevention plan and submitted to EPA in accordance with Part VI.E. of this permit.

c. Reporting requirements. Permittees are required to submit all monitoring results obtained during the second and fourth year of permit coverage within 3 months of the conclusion of each year. Such permittees must submit monitoring results on four separately signed Discharge Monitoring Report Forms to the Director. For facilities conducting monitoring beyond the

minimum quarterly requirements an additional Discharge Monitoring Report Form must be filed for each analysis.

d. Sample Type. All discharge data shall be reported for grab samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable. If storm water discharges associated with industrial activity commingle with process or nonprocess water, then where practicable permittees must attempt to sample the storm water discharge before it mixes with the non-storm water discharge.

EPA requests comments upon a condition of today's proposed permit that would require permittees who are unable to sample storm water discharges before they commingle with non-storm water discharges to sample the combined discharge both during dry and wet weather and submit both sets of data to the permitting authority.

e. Representative discharge. When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may test the effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluent. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the

drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

f. Monthly Visual Examination of Storm Water Quality. Monthly visual inspections of storm water discharges from each outfall are required at water transportation facilities. The inspection must be of a grab sample collected from each storm water outfall. The examination of storm water grab samples shall include any observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, or other obvious indicators of storm water pollution. The inspection must be conducted in a well lit area. No analytical tests are required to be performed on these samples.

The examination must be made at least once in each month of the permit during daylight unless there is insufficient rainfall or snow-melt to runoff. EPA expects that, whenever practicable, the same individual should carry out the collection and examination of discharges throughout the life of the permit to ensure the greatest degree of consistency possible. Grab samples shall be collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 60 minutes) of when the runoff begins discharging. Reports of the visual observation include: the examination date and time, examination personnel, visual quality of the storm water discharge, and probable sources of any observed storm water contamination. The visual observation reports must be maintained onsite with the pollution prevention plan.

When a discharger is unable to collect samples over the course of the monitoring period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

EPA believes that this quick and simple assessment will allow the permittee to approximate the

effectiveness of his/her plan on a regular basis at very little cost. Although the visual examination cannot assess the chemical properties of the storm water discharged from the site, the examination will provide meaningful results upon which the facility may act quickly. The frequency of this visual inspection will also allow for timely adjustments to be made to the plan. If BMPs are performing ineffectively, corrective action must be implemented. A set of tracking or follow-up procedures must be used to ensure that appropriate actions are taken in response to the inspections. The visual examination is intended to be

performed by members of the pollution prevention team. This hands-on inspection will enhance the staff's understanding of the storm water problems on that site and the effects of the management practices that are included in the plan.

8. Alternative Monitoring Requirements

EPA requests comment upon the following monitoring and reporting requirements in lieu of those listed in Part XI.Q.7. of today's proposed permit.

a. Storm water discharges. During the period beginning on the effective date and lasting through the expiration date of this permit, permittees must monitor all storm water discharges associated

with vehicle, equipment, or vessel maintenance or cleaning for those parameters identified in Table Q-7 at least annually (1 time per year) except as provided in VI.A. (Sampling Waiver and Representative Discharge). In addition to the parameters listed, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event which generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

TABLE Q-7.—STORM WATER DISCHARGE PARAMETERS

| Parameter | Unit | Frequency | Sample Type ¹ |
|--|----------------|--------------|--------------------------|
| Total Flow | MGD | 1/year | Estimate. |
| Oil & Grease | mg/L | 1/year | Grab. |
| Chemical Oxygen Demand (COD) | mg/L | 1/year | Grab. |
| Total Suspended Solids (TSS) | mg/L | 1/year | Grab. |
| pH | standard | 1/year | Grab. |
| Total Recoverable Aluminum | mg/L | 1/year | Grab. |
| Total Recoverable Iron | mg/L | 1/year | Grab. |
| Total Recoverable Zinc | mg/L | 1/year | Grab. |
| Acute whole effluent toxicity ² | | 1/year | Grab. |

¹ The grab. sample shall be collected in the first 30 minutes of the discharge of as soon thereafter as practical, but not to exceed 60 minutes.

² The acute whole effluent toxicity shall be performed in accordance with Part XI.Q.7.c. of this section.

b. Toxicity Testing—(1.) Test

Procedures (a) The permittee shall conduct acute 24-hour static toxicity tests on both an appropriate invertebrate and an appropriate fish (vertebrate) test species (EPA/600/4-90-027 Rev. 9/91, Section 6.1). Freshwater species must be used for discharges to freshwater bodies. Due to the nonsaline nature of rainwater, freshwater should also be used for discharges to estuarine, marine, or other naturally saline waterbodies.

(b) All test organisms, procedures and quality assurance criteria used shall be in accordance with "Methods for Measuring the Acute Toxicity of Effluents to Freshwater and Marine Organisms," EPA/600/4-90/027, or the most current edition. The control water used will be moderately hard water as described in EPA/600/4-90/027, Table 6, or the most current edition.

(c) Tests shall be conducted annually (once per year) on a grab sample of the discharge. Test shall be conducted using 100 percent effluent (no dilution) and a control consisting of synthetic dilution water. Results of all tests conducted with any species shall be reported according to EPA/600/4-90-27 (or the most current edition), Section 12, Report Preparation, and the report submitted to EPA with the Discharge

Monitoring Reports (DMRs). On the DMR, the permittee shall report "0" if there is no statistical difference between the control mortality and the effluent mortality for each dilution. If there is statistical difference (exhibits toxicity), the permittee shall report "1" on the DMR.

(2) If acute whole effluent toxicity (statistically significant difference between the 100 percent dilution and the control) is detected in the storm water discharges, the permittee shall review the storm water pollution prevention plan and make appropriate modifications to assist in identifying the sources of toxicity and to reduce the toxicity of their storm water discharges. A summary of the review and the resulting modifications shall be provided in the plan.

9. Cost Estimates

This section does not include numeric effluent limits. The BMPs described within this section are designed to prevent or minimize pollutants in the storm water runoff. Facilities choose and implement the BMPs which best fit site specific requirements. Because this section does not contain numeric effluent limits or requirements to implement specific, predetermined

BMPs, an economic achievable analysis is not required.

R. Storm Water Discharges Associated With Industrial Activity From Ship and Boat Building or Repairing Yards

1. Discharges Covered Under This Section

The storm water application regulations define storm water discharges associated with industrial activity at 40 CFR 122.26(b)(14). Category (ii) of this definition includes facilities commonly identified by Standard Industrial Classification (SIC) codes 24 (except 2434), 26 (except 265 and 267), 28 (except 283 and 285), 29, 311, 32 (except 323), 33, 3441, and 373. The conditions proposed in this section apply to those facilities that may be assigned SIC code 373.

SIC code 373 includes facilities primarily engaged in ship and boat building and repairing services. The following facilities are covered under SIC code 373:

- **Ship Building and Repairing (SIC code 3731)**—These are establishments primarily engaged in building and repairing ships, barges, and lighters, whether self-propelled or towed by other crafts. The industry also includes the conversion and alteration of ships and the manufacture of off-shore oil and gas well drilling and production platforms (whether or not self-propelled). Examples include building

and repairing of barges, cargo vessels, combat ships, crew boats, dredges, ferryboats, fishing vessels, lighthouse tenders, naval ships, offshore supply boats, passenger-cargo vessels, patrol boats, sailing vessels, towboats, trawlers, and tugboats.

- **Boat Building and Repairing (SIC code 3732)**—These facilities are primarily engaged in building and repairing boats. Examples include building and repairing of fiberglass boats, motor-boats, sailboats, rowboats, canoes, dinghies, dories, small fishing boats, houseboats, kayaks, lifeboats, pontoons, and skiffs.

When an industrial facility, described by the above eligibility provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention

plan section(s) of this permit (if any) are applicable to the facility.

If monitoring and pollution prevention plan requirements of another industrial activity section of this permit apply to co-located industrial activities at an industrial facility, the eligibility provisions of that industrial activity section shall not preclude the operator of the industrial facility from complying with the applicable monitoring and pollution prevention plan requirements of that section.

2. Pollutants Found in Storm Water Discharges

Special conditions have been developed for boat and ship building and repairing operations. Common activities at ship and boat yards include: vessel and equipment cleaning fluid changes, mechanical repairs, parts cleaning, sanding, blasting, welding, refinishing, painting, fueling, and storage of the related materials and waste materials, such as oil, fuel, batteries, or oil filters. All of these areas are potential sources of pollutants to storm water discharges. Table R-1 lists pollutants associated with activities that commonly take place at Ship Building and Repairing Facilities (SIC 3731) and Boat Building and Repairing Facilities (SIC 3732).

TABLE R-1.—COMMON POLLUTANT SOURCES AT SHIP AND BOAT BUILDING AND REPAIRING FACILITIES

| Activity | Pollutant source | Pollutant |
|---|---|---|
| Pressure Washing | Wash water | Paint solids, heavy metals, suspended solids. |
| Surface Preparation, Paint Removal, Sanding. | Sanding; mechanical grinding; abrasive blasting; paint stripping | Spent abrasives, paint solids, heavy metals, solvents, dust. |
| Painting | Paint and paint thinner spills; spray painting; paint stripping; sanding; paint cleanup. | Paint solids, spent solvents, heavy metals, dust. |
| Engine Maintenance and Repairs ... | Parts cleaning; waste disposal of greasy rags, used fluids, and batteries; use of cleaners and degreasers; fluid spills; fluid replacement. | Spent solvents, oil, heavy metals, ethylene glycol, acid/alkaline wastes, detergents. |
| Material Handling: Transfer Storage Disposal. | Fueling: spills; leaks; and hosing area | Fuel, oil, heavy metals. |
| | Liquid Storage in Above Ground Storage: spills and overfills; external corrosion; failure of piping systems. | Fuel, oil, heavy metals, material being stored. |
| | Waste Material Storage and Disposal: paint solids; solvents; trash; spent abrasives, petroleum products. | Paint solids, heavy metals, spent solvents, oil. |
| Shipboard Processes Improperly discharged to storm sewer or into receiving water. | Process and cooling water; sanitary waste; bilge and ballast water | Biochemical oxygen demand (BOD), bacteria, suspended solids, oil, fuel. |

University of South Alabama, College of Engineering. September 1992. "Best Management Practices for the Shipbuilding and Repair Industry and for Bridge Maintenance Activities." College of Engineering Report No. 92-2.

Part 2 data revealed that boat repair facilities that have repair and maintenance activities exposed to storm water (including engine repair and maintenance, vessel repair and maintenance, painting, blasting, sanding and welding) and boat building facilities which have building activities exposed to storm water (including cutting, routing, forming, assembling, painting, varnishing, sanding and welding) have

mean and median pollutant concentrations at the levels of ship building and repair facilities.

Those boat building and repair facilities that have manufacturing and repair operations enclosed indoors show significantly lower levels in each reported parameter and are not required to monitor their storm water discharges under this section. Part 2 storm water data showed that these enclosed

facilities did not report data on metals. As required by 40 CFR 122.21(g)(ii) and (iii), group applicants were only required to sample for metals if the facility knew or had reason to believe it would be expected in the discharge.

Table R-2 presents summary statistics on facilities primarily engaged in boat and ship building and repair activities.

TABLE R-2.—STATISTICS FOR STORM WATER POLLUTANTS¹
[In mg/L unless otherwise indicated]

| Pollutant Sample Type | No. of Samples | | Mean | | Minimum | | Maximum | | Median | | 95th Percentile | | 99th Percentile | |

EPA compared the data with the EPA, Office of Water Regulations and Standards, Criteria and Standards Division, "Quality Criteria for Water 1986," otherwise known as the "Gold Book Standards." The monitoring requirements under this permit build upon those requirements set forth in the baseline general permit for storm water discharges from industrial activities

finalized on September 9, 1992 (57 FR 41236). EPA found the following parameters to be of concern for ship building and repair activities; boat repair activities that have repair and maintenance activities exposed to storm water (including engine repair and maintenance, vessel repair and maintenance, painting, blasting, sanding and welding); and boat building

activities that have building activities exposed to storm water (including cutting, routing, forming, assembling, painting, varnishing, sanding and welding); copper, lead, and zinc. In addition, part 2 data revealed copper, lead, and zinc concentrations which exceed toxic levels as presented in Table R-3. Table R-3.

COMPARISON OF PART 2 DATA WITH ACUTE FRESH WATER CRITERIA

| Pollutant | Acute fresh water criteria | Part 2 data mean |
|--------------|----------------------------|------------------|
| Copper | 0.018 mg/L | 0.046 mg/L |
| Lead | 0.082 mg/L | 1.49 mg/L |
| Zinc | 0.120 mg/L | 0.65 mg/L |

3. Options for Controlling Pollutants

The measures commonly implemented to reduce pollutants in

storm water discharges from boat and ship building and repairing facilities are generally uncomplicated and simple to implement. Table R-4 identifies Best

Management Practices (BMPs) associated with various activities that routinely occur at boat and ship building and repair facilities.

TABLE R-4.—COMMON MANAGEMENT PRACTICES FOR STORM WATER POLLUTION PREVENTION AT SHIP AND BOAT BUILDING AND REPAIRING FACILITIES

| Activity | BMPs |
|--|---|
| Pressure washing | Collect discharge water and remove all visible solids before discharging to a sewer system, or where permitted by an individual NPDES permit, to a drainage system, or receiving water. Perform pressure washing only in designated areas where wash water containment can be effectively achieved. Use no detergents or additives in the pressure wash water. Direct deck drainage to a collection system sump for settling and/or additional treatment. Implement diagonal trenches or berms and sumps to contain and collect wash water at marine railways. |
| Surface preparation, sanding, and paint removal. | Use solid decking, gutters, and sumps at lift platforms to contain and collect wash water for possible reuse. Enclose, cover, or contain blasting and sanding activities to the maximum extent practical to prevent abrasives, dust, and paint chips from reaching storm sewers or receiving water. Where feasible, cover drains, trenches, and drainage channels to prevent entry of blasting debris to the system. Prohibit uncontained blasting or sanding activities over open water. Prohibit blasting or sanding activities during windy conditions which render containment ineffective. Inspect and clean sediment traps to ensure the interception and retention of solids prior to entering the drainage system. |
| Painting | Sweep accessible areas of the drydock to remove debris and spent sandblasting material prior to flooding. Collect spent abrasives routinely and store under a cover to await proper disposal. Enclose, cover, or contain painting activities to the maximum extent practical to prevent overspray from reaching the receiving water. Prohibit uncontained spray painting activities over open water. Prohibit spray painting activities during windy conditions which render containment ineffective. Mix paints and solvents in designated areas away from drains, ditches, piers, and surface waters, preferably indoors or under a shed. Have absorbent and other cleanup items readily available for immediate cleanup of spills. Allow empty paint cans to dry before disposal. Keep paint and paint thinner away from traffic areas to avoid spills. Recycle paint, paint thinner, and solvents. Train employees on proper painting and spraying techniques, and use effective spray equipment that delivers more paint to the target and less overspray. |
| Drydock maintenance .. | Clean and maintain drydock on a regular basis to minimize the potential for pollutants in the storm water runoff. Sweep accessible areas of the drydock to remove debris and spent sandblasting material prior to flooding. If hosing must be used as a removal method, collect wash water to remove solids and potential metals. Clean the remaining areas of the dock after a vessel has been removed and the dock raised. |
| Drydock activities | Remove and properly dispose of floatable and other low-density waste (wood, plastic, insulations, etc.). Use plastic barriers beneath the hull, between the hull and drydock walls for containment. Use plastic barriers hung from the flying bridge of the drydock, from the bow or stern of the vessel, or from temporary structures for containment. Weight the bottom edge of the containment tarpaulins or plastic sheeting during a light breeze. Use plywood and/or plastic sheeting to cover open areas between decks when sandblasting (scuppers, railings, freeing ports, ladders, and doorways). |
| Nondrydock activities ... | Install tie rings or cleats, cable suspension systems, or scaffolding to make implementation containment easier. Hang tarpaulin from the boat, fixed, or floating platforms to reduce pollutants transported by wind. Pave or tarp surfaces under marine railways. |

TABLE R-4.—COMMON MANAGEMENT PRACTICES FOR STORM WATER POLLUTION PREVENTION AT SHIP AND BOAT BUILDING AND REPAIRING FACILITIES—Continued

| Activity | BMPs |
|--|--|
| Engine maintenance and repairs. | <p>Clean railways before the incoming tide.</p> <p>Haul vessels beyond the high tide zone before work commences or halt work during high tide.</p> <p>Place plastic sheeting or tarpaulin underneath boats to contain and collect waste and spent materials and clean and sweep regularly to remove debris.</p> <p>Use fixed or floating platforms with appropriate plastic or tarpaulin barriers as work surfaces and for containment when work is performed on a vessel in the water to prevent blast material or paint overspray from contacting storm water or the receiving water.</p> <p>Sweep rather than hose debris present on the dock.</p> <p>Maintain an organized inventory of materials used in the maintenance shop.</p> <p>Dispose of greasy rag, oil filters, air filters, batteries, spent coolant, and degreasers properly.</p> <p>Label and track the recycling of waste material (i.e., used oil, spent solvents, batteries).</p> <p>Drain oil filters before disposal or recycling.</p> <p>Store cracked batteries in a nonleaking secondary container.</p> <p>Promptly transfer used fluids to the proper container; do not leave full drip pans or other open containers around the shop. Empty and clean drip pans and containers.</p> <p>Do not pour liquid waste down floor drains, sinks, or outdoor storm drain inlets.</p> <p>Plug floor drains that are connected to the storm or sanitary sewer; if necessary, install a sump that is pumped regularly.</p> <p>Inspect the maintenance area regularly for proper implementation of control measures.</p> <p>Train employees on proper waste control and disposal procedures.</p> |
| Material Handling | Store permanent tanks in a paved area surrounded by a dike system which provides sufficient containment for the larger of either 10 percent of the volume of all containers or 110 percent of the volume of the largest tank. |
| Bulk liquid storage and containment. | Maintain good integrity of all storage tanks. |
| Material Handling Containerized material storage. | <p>Inspect storage tanks to detect potential leaks and perform preventive maintenance.</p> <p>Inspect piping systems (pipes, pumps, flanges, couplings, hoses, valves) for failures or leaks.</p> <p>Train employees on proper filling and transfer procedures.</p> <p>Store containerized materials (fuels, paints, solvents, etc.) in a protected, secure location and away from drains.</p> <p>Store reactive, ignitable, or flammable liquids in compliance with the local fire code.</p> |
| Material Handling | <p>Identify potentially hazardous materials, their characteristics, and use.</p> <p>Control excessive purchasing, storage, and handling of potentially hazardous materials.</p> <p>Keep records to identify quantity, receipt date, service life, users, and disposal routes.</p> <p>Secure and carefully monitor hazardous materials to prevent theft, vandalism, and misuse of materials.</p> <p>Educate personnel for proper storage, use, cleanup, and disposal of materials.</p> <p>Provide sufficient containment for outdoor storage areas for the larger of either 10 percent of the volume of all containers or 110 percent of the volume of the largest tank.</p> <p>Use temporary containment where required by portable drip pans.</p> <p>Use spill troughs for drums with taps.</p> |
| Designated material mixing areas. | <p>Mix paints and solvents in designated areas away from drains, ditches, piers, and surface waters. Locate designated areas preferably indoors or under a shed.</p> |
| Shipboard process water handling. | <p>If spills occur,</p> <ul style="list-style-type: none"> • Stop the source of the spill immediately. • Contain the liquid until cleanup is complete. • Deploy oil containment booms if the spill may reach the water. • Cover the spill with absorbent material. • Keep the area well ventilated. • Dispose of cleanup materials properly. • Do not use emulsifier or dispersant. <p>Keep process and cooling water used aboard ships separate from sanitary wastes to minimize disposal costs for the sanitary wastes.</p> |
| Shipboard sanitary waste disposal. | <p>Keep process and cooling water from contact with spent abrasives and paint to avoid pollution of the receiving water.</p> <p>Inspect connecting hoses for leaks.</p> <p>Discharge sanitary wastes from the ship being repaired to the yard's sanitary system or dispose of by a commercial waste disposal company.</p> |
| Bilge and Ballast water | <p>Use appropriate material transfer procedures, including spill prevention and containment activities.</p> <p>Collect and dispose of bilge and ballast waters which contain oils, solvents, detergents, or other additives to a licensed waste disposal company.</p> |

NPDES Storm Water Group Applications—Part 1. Received by EPA March 18, 1991 through December 31, 1992.

4. Pollutant Control Measures Required Through Other EPA Programs

EPA recognizes that the Resource Conservation and Recovery Act (RCRA) and the Underground Storage Tank (UST) programs require careful management of materials used at Ship Building and Repairing Facilities and Boat Building and Repairing Facilities.

Under the RCRA program, on September 10, 1992, EPA promulgated standards in 40 CFR part 279 for the management of used oils that are recycled (57 FR 41566). These standards include requirements for used oil generators, transporters, processors/refiners, and burners. The standards for used oil generators apply to all generators, regardless of the amount of used oil they generate. Do-it-yourself (DIY) generators which generate used oil from the maintenance of their personal vehicles, however, are not subject to the management standards (Subsection 279.20(a)(1)).

The requirements for used oil generators were designed to impose minimal burden on generators while protecting human health and the environment from the risks associated with managing used oil. Under Subpart C of 40 CFR part 279, used oil generators must not store used oil in units other than tanks, containers, or units subject to regulation under Part 264 or 265 of 40 CFR 279.22(a). In other words, generators may store used oil in tanks or containers that are not subject to Subpart J (Hazardous Waste Tanks) or Subpart I (Containers) of Parts 264/265, as long as such tanks or containers are maintained in compliance with the used oil management standards. This does not preclude generators from storing used oil in Subpart J tanks or Subpart I containers or other units, such as surface impoundments (Subpart K), that are subject to regulation under Part 264 or 265.

Storage units at generator facilities must be maintained in good condition and labeled with the words "used oil." Upon detection of a release of used oil to the environment, a generator must take steps to stop the release, contain the released used oil, and properly manage the released used oil and other materials (Sections 279.22 (b)-(d)). Generators storing used oil in underground storage tanks are subject to the UST regulations (40 CFR part 280).

If used oil generators ship used oil offsite for recycling, they must use a transporter who has notified EPA and obtained an EPA identification number (Section 279.24).

The technical standards for USTs at 40 CFR part 280 require that new UST

systems (defined as systems for which installation commenced after December 12, 1988) use overfill prevention equipment that will: (1) Automatically shut off flow into the tank when the tank is no more than 95 percent full; or (2) alert the transfer operator when the tank is no more than 90 percent full by restricting the flow into the tank or triggering a high level alarm. The preceding requirements do not apply to systems that are filled by transfers of no more than 25 gallons at one time. Existing UST systems (defined as systems for which installation has commenced on or before December 12, 1988) are required to have installed the described overfill prevention equipment by December 12, 1998.

5. Special Conditions

a. Prohibition of non-storm water discharges. This section of today's proposed permit does not authorize prohibited non-storm water discharges of wastewaters, such as bilge and ballast water, sanitary wastes, pressure washwater, and cooling water originating from vessels. The operators of such discharges must obtain coverage under a separate NPDES permit if discharged to waters of the U.S. or through a municipal separate storm sewer system.

6. Storm Water Pollution Prevention Plan Requirements

The conditions that apply to ship and boat building and repairing facilities build upon the requirements set forth in the baseline general permit for storm water discharges from industrial activities which was finalized on September 9, 1992 (57 FR 41236). The discussion which follows, therefore, only addresses conditions that differ from those required in the baseline permit.

a. Contents of the plan—(1) Description of potential pollutant sources. Under the description of potential pollutant sources in the storm water pollution prevention plan requirements, permittees are required to include the location(s) on their facility site map where engine maintenance and repair work, vessel maintenance and repair work, and pressure washing are performed. This requirement is the same as the baseline general permit, but here it is expressed in more appropriate terms for the ship and boat industry. Rather than requiring the location of "storage areas" as in the baseline general permit, this storm water pollution prevention plan specifies that the location of liquid storage areas (i.e., paint, solvents, resins) and material

storage areas (i.e., blasting media, aluminum, steel) be shown.

(2) Measures and controls. Under the description of measures and controls in the storm water pollution prevention plan requirements, this section proposes that all areas that may contribute pollutants to storm waters discharges shall be maintained in a clean and orderly manner. This section of today's proposed permit also proposes that the following areas be specifically addressed:

*(a) Pressure washing area—*When pressure washing is used to remove marine growth from vessels, the discharge water must be collected or contained and disposed of as required by the NPDES permit for this process water, if the discharge is to waters of the U.S. or through a municipal separate storm sewer. The plan must describe the measures to collect or contain the discharge from the pressure washing area, detail the method for the removal of the visible solids, describe the method of disposal of the collected solids, and identify where the discharge will be released (i.e., the receiving waterbody, storm sewer system, sanitary sewer system).

*(b) Blasting and painting areas—*To the maximum extent practical, all blasting and painting activities must be sufficiently contained to prevent abrasives, paint chips, and overspray from reaching a receiving waterbody or storm sewer system. The plan must describe measures taken at the facility to prevent or minimize the discharge of spent abrasive, paint chips, and paint into the receiving waterbody and storm sewer system. The facility may consider hanging plastic barriers or tarpaulins during blasting or painting operations to contain debris. Where required, a schedule for cleaning storm systems to remove deposits of abrasive blasting debris and paint chips should be addressed within the plan. The plan should include any standard operating practices with regard to blasting and painting activities. Such items may include the prohibition of performing uncontained blasting and painting over open water or blasting and painting during windy conditions which can render containment ineffective.

*(c) Material storage areas—*All stored and containerized materials (fuels, paints, solvents, waste oil, antifreeze, batteries) must be stored in a protected, secure location away from drains and plainly labeled. The plan must describe measures that prevent or minimize contamination of the storm water runoff from such storage areas. The facility must specify which materials are stored indoors and consider containment or

cover for materials that are stored outdoors. Above ground storage tanks, drums, and barrels permanently stored outside must be delineated on the site map with a description of the containment measures in place to prevent leaks and spills. The facility must consider implementing an inventory control plan to prevent excessive purchasing, storage, and handling of potentially hazardous materials. Those facilities where abrasive blasting is performed must specifically include within the plan discussion on the storage and proper disposal of spent abrasive generated at the facility.

(d) *Engine maintenance and repair areas*—The plan must describe measures that prevent or minimize contamination of the storm water runoff from all areas used for engine maintenance and repair. The facility must consider performing all maintenance activities indoors, maintaining an organized inventory of materials used in the shop, draining all parts of fluids prior to disposal, prohibiting the practice of hosing down the shop floor where the practice would result in the exposure of pollutants to storm water, using dry cleanup methods, and/or collecting the storm water runoff from the maintenance area and providing treatment or recycling.

(e) *Material handling areas*—The plan must describe measures that prevent or minimize contamination of the storm water runoff from material handling operations and areas (i.e., fueling, paint and solvent mixing, disposal of process wastewater streams from vessels). The facility must consider covering fueling areas; using spill and overflow protection; mixing paints and solvents in a designated area, preferably indoors or under a shed; and minimizing runoff of storm water to material handling areas. Where applicable, the plan must address the replacement or repair of leaking connections, valves, pipes, hoses, and soil chutes carrying wastewater from vessels.

(f) *Drydock activities*—The plan must address the routine maintenance and cleaning of the drydock to minimize the potential for pollutants in storm water runoff. The facility must describe the procedures for cleaning the accessible areas of the drydock prior to flooding and the final cleanup after the vessel is removed and the dock is raised. Cleanup procedures for oil, grease, or fuel spills occurring on the drydock must also be included within the plan. The facility must consider items such as sweeping rather than hosing off debris and spent blasting material from the accessible areas of the drydock prior to

flooding and having absorbent materials and oil containment booms readily available to contain and cleanup any spills.

(g) *General yard area*—The plan must include a schedule for routine yard maintenance and cleanup. Scrap metal, wood, plastic, miscellaneous trash, paper, glass, industrial scrap, insulation, welding rods, packaging, etc., must be routinely removed from the general yard area. The facility must consider such measures as providing covered trash receptacles in each yard, on each pier, and on board each vessel being repaired.

These seven areas are the common sources of pollutants in storm water from ship building and repairing and boat building and repairing activities. Based upon Best Management Practices for the Shipbuilding and Repair Industry and for Bridge Maintenance Activities prepared by the College of Engineering at the University of South Alabama, the suggested management measures are commonly used at ship and boat facilities. EPA believes that the incorporation of management practices such as those suggested will substantially reduce the potential for these activities and areas to contribute pollutants to storm water discharges. In addition, EPA believes that these requirements will continue to provide the necessary flexibility to address the variable risk for pollutants in storm water discharges associated with different facilities. Many facilities will find that appropriate management measures are already employed at the facility because they have been required under an existing EPA program.

The preventive maintenance requirements specifically include the routine inspection of sediment traps to ensure that spent abrasives, paint chips, and solids will be intercepted and retained prior to entering the storm drainage system. Because of the nature of operations occurring at ship and boat facilities, routine attention needs to be placed on the collection and proper disposal of spent abrasive, paint chips, and other solids.

In addition to the comprehensive site evaluation required under Part XI.R.3.a.(4) of today's proposed permit, qualified facility personnel shall be identified to inspect designated equipment and areas of the facility, at a minimum, on a monthly basis. The following areas shall be included in all inspections: pressure washing area, blasting and painting areas, material storage areas, engine maintenance and repair areas, material handling areas, drydock area, and general yard area. A set of tracking or follow-up procedures shall be used to ensure that appropriate

actions are taken in response to the inspections. Records shall be maintained.

The purpose of the inspections is to check on the implementation and effectiveness of the storm water pollution prevention plan. The inspections allow facility personnel to monitor the success or failure of elements of the plan on a regular basis. The use of an inspection checklist is encouraged. The checklist will ensure that all required areas are inspected, as well as help to meet the record keeping requirements.

The permittee is required to identify semiannual (twice per year) dates for employee training. Employee training must, at a minimum address the following areas when applicable to a facility: Used oil management; spent solvent management; proper disposal of spent abrasives; proper disposal of vessel wastewaters, spill prevention and control; fueling procedures; general good housekeeping practices; proper painting and blasting procedures; and used battery management. Employees, independent contractors, and customers must be informed about BMPs and be required to perform in accordance with these practices. The permittee is required to consider posting easy to read or graphic depictions of BMPs that are included in the plan as well as emergency phone numbers in the work areas. This practice will enhance employees understanding the pollutant control measures. Unlike some industrial operations, the industrial activities associated with ship and boat building and repair facilities that may affect storm water quality require the cooperation of all employees. EPA, therefore, is proposing to require that employee training take place at least twice a year to serve as:

- (1) Training for new employees;
- (2) A refresher course for existing employees;
- (3) Training for all employees on any storm water pollution prevention techniques recently incorporated into the plan; and
- (4) A forum for the facility to invite independent contractors and customers to inform them on pollution prevention procedures and requirements.

7. Numeric Effluent Limitation

There are no additional numeric effluent limitations beyond those described in Part VI. of this fact sheet.

8. Monitoring and Reporting Requirements

a. *Analytical monitoring requirements*. EPA believes that ship and boat building and repairing

facilities may reduce the level of pollutants in storm water runoff from their sites through the development and proper implementation of the storm water pollution prevention plan requirements discussed in today's proposed permit. In order to provide a tool for evaluating the effectiveness of the pollution prevention plan and to characterize the discharge for potential environmental impacts, the proposed permit requires ship and boat building and repairing facilities to collect and analyze samples of their storm water discharges for the pollutants listed in Table R-5. The pollutants listed in Table R-5 were found to be above benchmark levels for a significant portion of ship and boat building and repairing facilities that submitted quantitative data in the group application process, or are believed to be present based upon the description of industrial activities and significant materials exposed. Because these pollutants have been reported at benchmark levels from ship and boat building and repairing, EPA is requiring monitoring after the pollution prevention plan has been implemented to assess the effectiveness of the pollution prevention plan and to help ensure that a reduction of pollutants is realized.

At a minimum, storm water discharges from ship and boat building and repairing facilities must be monitored quarterly during the second year of permit coverage. At the end of the second year of permit coverage, a facility must calculate the average concentration for each parameter listed in Table R-5. If the permittee collects more than four samples in this period, then they must calculate an average concentration for each pollutant of concern for all samples analyzed.

TABLE R-5.—INDUSTRY MONITORING REQUIREMENTS

| Pollutants of concern | Cut-off concentration |
|--------------------------------|-----------------------|
| Total Recoverable Copper . | 0.009 mg/L |
| Total Recoverable Zinc | 0.65 mg/L |
| Total Recoverable Arsenic . | 0.000018 mg/L |
| Total Recoverable Iron | 0.3 mg/L |
| Total Recoverable Lead | 0.0337 mg/L |
| Nitrate+Nitrite as Nitrogen .. | 0.68 mg/L |

If the average concentration for a parameter is less than or equal to the value listed in Table R-5, then the permittee is not required to conduct quantitative analysis for that parameter during the fourth year of the permit. If, however, the average concentration for a parameter is greater than the cut-off concentration listed in Table R-5, then

the permittee is required to conduct quarterly monitoring for that parameter during the fourth year of permit coverage. Monitoring is not required during the first, third, and fifth year of the permit. The exclusion from monitoring in the fourth year of the permit is conditional on the facility maintaining industrial operations and BMPs that will ensure a quality of storm water discharges consistent with the average concentrations recorded during the second year of the permit.

TABLE R-6.—SCHEDULE OF MONITORING

| | |
|------------------------------|--|
| 2nd Year of Permit Coverage. | <ul style="list-style-type: none"> • Conduct quarterly monitoring. • Calculate the average concentration for all parameters analyzed during this period. • If average concentration is greater than the value listed in Table R-5, then quarterly sampling is required during the fourth year of the permit. • If average concentration is less than or equal to the value listed in Table R-5, then no further sampling is required for that parameter. |
| 4th Year of Permit Coverage. | <ul style="list-style-type: none"> • Conduct quarterly monitoring for any parameter where the average concentration in year 2 of the permit is greater than the value listed in Table R-5. • If industrial activities or the pollution prevention plan have been altered such that storm water discharges may be adversely affected, quarterly monitoring is required for all parameters of concern. |

In cases where the average concentration of a parameter exceeds the cut-off concentration, EPA expects permittees to place special emphasis on methods for reducing the presence of those parameters in storm water discharges. Quarterly monitoring in the fourth year of the permit will reassess the effectiveness of the adjusted pollution prevention plan.

b. Alternative certification.—Throughout today's permit, EPA has proposed monitoring requirements for facilities which the Agency believes have the potential for contributing significant levels of pollutants to storm water discharges. The alternative described below is necessary to ensure that monitoring requirements are only imposed on those facilities that do, in fact, have storm water discharges containing pollutants at concentrations of concern. EPA has determined that if materials and activities are

not exposed to storm water at the site, then the potential for pollutants to contaminate storm water discharges does not warrant monitoring.

Therefore, a discharger is not subject to the monitoring requirements of this Part provided the discharger makes a certification for a given outfall, on an annual basis, under penalty of law, signed in accordance with Part VII.C. (Signatory Requirements), that material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, industrial machinery or operations, significant materials from past industrial activity, or, in the case of airports, deicing activities, that are located in areas of the facility that are within the drainage area of the outfall are not presently exposed to storm water and will not be exposed to storm water for the certification period. Such certification must be retained in the storm water pollution prevention plan and submitted to EPA in accordance with Part VI of this permit.

c. Reporting requirements. Permittees are required to submit all monitoring results obtained during the second and fourth year of permit coverage within 3 months of the conclusion of each year. Such permittees must submit monitoring results on four separately signed Discharge Monitoring Report Forms to the Director. For facilities conducting monitoring beyond the minimum quarterly requirements an additional Discharge Monitoring Report Form must be filed for each analysis.

d. Sample type. All discharge data shall be reported for grab samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable. If storm water discharges associated with industrial activity commingle with process or nonprocess water, then where practicable permittees must attempt to sample the storm water discharge before it mixes with the non-storm water discharge.

EPA requests comments upon a condition of today's proposed permit that would require permittees who are unable to sample storm water discharges

before they commingle with non-storm water discharges to sample the combined discharge both during dry and wet weather and submit both sets of data to the permitting authority.

e. Representative discharge. When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may test the effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluent. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

f. Monthly visual examination of storm water quality. Monthly visual inspections of storm water discharges from each outfall are required at ship and boatbuilding or repair yard facilities. The inspection must be of a grab sample collected from each storm water outfall. The examination of storm water grab samples shall include any observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, or other obvious indicators of storm water pollution. The inspection must be conducted in a well lit area. No analytical tests are required to be performed on these samples.

The examination must be made at least once in each month of the permit during daylight unless there is insufficient rainfall or snow-melt to runoff. EPA expects that, whenever practicable, the same individual should carry out the collection and examination of discharges throughout the life of the permit to ensure the greatest degree of consistency possible. Grab samples shall be collected within the first 30 minutes

(or as soon thereafter as practical, but not to exceed 60 minutes) of when the runoff begins discharging. Reports of the visual observation include: the examination date and time, examination personnel, visual quality of the storm water discharge, and probable sources of any observed storm water contamination. The visual observation reports must be maintained onsite with the pollution prevention plan.

When a discharger is unable to collect samples over the course of the monitoring period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

EPA believes that this quick and simple assessment will allow the permittee to approximate the effectiveness of his/her plan on a regular basis at very little cost. Although the visual examination cannot assess the chemical properties of the storm water discharged from the site, the examination will provide meaningful results upon which the facility may act quickly. The frequency of this visual inspection will also allow for timely adjustments to be made to the plan. If BMPs are performing ineffectively, corrective action must be implemented. A set of tracking or follow-up procedures must be used to ensure that appropriate actions are taken in response to the inspections. The visual examination is intended to be performed by members of the pollution prevention team. This hands-on inspection will enhance the staff's understanding of the storm water problems on that site and the effects of the management practices that are included in the plan.

g. Baseline general permit variance. On September 9, 1992, and September 25, 1992, EPA published the Final NPDES General Permits for Storm Water Discharges Associated With Industrial Activity. These notices set out

requirements for semiannual monitoring for several parameters for discharges from ship and boat building and repair facilities. These notices specifically require that facilities with storm water discharges that are associated with ship and boat building and repair are required to monitor their storm water discharges for oil and grease, COD, TSS, and pH. Today's proposed permit contains different monitoring requirements. EPA requests comment upon the difference between the monitoring requirements set out for ship and boat building and repairing facilities in the September 1992 General Permits and those required in today's proposed permit.

9. Alternative Monitoring Requirements

EPA requests comment upon the following monitoring and reporting requirements in lieu of those listed in part IX.R.8 of today's proposed permit.

a. Storm water discharges. During the period beginning on the effective date and lasting through the expiration date of this permit, permittees with activities identified in paragraphs XI.R.9.a.(1) and XI.R.9.a.(2) must monitor storm water discharges associated with industrial activity for the parameters identified in Table R-7 at least annually (1 time per year) except as provided in VI.A. (Sampling Waiver and Representative Discharge). In addition to the parameters listed, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event which generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

(1) Storm water discharges from boat building (including cutting, routing, forming, assembling, painting, varnishing, sanding and welding) or boat repairing (including engine repair and maintenance, vessel repair and maintenance, painting, blasting, sanding and welding) activities that are exposed to storm water;¹²²

(2) Storm water discharges from ship building or repairing activities.¹²³

TABLE R-7.—STORM WATER DISCHARGE PARAMETERS

| Parameter | Unit | Frequency | Sample type ¹ |
|--------------|------|-----------|--------------------------|
| Total Flow | MGD | 1/year | Estimate. |
| Oil & Grease | mg/L | 1/year | Grab. |

¹²² According to the U.S. Coast Guard, a vessel 65 feet or greater in length is referred to as a ship, and a vessel smaller than 65 feet is a boat.

¹²³ According to the U.S. Coast Guard, a vessel 65 feet or greater in length is referred to as a ship, and a vessel smaller than 65 feet is a boat.

TABLE R-7.—STORM WATER DISCHARGE PARAMETERS—Continued

| Parameter | Unit | Frequency | Sample type ¹ |
|---|----------------|--------------|--------------------------|
| Chemical Oxygen Demand (COD) | mg/L | 1/year | Grab. |
| Total Suspended Solids (TSS) | mg/L | 1/year | Grab. |
| pH | standard | 1/year | Grab. |
| Total Recoverable Copper | mg/L | 1/year | Grab. |
| Total Recoverable Lead | mg/L | 1/year | Grab. |
| Total Recoverable Zinc | mg/L | 1/year | Grab. |
| Acute whole effluent toxicity ² | | 1/year | Grab. |
| Any pollutant limited in an effluent guideline to which the facility is subject | | 1/year | Grab. |

¹ The grab sample shall be collected in the first 30 minutes of the discharge or as soon thereafter as practical, but not to exceed 60 minutes.

² The acute whole effluent toxicity shall be performed in accordance with Part XI.R.9.b. of this section.

b. Toxicity testing—(1) Test

procedures—(a) The permittee shall conduct acute 24-hour static toxicity tests on both an appropriate invertebrate and an appropriate fish (vertebrate) test species (EPA/600/4-90-027 Rev. 9/91, Section 6.1). Freshwater species must be used for discharges to freshwater bodies. Due to the nonsaline nature of rainwater, freshwater should also be used for discharges to estuarine, marine, or other naturally saline waterbodies.

(b) All test organisms, procedures and quality assurance criteria used shall be in accordance with "Methods for Measuring the Acute Toxicity of Effluents to Freshwater and Marine Organisms," EPA/600/4-90/027, or the most current edition. The control water used will be moderately hard water as described in EPA/600/4-90/027, Table 6, or the most current edition.

(c) Tests shall be conducted annually (once per year) on a grab sample of the discharge. Test shall be conducted using 100 percent effluent (no dilution) and a control consisting of synthetic dilution water. Results of all tests conducted with any species shall be reported according to EPA/600/4-90-27 (or the most current edition), Section 12, Report Preparation, and the report submitted to EPA with the Discharge Monitoring Reports (DMRs). On the DMR, the permittee shall report "0" if there is no statistical difference between the control mortality and the effluent mortality for each dilution. If there is statistical difference (exhibits toxicity), the permittee shall report "1" on the DMR.

(2) If acute whole effluent toxicity (statistically significant difference between the 100 percent dilution and the control) is detected in the storm water discharges, the permittee shall review the storm water pollution prevention plan and make appropriate modifications to assist in identifying the sources of toxicity and to reduce the toxicity of their storm water discharges. A summary of the review and the

resulting modifications shall be provided in the plan.

10. Cost Estimates

This section which covers ship building and repairing facilities and boat building and repairing facilities, does not include numeric effluent limits. The BMPs described within this section are designed to prevent or minimize pollutants in the storm water runoff. Facilities choose and implement the BMPs which best fit site specific requirements. Because this section does not contain numeric effluent limits or requirements to implement specific, predetermined BMPs, an economic achievable analysis is not required.

S. Storm Water Discharges Associated With Industrial Activity From Vehicle Maintenance Areas, Equipment Cleaning Areas, or Deicing Areas Located at Air Transportation Facilities

1. Discharges Covered Under This Section

The storm water application regulations define "storm water discharges associated with industrial activity" in terms of eleven categories of industrial activities at 40 CFR 122.26(b)(14). Category (viii) of this definition includes transportation facilities classified as Standard Industrial Classifications (SIC) 40, 41, 42 (except 4221-25), 43, 44, 45 and 5171 that have vehicle and equipment maintenance shops, equipment cleaning operations, or airport deicing operations. The category further states that only those portions of the facility that are either involved in vehicle and equipment maintenance (including vehicle and equipment rehabilitation, mechanical repairs, painting, fueling, and lubrication), equipment cleaning operations, or airport deicing operations are associated with industrial activity. The conditions proposed in this section apply to facilities generally classified as SIC code 45 (airports, airport terminals and flying fields) which conduct the above described activities.

When an industrial facility, described by the above eligibility provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

If monitoring and pollution prevention plan requirements of another industrial activity section of this permit apply to co-located industrial activities at an industrial facility, the eligibility provisions of that industrial activity section shall not preclude the operator of the industrial facility from complying with the applicable monitoring and pollution prevention plan requirements of that section.

a. Responsible parties. Airports typically operate under a single management organization known as the airport "authority" which in most cases is a public agency. As the operator of the facility, the airport authority is responsible for applying for an NPDES storm water permit. Airline companies and fixed base operators (e.g., fueling companies and maintenance shops) that have contracts with the airport authority to conduct business on airport property are referred to as "tenants" of the airport. Operations conducted by tenants, if described as industrial activities at 40 CFR 122.26(b)(14)(viii), must be in compliance with the conditions of this section. As such, a storm water pollution prevention plan developed in accordance with the requirements of Part XI.S.3. shall be

prepared for areas occupied by tenants of the airport facility who conduct industrial activities as described in Part XI. of today's proposed permit. Plans developed for areas of the airport facility occupied by tenants of the airport shall be integrated into the storm water pollution prevention plan for the entire airport facility.

While the case could be made that each tenant is responsible for the discharge of pollutants in storm water runoff from their areas of operations, it is the operator of the facility, the airport authority, that is responsible for the storm water discharges from the site. Thus, the airport authority is responsible for developing a storm water pollution prevention plan for the airport facility as well as ensuring that the facility as a whole is in compliance with the conditions of this section.

2. Pollutants Found in Storm Water Discharges

In general, the quantitative data submitted thus far has not raised any particular areas of concern with respect to discharges of pollutants resulting from vehicle maintenance and/or deicing operations conducted at airport facilities. However, EPA believes that the part 2 sampling data does not provide justification that discharges resulting from deicing operations are not a significant source of pollutants. The sampling requirements for part 2 of the group application did not specify that facilities must sample storm water discharges from areas where deicing activities occur and/or during times when such operations were being conducted. As a result, only one facility indicated that the sampling data submitted was collected from areas where deicing activities were being conducted. After reviewing recent case studies on the effects of glycol discharges to receiving waters, EPA reports and the results of FAA surveys, EPA believes that additional information on the discharges of deicing chemicals to receiving waters as a result of aircraft and runway deicing operations is warranted and necessary.

Both ethylene and propylene glycols exert high oxygen demands when released into receiving waters. As such, this section requires that facilities report both the Biochemical Oxygen Demand (BOD) and Chemical Oxygen Demand (COD) of discharges sampled at facilities that use at least 100,000 gallons or more of glycol-based deicing chemicals. The concentration of nitrogen and possibly ammonia are the concern with respect to deicing operations where urea is used. Therefore, this section requires that facilities subject to the monitoring

requirements in Part XI.S.5. of the permit also report the concentration of Total Kjeldahl Nitrogen (TKN) in discharges sampled.

The results of the storm water survey conducted by FAA (June 1992) showed that 10 percent of the respondents who conduct deicing activities used more than 100,000 gallons of glycol based deicing chemicals during winter seasons. In addition, those facilities using more than 100,000 gallons of glycol based deicing chemicals accounted for 71 percent of the total amount of glycol based deicing chemicals reported in the survey. In a similar survey conducted by the American Association of Airport Executives, 4 percent of the airports conducting deicing activities used more than 100,000 gallons of ethylene glycol which represented approximately 76 percent of the total amount of ethylene glycol used by all airports surveyed.

3. Special Conditions

Today's proposed permit clarifies in Part XI.S.2. (Prohibition of Non-storm Water Discharges) that non-storm water discharges, including discharges from aircraft, ground vehicle and equipment washwaters, dry weather discharges from airport deicing/anti-icing operations, and dry weather discharges resulting from runway maintenance are not authorized under this section. The operators of such discharges must obtain coverage under a separate NPDES permit if discharged to waters of the U.S. or through a municipal separate storm sewer system. In a related requirement, the permittee is required to attach a copy of the NPDES permit issued for the discharge of non-storm water runoff or, if an NPDES permit has not yet been issued, a copy of the pending application to the plan. For facilities that discharge the waters mentioned above to a sanitary sewer system, the operator of the sanitary sewer system must be notified. A copy of the notification letter must be attached to the plan. If an industrial user permit has been issued under a pretreatment program, a copy of the permit must be attached to the plan as does any other permit to which the facility's discharge waters are subject.

4. Storm Water Pollution Prevention Plan Requirements

a. Contents of the plan. The pollution prevention plan requirements described below are in addition to those found under Part VI.C.

(1) *Description of potential pollutant sources.* In addition to the common pollution prevention plan requirements discussed in Part VI.C.2. (Drainage), the

site map developed for an entire airport facility shall identify and indicate the location of each tenant of the facility conducting industrial activities as described in this section.

In addition to the pollution prevention requirements discussed in Part VI.C.2. (Summary of Potential Pollutant Sources), airport facilities, including areas operated by tenants of the facility that conduct industrial activities, must address the following specific operations and areas where the operations occur:

- *Aircraft deicing*—Includes both deicing to remove frost, snow or ice, and anti-icing which prevents the accumulation of frost, snow or ice. Deicing of an airplane is accomplished through the application of a freezing point depressant fluid, commonly ethylene glycol or propylene glycol, to the exterior surface of an airplane. Both ethylene and propylene glycol have high biochemical oxygen demands (BOD) when discharged to receiving waters. Environmental impacts on surface waters due to glycol discharges includes glycol odors and glycol contaminated surface water and ground water systems, diminished dissolved oxygen levels and fish kills.

The Federal Aviation Administration (FAA) recently conducted a survey which focused on aircraft and runway deicing operations being conducted at U.S. airports. Ninety-six airports responded to the survey and results are summarized in a final report dated June 1, 1992. In summary, 65 airports indicated the amounts of ethylene glycol used for aircraft deicing for the winter periods of 1989-90 and 1990-91 and the volumes used by each airport ranged significantly, from a few gallons to 520,000 gallons. The average annual volume of ethylene glycol used by all respondents for the winter periods of 1989-90 and 1990-91 was approximately 2,159,426 gallons.

The majority of aircraft deicing operations occur on the apron adjacent to the passenger terminal and runoff generally drains to a nearby storm water inlet. In fact, 31 of the respondents to the FAA survey indicated that 75 percent or more of the spent deicing chemicals were discharged to the storm sewer system. In general, the remainder of spent chemical resulting from aircraft deicing operations drained to ditches or open areas.

All aspects of aircraft deicing/anti-icing operations, including quantities used and stored, as well as application, handling and storage procedures are required to be addressed under the conditions of this section.

• *Runway deicing/anti-icing*—Includes deicing/anti-icing operations conducted on runways, taxiways and ramps. Runway deicing/anti-icing commonly involves either the application of chemical fluids such as ethylene glycol or propylene glycol, or solid constituents such as pelletized urea. Urea has a high nitrogen content, therefore degradation of urea in a receiving water causes an increase in nutrient loadings resulting in an accelerated growth of algae and eutrophic conditions. Under certain ambient conditions, the degradation of urea in receiving waters can also result in ammonia concentrations toxic to aquatic life.

The FAA's storm water survey indicated that, of the facilities that indicated using urea for runway deicing for the winter periods of 1989–90 and 1990–91, the amount of urea used during a single winter period ranged from 100 pounds to 1,450,000 pounds (715 tons). With regard to disposal of spent deicing chemicals from runways, taxiways and ramps, 20 airports directly discharged 50 percent or more of runoff from deicing areas to storm sewers. In response to question concerning collection and treatment of spent deicing chemicals from runway deicing activities, sixty facilities responded and only five facilities indicated that runoff from runway deicing operations was collected and treated.

All aspects of runway deicing/anti-icing operations, including quantities used and stored, as well as application, handling and storage procedures are required to be addressed under the conditions of this section.

• *Aircraft servicing*—Typically conducted on the apron area adjacent to the passenger terminal, the servicing of aircraft could potentially contribute pollutants to storm water. As a result of spills or leaks during the servicing of airplanes, fluids such as engine oil, hydraulic fluid, fuel and lavatory waste could potentially enter the storm water system and/or be discharged to receiving waters. All spillage other than potable water should be prevented from entering the storm sewer system.

• *Aircraft, ground vehicle and equipment maintenance and washing*—Maintenance activities included in this section include both minor and major operations conducted either on the apron adjacent to the passenger terminal, or at dedicated maintenance facilities. Potential pollutant sources from all types of maintenance activities includes spills and leaks of engine oils, hydraulic fluids, transmission oil, radiator fluids, and chemical solvents used for parts cleaning. In addition the

disposal of waste parts, batteries, oil and fuel filters, and oily rags also have a potential for contaminating storm water runoff from maintenance areas unless proper management practices and operating procedures are implemented. The spent wash water from aircraft and ground vehicle washing activities could potentially be contaminated with surface dirt, metals, and fluids (fuel, hydraulic fluid, oil, lavatory waste).

• *Runway maintenance*—Over time, materials such as tire rubber, oil and grease, paint chips, and jet fuel can buildup on the surface of a runway causing a reduction in the friction of the pavement surface. When the friction level of the runway falls below a specific level, then maintenance on the runway must be performed. The Federal Aviation Administration (FAA) recommends several methods for removing rubber deposits and other contaminants from a runway surface including high pressure water, chemical solvents, high velocity particle impact, and mechanical grinding. If not properly managed, the materials removed from the runway surface could be discharged into nearby surface waters. Similarly, if chemical solvents are used in the maintenance operation, improper management practices could result in discharges of the chemical solvents in the storm water runoff from runway areas to nearby surface waters.

(2) *Measures and controls*. In addition to the common pollution prevention plan requirements discussed in Part VI.C.3. (Measures and Controls), this section specifies that permittees must address particular Best Management Practices (BMP) for specific areas and operations identified as potential sources of pollutants. This section further specifies that a schedule for implementation shall be provided for each BMP selected. The BMPs specified in this section are not intended to be the only alternative management practices considered by operators, simply the minimum to be considered. In most cases, the BMPs specified are common sense practices that are already in common practice at many airport facilities. As such, operators may only need to include the information in their storm water pollution prevention plan. Specific areas and industrial operations mentioned in this section and the corresponding BMPs for such areas are the following:

(a) *Aircraft, ground vehicle and equipment maintenance areas (including aircraft service areas)*—The plan must describe measures that prevent or minimize the contamination of storm water runoff from all areas used for aircraft, ground vehicle and

equipment maintenance and servicing. Management practices such as performing all maintenance activities indoors, maintaining an organized inventory of materials used, draining all parts of fluids prior to disposal, prohibiting the practice of hosing down the apron or hangar floor, using dry cleanup methods in the event of spills, and/or collecting the storm water runoff from maintenance and/or service areas and providing treatment, or recycling should be considered.

(b) *Aircraft, ground vehicle, and equipment cleaning areas*—The plan must describe measures that prevent or minimize the contamination of the storm water runoff from all areas used for aircraft, ground vehicle, and equipment maintenance. Management practices such as performing all cleaning operations indoors, and/or collecting the storm water runoff from the area and providing treatment or recycling should be considered.

(c) *Aircraft, ground vehicle, and equipment storage areas*—The storage of aircraft, ground vehicles, and equipment awaiting maintenance must be confined to designated areas (delineated on the site map). The plan must describe measures that prevent or minimize the contamination of storm water runoff from these areas. Management practices such as indoor storage of aircraft and ground vehicles, the use of drip pans for the collection of fluid leaks, and perimeter drains, dikes or berms surrounding storage areas should be considered.

(d) *Material storage areas*—Storage units of all materials (e.g., used oils, hydraulic fluids, spent solvents and waste aircraft fuel) must be maintained in good condition, so as to prevent contamination of storm water, and plainly labeled (e.g., "used oil," "Contaminated Jet-A," etc.). The plan must describe measures that prevent or minimize contamination of the storm water runoff from storage areas. Management practices such as indoor storage of materials, centralized storage areas for waste materials, and/or installation of berming and diking around storage areas should be considered for implementation.

(e) *Airport fuel system and fueling areas*—The plan must describe measures that prevent or minimize the discharge of fuels to the storm sewer resulting from fuel servicing activities or other operations conducted in support of the airport fuel system. Where the discharge of fuels into the storm sewer cannot be prevented, the plan shall indicate measures that will be employed to prevent or minimize the discharge of

the contaminated runoff into receiving surface waters.

(f) *Source reduction*—This section specifies that facilities which conduct aircraft and/or runway (including taxiways and ramps) deicing/anti-icing operations shall evaluate present operating procedures to consider alternative practices which would reduce the overall amount of deicing/anti-icing chemical used and/or lessen the environmental impact of the pollutant source.

With regard to runway deicing/anti-icing operations, operators should begin by evaluating present chemical application rates to ensure against excessive over application. Devices which meter the amount of chemical being applied to runways help to prevent over application. Operators should also emphasize anti-icing operations which would preclude the need to deice; less chemical is required to keep ice off a runway than is required to remove ice from a runway. To further assist in implementing anti-icing procedures, operators should also consider installing runway ice detection systems (RID) otherwise known as "pavement sensors" which monitor runway temperatures. Pavement sensors provide an indication of when runway temperatures are approaching freezing conditions, thus alerting operators of the need to anti-ice. Deicing chemicals applied during extremely cold, dry conditions, are often ineffective since they do not adhere to the ice surface and may be scattered as a result of windy conditions or aircraft movement. In an effort to improve the efficiency of the application, operators should consider pre-wetting the deicing chemical to improve the adhesion to the iced surface.

With regard to substitute deicing/anti-icing chemicals for runway use, operators should consider using chemicals which have less of an environmental impact on receiving waters. Potassium acetate, has a lower oxygen demand than glycol, is nontoxic to aquatic habitat or humans, and was approved by the FAA for runway deicing operations in November, 1991 (AC No. 150/5200-30A CHG 1).

In considering alternative management practices for aircraft deicing/anti-icing operations, operators should evaluate present application rates to ensure against excessive over application. In addition, operators may consider pretreating aircraft with hot water or forced air prior to the application of chemical deicer. The goal of this management practice is to reduce the amount of chemical deicer used during the operation. This management

practice alone is not sufficient since discharges of small concentrations of glycol can have significant effects on receiving waters. It is, however, an effective measure to reduce the amount of glycol needed per operation.

(g) *Management of runoff*—A number of reports developed for EPA (Guidance For Issuing NPDES Storm Water Permits For Airports, September 28, 1991) and Federal Aviation Administration (FAA) Advisory Circulars (AC 150-5320-15) indicate that the most common location for deicing/anti-icing aircraft at U.S. airports is along the apron areas where mobile deicing vehicles operate from gate to gate. In a recent FAA survey of deicing operations at U.S. airports (June 1992), the majority of respondents indicated that spent deicer chemicals from aircraft deicing operations either drain to the storm sewer system, open areas, or are left to evaporate on the ramp.

This section specifies that facilities shall provide a narrative description of BMPs to control or manage storm water runoff from areas where deicing/anti-icing operations occur in an effort to minimize or reduce the amount of pollutants being discharged from the site. For example, when deicing operations are conducted on aircraft during periods of dry weather, operators should ensure that storm water inlets are blocked to prevent the discharge of deicing chemical in the storm sewer system. Mechanical vacuum systems or other similar devices can then be used to collect the spent deicing chemical from the apron surface for proper disposal. Establishing a centralized deicing station would also provide better control over aircraft deicing operations in that it enables operators to readily collect spent deicing chemicals.

Once spent deicer chemicals are collected, operators can then select from various methods of disposal such as:

(i) *Disposal to sanitary sewage facility*—Because glycols are readily biodegradable, runoff can be treated along with sanitary sewage. The receiving treatment plant would, however, have to have the capacity to handle the hydraulic load as well as the additional biochemical oxygen demand associated with the deicing chemical. Measurements have shown that the average oxygen demand for glycol is between 400,000 and 600,000 mg O₂/L even if diluted per fluid manufacturers specifications (FAA AC 150-5320-15 CHG 1, 1991). To lessen both the increased hydraulic and pollutant loads due to runoff from airport deicing operations, retention basins may be located at the airport facility.

(ii) *Retention and detention ponds*—Conversion of suitable unused airport land into retention or detention basins allows for collection of large volumes of glycol waste from pavement surface runoff. The design capacity for such basins should at least handle surface runoffs for winter months noting the decreased microbial activity during the winter season which is needed for biodegradation, plus additional capacity for runoff during thawing periods. Continuous aeration would supply required oxygen and allow for faster biodegradation and release of glycol waste, which may reduce capacity requirements. Metering the discharge of flow from an onsite basin allows the operator to better control the rate of flow during peak flight hours and to avoid BOD shock loadings to a sanitary treatment facility or a surface water.

(iii) *Recycling*—Glycol recycling provides operators with a chemical cost savings since recaptured glycol can be sold or reused for other nonaircraft applications (FAA AC 150-5320-15, February 1991). Studies indicate that collected deicing chemicals which have glycol concentrations ranging from 15 to 25 percent can be cost effectively recycled. The optimal conditions for collecting the highest concentration of glycol in spent deicing fluid is directly from the apron or centralized deicing station when deicing operations are conducted during dry weather or light precipitation events. Deicing chemicals discharged to retention basins which are then allowed to mix with additional surface runoff typically result in glycol concentrations well below the acceptable range for recycling. There are, however, methods of physical separation presently available which increase the concentration of glycol and allow operators to recover a relatively reusable product.

(h) *Inspections*—In addition to the common pollution prevention plan requirements discussed in Part VI.C.3. (Inspections), airport authorities shall inspect (1) designated equipment and areas of the facility occupied by tenants who conduct industrial activities as described in this section on a quarterly basis, and (2) equipment and areas involved in deicing/anti-icing operations on a weekly basis during periods when deicing/anti-icing operations are being conducted.

(i) *Pollution prevention training*—Pollution Prevention training programs shall inform airport management and tenant personnel responsible for implementing activities identified in the storm water pollution prevention plan, as well as tenants of the airport facility, of the components and goals of the plan.

Training should address topics such as spill response, good housekeeping, material management practices and deicing procedures. The pollution prevention plan shall identify periodic dates for such training.

(3) *Comprehensive site compliance evaluation.* The storm water pollution prevention plan must describe the scope and content of comprehensive site inspections that qualified personnel will conduct to: (1) Confirm the accuracy of the description of potential pollution sources contained in the plan, (2) determine the effectiveness of the plan, and (3) assess compliance with the terms and conditions of today's proposed permit. Comprehensive site compliance evaluations must be conducted at least annually. The individual or individuals who will conduct the inspections must be identified in the plan and should be members of the pollution prevention team. Inspection reports must be retained.

Based on the results of each inspection, the description of potential pollution sources, and measures and controls, the plan must be revised as appropriate within 2 weeks after each inspection. Changes in the measures and controls must be implemented on the site in a timely manner, and never more than 12 weeks after completion of the inspection.

5. Numeric Effluent Limitation

There are no additional numerical limitations beyond those in Part VI.F. of this fact sheet.

6. Monitoring and Reporting Requirements

a. Analytical monitoring requirements. EPA believes that airports may reduce the level of pollutants in storm water runoff from their sites through the development and proper

implementation of the storm water pollution prevention plan requirements discussed in today's proposed permit. In order to provide a tool for evaluating the effectiveness of the pollution prevention plan and to characterize the discharge for potential environmental impacts, the proposed permit requires airport facilities that use 100,000 gallons or more of glycol-based deicing chemicals and/or 100 tons or more of urea on an average annual basis to collect and analyze samples of their storm water discharges from areas where deicing/anti-icing activities occur for the pollutants listed in Table S-1. The pollutants listed in Table S-1 were found to be above benchmark levels for a significant portion of airport facilities that use 100,000 gallons or more of glycol-based deicing chemicals and/or 100 tons or more of urea on an average annual basis that submitted quantitative data in the group application process, or are believed to be present based upon the description of industrial activities and significant materials exposed. Because these pollutants have been reported at benchmark levels from airport facilities that use 100,000 gallons or more of glycol-based deicing chemicals and/or 100 tons or more of urea on an average basis, EPA is requiring monitoring after the pollution prevention plan has been implemented to assess the effectiveness of the pollution prevention plan and to help ensure that a reduction of pollutants is realized.

At a minimum, storm water discharges from airport facilities that use 100,000 gallons or more of glycol-based deicing chemicals and/or 100 tons or more of urea on an average basis must be monitored four times during the second year of permit coverage when deicing/anti-icing activities are occurring and from outfalls that receive storm water runoff from those areas. At

the end of the second year of permit coverage, a facility must calculate the average concentration for each parameter listed in Table S-1. If the permittee collects more than four samples in this period, then they must calculate an average concentration for each pollutant of concern for all samples analyzed.

TABLE S-1.—INDUSTRY MONITORING REQUIREMENTS

| Pollutants of concern | Cut-off concentration |
|--|-----------------------|
| Biochemical Oxygen Demand (BOD ₅). | 9 mg/L |
| Chemical Oxygen Demand (COD). | 65 mg/L |
| Total Kjeldahl Nitrogen (TKN). | 1.50 mg/L |
| pH | 6.5 to 9 s.u. |

If the average concentration for a parameter is less than or equal to the value listed in Table S-1, then the permittee is not required to conduct quantitative analysis for that parameter during the fourth year of the permit. If, however, the average concentration for a parameter is greater than the cut-off concentration listed in Table S-1, then the permittee is required to conduct monitoring four times for that parameter while deicing operations are occurring in the fourth year of the permit. Monitoring is not required during the first, third, and fifth year of the permit. The exclusion from monitoring in the fourth year of the permit is conditional on the facility maintaining industrial operations and BMPs that will ensure a quality of storm water discharges consistent with the average concentrations recorded during the second year of the permit.

TABLE S-2.—SCHEDULE OF MONITORING

| | |
|-----------------------------------|--|
| 2nd Year of Permit Coverage | <ul style="list-style-type: none"> • Conduct quarterly monitoring. • Calculate the average concentration for all parameters analyzed during this period. • If average concentration is greater than the value listed in Table S-1, then quarterly sampling is required during the fourth year of the permit. • If average concentration is less than or equal to the value listed in Table S-1, then no further sampling is required for that parameter. |
| 4th Year of Permit Coverage | <ul style="list-style-type: none"> • Conduct quarterly monitoring for any parameter where the average concentration in year 2 of the permit is greater than the value listed in Table S-1. • If industrial activities or the pollution prevention plan have been altered such that storm water discharges may be adversely affected, quarterly monitoring is required for all parameters of concern. |

In cases where the average concentration of a parameter exceeds

the cut-off concentration, EPA expects permittees to place special emphasis on

methods for reducing the presence of those parameters in storm water

discharges. Quarterly monitoring in the fourth year of the permit will reassess the effectiveness of the adjusted pollution prevention plan.

b. Alternative certification.

Throughout today's permit, EPA has proposed monitoring requirements for facilities which the Agency believes have the potential for contributing significant levels of pollutants to storm water discharges. The alternative described below is necessary to ensure that monitoring requirements are only imposed on those facilities that do, in fact, have storm water discharges containing pollutants at concentrations of concern. EPA has determined that if materials and activities are not exposed to storm water at the site, then the potential for pollutants to contaminate storm water discharges does not warrant monitoring.

Therefore, a discharger is not subject to the monitoring requirements of this Part provided the discharger makes a certification for a given outfall, on an annual basis, under penalty of law, signed in accordance with Part VII.G. (Signatory Requirements), that material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, industrial machinery or operations, significant materials from past industrial activity, or, in the case of airports, deicing activities, that are located in areas of the facility that are within the drainage area of the outfall are not presently exposed to storm water and will not be exposed to storm water for the certification period. Such certification must be retained in the storm water pollution prevention plan and submitted to EPA in accordance with Part VI.C of this permit.

c. Reporting requirements. Permittees are required to submit all monitoring results obtained during the second and fourth year of permit coverage within 3 months of the conclusion of each year. Such permittees must submit monitoring results on four separately signed Discharge Monitoring Report Forms to the Director. For facilities conducting monitoring beyond the minimum quarterly requirements an additional Discharge Monitoring Report Form must be filed for each analysis.

d. Sample type. All discharge data shall be reported for grab samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab

sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable.

If storm water discharges associated with industrial activity commingle with process or nonprocess water, then where practicable permittees must attempt to sample the storm water discharge before it mixes with the non-storm water discharge.

EPA requests comments upon a condition of today's proposed permit that would require permittees who are unable to sample storm water discharges before they commingle with non-storm water discharges to sample the combined discharge both during dry and wet weather and submit both sets of data to the permitting authority.

e. Representative discharge. When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may test the effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluent. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

In determining if the airport is subject to the monitoring requirements, operators must determine the "average annual usage rate" of deicing/anti-icing chemicals at their particular facility. The "average annual usage rate" is determined by averaging the total amounts of deicing/anti-icing chemicals used at the facility in the 3 previous calendar years. The total amount of deicing chemicals used at an airport facility is the cumulative amount used by the airport authority and each tenant of the airport facility.

Airport facilities which use less than 100,000 gallons of glycol based deicing chemicals and/or less than 100 tons of urea on an average annual basis are not required to monitor discharges resulting

from deicing activities. The objective in establishing a minimum glycol usage cutoff from monitoring requirements is to prevent overly burdensome monitoring requirements on smaller airports that may use smaller amounts of deicing chemicals and do not have the operating budget to support monitoring and reporting requirements. In addition, a survey conducted by the American Association of Airport Executives (AAAE) of association members, revealed that airports which use less than 20,000 gallons of deicing chemicals account for less than 6 percent of the total amount of deicing chemicals used nationwide.

All facilities that conduct aircraft and/or runway deicing/anti-icing operations shall prepare estimates for annual pollutant loadings resulting from discharges of spent deicing chemicals from the facility. The loading estimates shall reflect the amounts of deicing chemicals discharged to separate storm sewer systems or surface waters, prior to and after implementation of the facility's storm water pollution prevention plan. The purpose of these estimates is to calculate the net reduction in deicing chemicals loadings to receiving streams. Such estimates shall be reviewed by a Registered Professional Engineer, and certified by such engineer. By means of the certification, the engineer, having examined the facility's, deicing procedures, and proposed control measures described in the storm water pollution prevention plan, shall attest that the loading estimates have been prepared in accordance with good engineering practices. Pollutant loading estimates developed during the life of the permit (before, during and after plan implementation) will enable the operator as well as the permitting authority to evaluate the effectiveness of control measures outlined in the facilities storm water pollution prevention plan in reducing or eliminating discharges of deicing chemical from the site.

f. Baseline general permit variance. On September 9, 1992, and September 25, 1992, EPA published the Final NPDES General Permits for Storm Water Discharges Associated With Industrial Activity. These notices set out requirements for semiannual monitoring for several parameters for discharges from airports with over 50,000 flights per year. These notices specifically require that facilities with storm water discharges that are associated with airports are required to monitor their storm water discharges from aircraft or airport deicing areas for oil and grease, BOD, COD, TSS, pH, and the primary

ingredient used in the deicing material. Today's proposed permit contains slightly different monitoring requirements. EPA requests comment upon the difference between the monitoring requirements set out for airports in the September 1992 General Permits and those required in today's proposed permit.

7. Alternative Monitoring Requirements

EPA requests comment upon the following monitoring and reporting requirements in lieu of those listed in Part XI.S.5. of today's proposed permit.

a. During the period beginning on the effective date and lasting through the expiration date of this permit, facilities which conduct aircraft and/or runway deicing/anti-icing operations and use:

(1) Less than 100,000 gallons of glycol based deicing chemicals and/or less than 100 tons of urea on an average annual basis, shall prepare annual pollutant loading estimates for discharges of spent deicing chemicals from the facility. The loading estimates shall reflect the amounts of deicing chemicals discharged to separate storm

sewer systems or surface waters, prior to and after implementation of the facility's storm water pollution prevention plan. Such estimates shall be reviewed by a Registered Professional Engineer, and certified by such engineer. By means of the certification, the engineer, having examined the facility's, deicing procedures, and proposed control measures described in the storm water pollution prevention plan, shall attest that the loading estimates have been prepared in accordance with good engineering practices. Certified loading estimates are to be retained at the airport facility and attached to the storm water pollution prevention plan.

(2) 20,000 gallons or more but less than 100,000 gallons of glycol based deicing chemicals and/or 25 tons or more but less than 100 tons of urea on an average annual basis, in addition to the complying with the requirements listed in part XI.S.7., shall monitor outfalls from the facility which collect runoff from areas where deicing/anti-icing activities occur at least once annually (1 time per year). Permittees

shall monitor such discharges when the highest concentration of deicing chemicals is expected to be discharged from the site.

(3) 100,000 gallons or more of glycol based deicing chemicals and/or 25 tons or more of urea on an average annual basis, shall monitor outfalls from the facility which collect runoff from areas where deicing/anti-icing activities occur. Such outfalls shall be monitored on a weekly basis during the months of December, January, and February as discharges containing deicing chemicals occur.

For the purposes of today's permit, the "average annual" usage rate of deicing/anti-icing chemicals is determined by averaging the amounts of deicing/anti-icing chemicals used at the facility in the 3 previous calendar years.

b. In addition to the parameters listed in Table S-3, the permittee shall provide the date the sample was taken; the amount (in gallons) of deicing/anti-icing chemicals used during the monitoring period; and an estimate of the total volume (in gallons) of the discharge sampled.

TABLE S-3.

| Parameter | Unit | Frequency | Sample |
|---|----------|-----------|--------|
| Biochemical Oxygen Demand (BOD ₅) | mg/L | Annual | Grab. |
| Chemical Oxygen Demand (COD) | mg/L | Annual | Grab. |
| Total Kjeldahl Nitrogen (TKN) | mg/L | Annual | Grab. |
| pH | Standard | Annual | Grab. |

c. *Sample type.* Data shall be reported for a Grab. sample.

d. *Reporting: when to submit—(1)*

Facilities identified in Parts XI.S.7.a. (2) and (3) are not required to submit monitoring results, unless required in writing by the Director. Monitoring results shall be recorded on Discharge Monitoring Report (DMR) form(s). DMR form(s) shall be retained with the pollution prevention plan.

This section of today's proposed permit requests public input on alternative strategies to the monitoring requirements discussed above. Alternatives, whether modifications to the proposed monitoring requirements or completely different approaches, should reflect the overall objectives of this section, mainly to evaluate the effectiveness of the storm water pollution prevention plan, and to characterize the pollutant loadings on receiving waters due to runoff from areas where deicing operations are conducted.

T. Storm Water Discharges Associated With Industrial Activity From Treatment Works

1. Discharges Covered Under This Section

On November 16, 1990 (55 FR 47990), the U.S. Environmental Protection Agency (EPA) promulgated the regulatory definition of "storm water discharges associated with industrial activity." This definition includes point source discharges of storm water from eleven categories of facilities, including " * * * (ix) treatment works treating domestic sewage or any other sewage sludge or wastewater treatment device or system, used in the storage, treatment, recycling, and reclamation of municipal or domestic sewage, including land dedicated to the disposal of sewage sludge that are located within the confines of the facility, with a design flow of 1.0 mgd or more or required to have an approved pretreatment program under 40 CFR part 403."

This section establishes special conditions for storm water discharges

associated with industrial activity from treatment works treating domestic sewage with a design flow of 1.0 mgd or more, or for treatment works that are required to have an approved pretreatment program under 40 CFR Part 403, or for those having land dedicated to the disposal of sewage sludge within the confines of the facility. Please note that storm water discharges from farm lands, domestic gardens, or lands used for sludge management where sludge is beneficially reused and which are not physically located in the confines of the facility, or areas that are in compliance with Section 405 of the Clean Water Act (CWA), are not currently regulated under the Federal storm water regulations.

When an industrial facility, described by the above eligibility provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the

other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

If monitoring and pollution prevention plan requirements of another industrial activity section of this permit apply to co-located industrial activities at an industrial facility, the eligibility provisions of that industrial activity section shall not preclude the operator of the industrial facility from complying with the applicable monitoring and pollution prevention plan requirements of that section.

2. Industry Profile

Wastewater treatment plants remove organic and inorganic contaminants from domestic sewage and sludge. This section provides a description of the treatment processes for reducing pollutants in domestic sewage. The operations are basically the same at all treatment plants and may be categorized by three general processes: primary treatment, secondary treatment, and tertiary treatment.

• **Primary Treatment**—The objective of primary treatment is the removal of suspended organic pollutants. This typically involves at least one of the following operations: screening, grit removal, and sedimentation. Chemical

processes, such as disinfection, may also occur during primary treatment operations.

• **Secondary Treatment**—The objective of secondary treatment is further removal of settleable solids and soluble organic matter. The operations employed during secondary treatment include biological oxidation via suspended growth or fixed film processes, such as activated sludge, rotating biological contractors or trickling filters.

• **Tertiary Treatment**—The objectives of tertiary treatment include further treatment of wastewater, such as removal of suspended solids by filtration; removal of nutrients, such as phosphorus and nitrogen, typically through chemical additions and biological processes, or by selective ion exchange; and further removal of pollutants through activated carbon treatment.

Prior to discharge into a receiving water body, treated wastewater is disinfected using chlorination followed by dechlorination. Sludge produced during primary and secondary treatment is commonly combined, thickened, stabilized, and then mechanically dewatered. Sludge is aerobically or anaerobically stabilized by adjusting the pH with lime. This is followed by dewatering process where a polymer is added to condition the sludge for dewatering. Sludge is often stored onsite in piles exposed to weather, until final disposal (e.g., surface disposal, or incineration). When sludge is to be land applied, sludge drying beds or

composting piles may be exposed to precipitation. In cases where sludge is incinerated onsite of the treatment plant, ash piles or impoundments may be exposed to precipitation.

3. Pollutants Found in Storm Water Discharges From Treatment Works

The impact of industrial activities at treatment works on storm water discharges will vary. Factors at a site which influence the water quality include geographic location, hydrogeology, the industrial activities exposed to storm water discharges, the facility's size, the types of pollution prevention measures/best management practices in place, and the type, duration, and intensity of storm events. Taken together or separately, these factors determine how polluted the storm water discharges will be at a given facility. For example, caustic soda may be significant source of pollutants at some facilities, while incinerator ash may be the primary pollutant source at others. Additionally, pollutant sources other than storm water, such as illicit connections, spills, and other improperly dumped materials, may increase the pollutant loading discharged into Waters of the United States.

Table T-1 lists industrial activities that commonly occur at treatment works, common pollutant sources at these facilities, and pollutants that are associated with these sources. Table T-1 identifies parameters as potential pollutants of concern associated with facilities covered by this section.

TABLE T-1.—DESCRIPTION OF INDUSTRIAL ACTIVITIES, POTENTIAL POLLUTANT SOURCES, AND POSSIBLE POLLUTANTS

| Activity | Pollutant source | Pollutant |
|---|--|---|
| Preparation of biological and physical treatment processes. | Spills and leaks of process chemicals .. | Disinfectants, polymers and coagulants, alum, ferric chloride, soda ash, lime, sodium aluminate, sodium hypochlorite, caustic soda. |
| Soil amending and grass fertilizing | Over fertilizing | Commercial brands of balance fertilizers (6-6-6, 8-8-8 or 12-12-12), commercial sludge based products, nitrogen, other nutrients, phosphorous, ammonia. |
| Liquid storage in above ground storage .. | External corrosion and structural failure Installation problems | Aluminum sulfate, liquid chlorine, liquid polymer, fuel, oil. Aluminum sulfate, liquid chlorine, liquid polymer, fuel, oil. |
| | Spills and overfills due to operator error Failure of piping systems (pipes, pumps, flanges, couplings, hoses, and valves). | Aluminum sulfate, liquid chlorine, liquid polymer, fuel, oil. Aluminum sulfate, liquid chlorine, liquid polymer, fuel, oil. |
| | Leaks or spills during pumping of liquids from barges, trucks, or rail cars to a storage facility. | Aluminum sulfate, liquid chlorine, liquid polymer, fuel, oil. |
| Pest control | Large quantities of pesticide application, pesticide storage. | Diazanone, malathion, amdro, dimethylphthalate, diethyl phthalate, dichlorvos, carbaryl, skeetal, batex, liquid copper. |
| Sludge drying beds | Sludge | Nitrate, TDS, TSS, ammonia. |
| Sludge storage piles | Sludge | Nitrate, TDS, TSS, ammonia. |
| Sludge transfer | Sludge, vehicles, transfer equipment | Nitrate, TDS, TSS, oil, fuel, hydraulic fluids, ammonia. |
| Incineration | Ash impoundments/piles | Heavy metals, TDS, TSS. |

TABLE T-1.—DESCRIPTION OF INDUSTRIAL ACTIVITIES, POTENTIAL POLLUTANT SOURCES, AND POSSIBLE POLLUTANTS—Continued

| Activity | Pollutant source | Pollutant |
|---------------------|---|--|
| Miscellaneous | Grit and scum piles from clarifiers, screens, exposed soil. | TSS, heavy metals, fecal coliform, nitrate, TSS. |

Part 2 group application data that was statistically summarized indicated large variations in the minimum and maximum values reported for each of the eight conventional pollutants monitored:

- Grab sample values for nitrate plus nitrite nitrogen ranged from 0.0 mg/L to 427 mg/L.

- Grab and flow weighted composite samples for BOD both ranged from 0.0 mg/L to 1300 mg/L.

- Oil and grease values ranged from 0.0 mg/L to 1210 mg/L.

- Grab sample values for Total Suspended Solids (TSS) ranged from 0.0 mg/L to 1836 mg/L, and flow-weighted composite sample values ranged from 3.0 mg/L to 844 mg/L.

The remaining conventional pollutants sampled also varied in their minimum and maximum values. However, the values were typically low relative to other sectors in today's proposed permit. EPA believes that Nitrate plus Nitrite Nitrogen and phosphorous are parameters of concern at treatment works. Less than 20 percent

of the sampling facilities reported fecal coliform above the most stringent storm water effluent guideline limitation, and therefore, EPA has concluded that fecal coliform is not a pollutant of concern at treatment works. Table T-2 indicates the sampling results for the conventional and toxic pollutants that were statistically analyzed by EPA. This table indicates the minimum and maximum values, means, medians, 99th percentiles, and the total number of samples analyzed for each of the conventional pollutants.

TABLE T-2.—STATISTICS FOR STORM WATER POLLUTANTS, MG/L FOR TREATMENT WORKS

| Pollutant | No. of Samples ¹ | Mean | Minimum | Maximum | Median | 98th Percentile |
|-------------------------------------|-----------------------------|-------------------|---------|---------|---------|-----------------|
| | | | | | | |
| Sample Type | Grab | Comp ^u | Grab | Comp | Grab | Comp |
| BOD ₅ | 90 | 89 | 33.26 | 46.11 | 1300.00 | 1300.00 |
| COD | 84 | 82 | 133.03 | 157.95 | 2000.00 | 2000.00 |
| Nitrate plus nitrite nitrogen | 84 | 83 | 20.88 | 20.50 | 396.78 | 396.78 |
| Nitrogen, total kjeldahl | 79 | 78 | 8.10 | 4.74 | 150.00 | 150.00 |
| Oil & grease | 89 | N/A | 24.24 | N/A | N/A | N/A |
| pH | 82 | N/A | N/A | N/A | 8.85 | 8.85 |
| Total phosphorus | 86 | 84 | 0.95 | 0.88 | 0.500 | 0.500 |
| Total suspended solids | 90 | 88 | 160.17 | 114.44 | 68.100 | 68.100 |
| Ammonia | 25 | 25 | 1.162 | 1.252 | 6.1 | 6.1 |
| Copper | 27 | 26 | 0.072 | 0.053 | 0.78 | 0.78 |

| Zinc | 22 | 21 | 0.238 | 0.12 | 1.4 | 1.4 |

¹ The number of samples reported include only those samples that were not reported as a nondetect or at the detection limit of the methodology.^u Composite samples.

4. Options for Controlling Pollutants

Part 1 group application data indicate that BMPs have not been widely implemented at the representative sampling facilities. Less than 3 percent of the sampling subgroup reported that

they cover loading areas, storage areas, or material handling areas; approximately 10 percent reported that they use containment; less than 4 percent of the representative facilities use concrete pads. The most commonly

listed (approximately 15 percent) material management practice is catch basins. Because BMPs described in part 1 data are limited, the following table is provided to identify BMPs associated with activities that routinely occur at treatment works.

TABLE T-3.—GENERAL STORM WATER BMPs FOR TREATMENT WORKS

| Activity | BMPs |
|---|---|
| Preparation of biological and physical treatment process. | Use drip pans under drums and equipment where feasible. Store process chemicals inside buildings. Inspect the storage yard for filling drip pans and other problems regularly. Train employees on procedures for storing and inspecting chemicals. |
| Soil amending and grass fertilizing .. | Use the appropriate amount of fertilizer. Do not over fertilize. Train employee on proper fertilizing techniques. |
| Liquid storage in above ground storage containers. | Maintain good integrity of all storage containers. Install safeguards (such as diking or berming) against accidental releases at the storage area. Inspect storage tanks to detect potential leaks and perform preventive maintenance. Inspect piping systems (pipes, pumps, flanges, couplings, hoses, and valves) for failures or leaks. Train employees on proper filling and transfer procedures. |
| Pest control | Minimize pesticide application. Only apply pesticide if needed. Train employees on proper pesticide application. |
| Sludge drying beds | Ensure drying bed is draining properly (e.g., check for clogging); avoid overfilling drying bed; grade the land to divert flow around drying bed; berm, dike, or curb drying bed areas; cover drying beds. |
| Sludge storage piles | Confine storage of sludge to a designated area as far from any receiving water body as possible; store sludge on an impervious surface (e.g., concrete pad); grade the land to divert flow around storage piles; berm, dike, or curb sludge storage piles; cover sludge storage piles. |
| Sludge transfer | Promptly remove any sludge spilled during transfer; conduct transfer operations over an impervious surface; avoid transferring sludge during rain events; grade the land to divert flow around transfer areas; berm, curb, or dike transfer areas; avoid locating transfer operations near receiving water bodies. |
| Incineration—ash impoundments/piles. | Line ash impoundments with clay (or other type of impervious material); ensure ash impoundments will hold maximum volume of ash and a 10-year, 24-hour rain event; curb, berm, or dike ash storage areas; avoid locating ash storage areas near receiving water bodies. |
| Miscellaneous | Properly dispose of grit/scum; properly dispose of screens on a daily basis; maximize vegetative cover to stabilize soil and reduce erosion. |

5. Special Conditions

There are no additional requirements under this section other than those stated in the general fact sheet language.

6. Storm Water Pollution Prevention Plan Requirements

There are no additional requirements under this section other than those described in Part VI.C. of this fact sheet.

7. Monitoring and Reporting Requirements

a. *Analytical monitoring requirements.* EPA believes that treatment works may reduce the level of pollutants in storm water runoff from their sites through the development and proper implementation of the storm water pollution prevention plan requirements discussed in today's proposed permit. In order to provide a tool for evaluating the effectiveness of

the pollution prevention plan and to characterize the discharge for potential environmental impacts, the proposed permit requires treatment works to collect and analyze samples of their storm water discharges for the pollutants listed in Table T-4. The pollutants listed in Table T-4 were found to be above benchmark levels for a significant portion of treatment works that submitted quantitative data in the group application process, or are believed to be present based upon the description of industrial activities and significant materials exposed. Because these pollutants have been reported at benchmark levels from facilities covered under this section, EPA is requiring monitoring after the pollution prevention plan has been implemented to assess the effectiveness of the pollution prevention plan and to help

ensure that a reduction of pollutants is realized.

At a minimum, storm water discharges from treatment works must be monitored quarterly during the second year of permit coverage. At the end of the second year of permit coverage, a facility must calculate the average concentration for each parameter listed in Table T-4. If the permittee collects more than four samples in this period, then they must calculate an average concentration for each pollutant of concern for all samples analyzed.

TABLE T-4.—INDUSTRY MONITORING REQUIREMENTS

| Pollutants of concern | Cut-off concentration |
|----------------------------------|-----------------------|
| Total phosphorus | 0.33 mg/L |
| Nitrate + nitrite nitrogen | 0.68 mg/L |

TABLE T-4.—INDUSTRY MONITORING REQUIREMENTS—Continued

| Pollutants of concern | Cut-off concentration |
|-----------------------------------|-----------------------|
| Ammonia | 0.0925 mg/L |
| Total recoverable copper | 0.009 mg/L |
| Total recoverable iron | 0.3 mg/L |
| Total recoverable manganese | 0.05 mg/L |
| Total recoverable zinc | 0.065 mg/L |

If the average concentration for a parameter is less than or equal to the value listed in Table T-4, then the permittee is not required to conduct quantitative analysis for that parameter during the fourth year of the permit. If, however, the average concentration for a parameter is greater than the cut-off concentration listed in Table T-4, then the permittee is required to conduct quarterly monitoring for that parameter

during the fourth year of permit coverage. Monitoring is not required during the first, third, and fifth year of the permit. The exclusion from monitoring in the fourth year of the permit is conditional on the facility maintaining industrial operations and BMPs that will ensure a quality of storm water discharges consistent with the average concentrations recorded during the second year of the permit.

TABLE T-5.—SCHEDULE OF MONITORING

| | |
|-----------------------------------|--|
| 2nd year of permit coverage | <ul style="list-style-type: none"> • Conduct quarterly monitoring. • Calculate the average concentration for all parameters analyzed during this period. • If average concentration is greater than the value listed in Table T-4, then quarterly sampling is required during the fourth year of the permit. • If average concentration is less than or equal to the value listed in Table T-4, then no further sampling is required for that parameter. |
| 4th year of permit coverage | <ul style="list-style-type: none"> • Conduct quarterly monitoring for any parameter where the average concentration in year 2 of the permit is greater than the value listed in Table T-4. • If industrial activities or the pollution prevention plan have been altered such that storm water discharges may be adversely affected, quarterly monitoring is required for all parameters of concern. |

In cases where the average concentration of a parameter exceeds the cut-off concentration, EPA expects permittees to place special emphasis on methods for reducing the presence of those parameters in storm water discharges. Quarterly monitoring in the fourth year of the permit will be used to reassess the effectiveness of the adjusted pollution prevention plan.

b. Alternative certification.

Throughout today's permit, EPA has proposed monitoring requirements for facilities which the Agency believes have the potential for contributing significant levels of pollutants to storm water discharges. The alternative described below is necessary to ensure that monitoring requirements are only imposed on those facilities that do, in fact, have storm water discharges containing pollutants at concentrations of concern. EPA has determined that if materials and activities are not exposed to storm water at the site, then the potential for pollutants to contaminate storm water discharges does not warrant monitoring.

Therefore, a discharger is not subject to the monitoring requirements of this Part provided the discharger makes a certification for a given outfall, on an annual basis, under penalty of law, signed in accordance with Part VII.G. (Signatory Requirements), that material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, industrial machinery or operations, and significant materials from past industrial activity that are located in areas of the facility that are within the

drainage area of the outfall are not presently exposed to storm water and will not be exposed to storm water for the certification period. Such certification must be retained in the storm water pollution prevention plan and submitted to EPA in accordance with Part VI.C of this permit.

c. Reporting requirements. Permittees are required to submit all monitoring results obtained during the second and fourth year of permit coverage within 3 months of the conclusion of each sampling year. Such permittees must submit monitoring results on four separately signed Discharge Monitoring Report Forms to the Director. For facilities conducting monitoring beyond the minimum quarterly requirements an additional Discharge Monitoring Report Form must be filed for each analysis.

d. Sample type. All discharge data shall be reported for grab samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable.

If storm water discharges associated with industrial activity commingle with process or nonprocess water, then

where practicable permittees must attempt to sample the storm water discharge before it mixes with the non-storm water discharge.

EPA requests comments upon a condition of today's proposed permit that would require permittees who are unable to sample storm water discharges before they commingle with non-storm water discharges to sample the combined discharge both during dry and wet weather and submit both sets of data to the permitting authority.

e. Representative discharge. When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may test the effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluent. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

f. Monthly visual examination of storm water quality. Monthly visual

inspections are required of a storm water discharge from each outfall at the treatment works. The inspection must be of a grab sample collected from each storm water outfall. The examination of storm water grab samples shall include any observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, or other obvious indicators of storm water pollution. The inspection must be conducted in a well lit area. No analytical tests are required to be performed on these samples.

The examination must be made at least once in each month of the permit during daylight unless there is insufficient rainfall or snow-melt to runoff. EPA expects that, whenever practicable, the same individual should carry out the collection and examination of discharges throughout the life of the permit to ensure the greatest degree of consistency possible. Grab samples shall be collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 60 minutes) of when the runoff begins discharging. Reports of the visual observation include: the examination date and time, examination personnel, visual quality of the storm water discharge, and probable sources of any observed storm water contamination. The visual observation reports must be maintained onsite with the pollution prevention plan.

When a discharger is unable to collect samples over the course of the monitoring period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

EPA believes that this quick and simple assessment will allow the

permittee to approximate the effectiveness of his/her plan on a regular basis at very little cost. Although the visual examination cannot assess the chemical properties of the storm water discharged from the site, the examination will provide meaningful results upon which the facility may act quickly. The frequency of this visual inspection will also allow for timely adjustments to be made to the plan. If BMPs are performing ineffectively, corrective action must be implemented. A set of tracking or follow-up procedures must be used to ensure that appropriate actions are taken in response to the inspections. The visual examination is intended to be performed by members of the pollution prevention team. This hands-on inspection will enhance the staff's understanding of the storm water problems on that site and the effects of the management practices that are included in the plan. The pollutants selected for consideration and the associated rationale are as follows:

• **Nitrate plus nitrite nitrogen**—Nitrates plus nitrites are produced as a result of the oxidation, via biodegradation, of ammonia nitrogen and organic nitrogen. Nitrates are considered to be poisonous substances in mineralized water. Nitrates and nitrites have been found to contribute to methemoglobinemia in infants. Concentrations of more than 10 mg/L of nitrates in water should not be ingested by infants.

Nitrate plus nitrite nitrogen is considered to be a pollutant of concern for treatment works. Nitrate plus nitrite nitrogen data submitted in part 2 storm water permit applications for treatment works indicate the following:

—The mean concentrations for grab and composite samples were 20.86 mg/L and 20.50 mg/L, respectively;

—The median concentrations for grab and composite samples were 1.09 mg/L and 0.87 mg/L, respectively;

—The 99th percentile concentrations (i.e., 99 percent of the values are below) for grab and composite samples were 213 mg/L and 150 mg/L, respectively.

• **Heavy metals**—As required by 40 CFR 122.26(g)(ii) and (iii), group applicants were only required to sample for metals if the facility knew or had reason to believe they would be expected in the discharge. Of the part 2 data which was statistically summarized, less than 20 percent of the facilities submitting data reported on heavy metals. EPA is requiring permittees to monitor for ammonia, total copper, total iron, manganese, and total zinc. The median grab sample values for these parameters submitted for part 2 of the application are: 0.810 mg/L; 0.013 mg/L; 0.385 mg/L; 0.14 mg/L; and 0.067 mg/L, respectively.

8. Alternative Monitoring Requirements

EPA requests comment upon the following monitoring and reporting requirements in lieu of those listed in Part XI.T.5. of today's proposed permit.

a. **Annual monitoring requirements.** During the period beginning on the effective date and lasting through the expiration date of this permit, permittees covered by this section, as defined by paragraph XI.T.1. must monitor for the parameters identified in Table T-6. Monitoring should occur at least annually (once per year) except as provided in VI.E.7. (Sampling Waiver) and VI.E.6. (Representative Discharge). In addition to the parameters listed below, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event which generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

TABLE T-6.

| Parameter | Unit | Frequency | Sample type ¹ |
|--|------------|--------------|--------------------------|
| Total flow | mg | 1/year | Estimate. |
| Oil & grease | mg/L | 1/year | Grab. |
| Total Suspended Solids (TSS) | mg/L | 1/year | Grab. |
| Biochemical Oxygen Demand (BOD5) | mg/L | 1/year | Grab. |
| pH | standard | 1/year | Grab. |

¹ The grab sample shall be collected in the first 30 minutes of the discharge or as soon thereafter as practical, but not to exceed 60 minutes.

b. **Quarterly visual examination of storm water quality**—(1) Facilities shall perform and document a visual

examination of storm water quality of each storm water discharge associated with industrial activity from the site. If

the storm water flows such that there are numerous small points of discharge, one sample may be collected as a

representative of the adjacent flows. The examination must be made at least once in each designated period (described in Part (2) below) during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(2) Examinations shall be conducted in each of the following periods for the purposes of inspecting storm water quality associated with storm water runoff and snow melt: December to February (storm water runoff or snow melt); March to May (storm water runoff); June to August (storm water runoff); September to November (storm water runoff or snow melt).

(3) Examinations shall be conducted within the first 30 minutes (or as soon thereafter as practical, but not to exceed 60 minutes) of when the runoff begins discharging. The examinations shall include any observations of color, odor, turbidity, floating solids, foam, oil sheen, or other obvious indicators of storm water pollution. No analytical tests are required to be performed on these samples. Examinations shall be conducted so as to provide a reasonable representation of the nature of a typical storm water discharge at that site during that time of year.

(4) Information must be maintained onsite and include: the examination date and time, examination personnel, visual quality of the storm water discharge, and probable sources of any observed storm water contamination.

U. Storm Water Discharges Associated With Industrial Activity From Food and Kindred Products Facilities

1. Discharges Covered Under This Section

On November 16, 1990 (55 FR 47990), EPA promulgated the regulatory definition of "storm water discharges associated with industrial activity." This definition included point source discharges of storm water from 11 major categories of facilities, including:

"* * * (xi) Facilities under Standard Industrial Classifications 20, 21 * * *."

This section covers storm water discharges associated with industrial activities from establishments manufacturing or processing foods and beverages for human consumption, and related products, and prepared feeds for animals and fowls. This section also covers establishments engaged in manufacturing cigarettes, cigars, and other tobacco products. Food and kindred products processing facilities subject to requirements under this section include the following types of operations (i.e., subsectors):

- Meat Products (SIC Codes 2011, 2013, and 2015)

- Dairy Products (SIC Codes 2021, 2022, 2023, 2024, and 2026)

- Canned, Frozen, and Preserved Fruits, Vegetables, and Food Specialties (SIC Codes 2032, 2033, 2034, 2035, 2037, and 2038)

- Grain Mill Products (SIC Codes 2041, 2043, 2044, 2045, 2046, 2047, and 2048)

- Bakery Products (SIC Codes 2051, 2052, and 2053)

- Sugar and Confectionery Products (SIC Codes 2061, 2062, 2063, 2064, 2066, 2067, and 2068)

- Fats and Oils (SIC Codes 2074, 2075, 2076, 2077, and 2079)

- Beverages (SIC Codes 2082, 2083, 2084, 2085, 2086, and 2087)

- Miscellaneous Food Preparations and Kindred Products (SIC Codes 2091, 2092, 2095, 2096, 2097, 2098, and 2099)

- Tobacco Products (SIC Codes 2111, 2121, 2131, and 2141).

Storm water discharges covered by this section include discharges from industrial plant yards; material handling sites; refuse sites; sites used for application or disposal of process wastewaters; sites used for storage and maintenance of material handling equipment; sites used for residual treatment, storage, or disposal; shipping and receiving areas; manufacturing buildings; storage areas for raw materials and intermediate and finished products; and areas where industrial activity has taken place in the past and significant materials remain and where the aforementioned areas are exposed to storm water.

This section does not cover any discharges subject to effluent limitations guidelines, including storm water that combines with process wastewater. Also, storm water that does not come into contact with any raw material, intermediate product, finished product, by-product, or waste product located on the site of the operation are not subject to permitting under this section according to 40 CFR 122.26(b)(14).

When an industrial facility, described by the above eligibility provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other

monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

If monitoring and pollution prevention plan requirements of another industrial activity section of this permit apply to co-located industrial activities at an industrial facility, the eligibility provisions of that industrial activity section shall not preclude the operator of the industrial facility from complying with the applicable monitoring and pollution prevention plan requirements of that section.

2. Industry Profile

From subsectors comprising the Food and Kindred Products Sector, as of January 1, 1993, 26 Part 2 Group Storm Water Applications were received from 9 of the 10 industrial subsectors (excluding tobacco products) and 31 different primary SIC Codes. Subsector descriptions for all facilities within the Food and Kindred Products sector are as follows:

a. Meat products subsector (SIC Code 201X). The Meat Products subsector is separated into three segments. These include meat packing plants (SIC 2011); sausages and other prepared meat products (SIC 2013); and poultry slaughtering and processing (SIC 2015). All three of the industrial segments submitted group application information. Production related activities for these segments include stockyards, slaughtering (killing, blood processing, viscera handling, and hide processing), cutting and deboning, meat processing, rendering, and materials recovery.

b. Dairy products subsector (SIC Code 202X). The Dairy Products subsector is separated into five segments. These segments include creamery butter; natural, processed, and imitation cheese; dry, condensed, and evaporated dairy products; ice cream and frozen desserts; and fluid milk. All five of the industrial segments submitted group application information. Although a variety of operations are encountered in the Dairy Products subsector, the initial operations (e.g., receiving stations, clarification, separation, and pasteurization) are common to most dairy plants and products. However, after these initial operations, the processes and equipment become highly dependent on the product segments. These operations may include: culturing, churning, pressing, curing, blending, condensing, sweetening, drying, milling, and packaging.

c. Canned frozen and preserved fruits, vegetables, and frozen specialties subsector (SIC code 203X). The Canned Frozen and Preserved Fruits, Vegetables,

and Frozen Specialties subsector is separated into six segments. They include canned specialties; canned fruits, vegetables, preserves, jams, and jellies; dried and dehydrated fruits, vegetables, and soup mixes; pickled fruits and vegetables, vegetable sauces and seasonings, and salad dressings; frozen fruits, fruit juices, and vegetables; and other frozen specialties. Five of the six segments are represented in the part 2 application information with the pickled fruits and vegetables, vegetable sauces and seasonings, and salad dressings being the lone segment not represented in the part 2 data by a primary SIC Code (although this segment is represented as a secondary SIC Code). All of the facilities use various fruits or vegetables as the primary raw material. Sweeteners, such as sugar and corn syrup, are used as secondary raw materials. Typically, fruits and vegetables are washed, cut, blanched, and cooked prior to being classified as finished product. Additional operations may include drying, dehydrating, and freezing.

d. Grain mills subsector (SIC code 204X). The Grain Mills subsector is separated into seven segments. These include flour and other grain mill products; cereal breakfast foods; rice milling; prepared flour mixes and doughs; wet corn milling; dog and cat food; and prepared feeds and feed ingredients for animals and fowls, except dogs and cats. Six of the seven segments are represented in the part 2 application information with the rice milling segment being the lone segment not represented in the part 2 data by a primary SIC Code. Process operations performed in the grain mill subsector include: washing, milling, debranning, heat treatment (i.e., steeping, parboiling, drying and cooking), screening, shaping (i.e., extruding, grinding, molding, and flaking), and vitamin and mineral supplementing.

e. Bakery products subsector (SIC code 205X). The Bakery Products subsector is separated into three segments. These include the following industrial activities: Bread and other bakery products, except cookies and crackers; cookies and crackers; and frozen bakery products, except bread. All three segments are represented in the part 2 application information by a primary SIC Code. Process operations in this subsector include mixing, shaping of dough, cooling, and decorating.

f. Sugar and confectionery subsector (SIC Code 206X). The Sugar and Confectionery subsector is separated into seven segments. These include the following industrial activities: Cane sugar, except refining; Cane sugar refining; beet sugar; candy and other confectionery products; chocolate and cocoa products; chewing gum; and salted and roasted nuts and seeds. Only two of the seven segments are represented in the part 2 application information (i.e., candy and other confectionery products and chocolate and other cocoa products). The primary raw materials include sugar, flavorings (including chocolate), flour, nuts, and milk, which are then mixed together, cooked, and then formed using various techniques into specified product shapes. The manufacture of chocolate products requires shelling, roasting, and grinding of the cocoa beans followed by the typical sugar processing operations identified above.

g. Fats and oils subsector (SIC code 207X). The Fats and Oils subsector is separated into five segments. These include the cottonseed oil mills; soybean oil mills; vegetable oil mills, except corn, cottonseed, and soybean; animal and marine fats and oils; and shortening, table oils, margarine, and other edible fats and oils, not elsewhere classified. Only two of the five segments are represented in the part 2 application information (i.e., animal and marine fats and oils and shortening, table oils, margarine, and other edible fats and oils, not elsewhere classified). Typical process operations at an animal and marine fats and oils facility include cooking of inedible fats and oils from butcher shops, supermarkets, food manufacturing facilities, restaurants, and slaughterhouses, tallow and grease separation from proteinaceous solids. The solids are then ground to produce meat and bone meal. Operations at an edible oils manufacturer include refining, bleaching, hydrogenation, fractionation, emulsification, deodorization, filtration, and blending of the crude oils into edible products.

h. Beverages subsector (SIC code 208X). The Beverages subsector is separated into six segments. These include the malt beverages; malt; wines, brandy, and brandy spirits; distilled and blended liquors; bottled and canned soft drinks and carbonated waters; and flavoring extracts and flavoring syrups, not elsewhere classified segments. Four of the six segments are represented by

the part 2 application with malt and wines, brandy, and brandy spirits being the two segments not represented by the part 2 application information. Process operations may include brewing, distilling, fermentation, blending, and packaging (i.e., bottling, canning, or bulk packaging).

i. Miscellaneous food preparation and kindred products subsector (SIC code 209X). The Miscellaneous Food Preparation and Kindred Products subsector is separated into seven industrial segments. These include canned and cured fish and seafood; prepared fresh or frozen fish and seafoods; roasted coffee; potato chips, corn chips, and similar snacks; manufactured ice; macaroni, spaghetti, vermicelli, and noodles; and food preparations, not elsewhere classified segments. Three of the seven segments are represented by the part 2 application information (i.e., prepared fresh or frozen fish and seafoods; potato chips, corn chips, and similar snacks; and macaroni, spaghetti, vermicelli, and noodles). Process operations may include shelling, washing, drying, shaping, baking, frying, and seasoning.

j. Tobacco products subsector (SIC code 21XX). The tobacco products subsector is separated into four segments. These include cigarettes, cigars, chewing and smoking tobacco and snuff, and tobacco stemming and redrying. None of these four segments submitted part 2 application information. Typical process operations may include drying, blending, shaping, cutting and rolling.

3. Pollutants in Storm Water Discharges Associated with Food and Kindred Products Processing Facilities

Typical food and kindred products processing facilities do not conduct many processing operations outdoors. The nature of the business, and the required sanitary conditions, require that the raw materials through final product be protected from storm water. As such, the contamination of storm water from this sector is primarily from the loading and unloading of products and raw materials, spillage and leaks from tanks and containers stored outdoors, waste management practices, pest control, and improper connections to the storm sewer. Table U-1 lists potential pollutant sources from activities that commonly take place at food and kindred products processing facilities.

TABLE U-1.—DESCRIPTION OF POTENTIAL POLLUTANT SOURCES^{i, ii, iii}

| Activity | Pollutant source | Pollutant(s) |
|---|--|---|
| A. Raw material: | | |
| Unloading/product | • Container defects (bags, drums, bottles, crates) | BOD, TSS, O&G, pH, TK ⁱⁱ |
| Loading | • Spills and leaks during unloading/ loading (tanks, rail cars). | |
| | • Failed connections (hoses and couplings). | |
| | • Washdown of unloading/loading area. | |
| B. Storage containers: | | |
| Liquid Storage (i.e., above ground storage tanks). | • Failed piping and connections (couplings, flanges, hoses, and valves). | BOD, TSS, O&G, pH |
| | • External corrosion and structural failure. | |
| | • Spills and overflows due to operator error. | |
| Liquid Storage (drums, carboys, and gallon jugs). | • Outside containers | BOD, TSS, O&G, pH |
| | • Open containers. | |
| | • External corrosion of the containers. | |
| | • Operator handling and transporting. | |
| Solid Storage (silos, holding bins, fiber drums, etc.). | • Spills and leaks from damaged containers. | BOD, TSS, O&G, pH |
| | • Dust and particulates | |
| | • Operator handling and transporting. | |
| | • Spills and leaks. | |
| C. Waste management: | | |
| Air Emissions | • Oven emissions | BOD, TSS, O&G, pH |
| | • Vents. | |
| | • Fine solids handling. | |
| Solid Waste | • Dumpsters and trash cans | BOD, TSS, O&G, pH, copper, manganese |
| | • Spent equipment, scraps, etc. | |
| Wastewater | • Treatment processes (e.g., hydraulic overflow) | BOD, TSS, O&G, pH, fecal coliform |
| | • Outside piping and connections (couplings, flanges, hoses, valves, and pumps). | |
| | • Outside areas of applications | |
| D. Pest control: | | |
| Pesticides, Rodenticides, Insecticides. | • Outside areas of applications | Miscellaneous insecticides, rodenticides, pesticides, etc., TKN |
| E. Improper: Connections to the storm sewer | • Process wastewaters | BOD, TSS, O&G, pH |
| | • Process floor drains. | |
| | • Sanitary sewers. | |
| | • USTs. | |

ⁱ "Standard Handbook of Environmental Engineering," Corbitt, Robert A., McGraw-Hill, Inc., 1990.ⁱⁱ Air Pollution Engineering Manual, Air and Waste Management Association, Edited by Anthony J. Buonicore and Wayne T. Davis, Van Nostrand Reinhold, New York, 1992.ⁱⁱⁱ "Environmental Engineering and Sanitation," Fourth Edition, Salvato, Joseph A., John Wiley & Sons, Inc., 1992.

Impacts caused by storm water discharges from food and kindred products processing facilities will vary from facility to facility. Several factors influence to what extent operations at the site can affect water quality. Such factors include: geographic location; hydrogeology; the types of industrial activities exposed to storm water; the size of the operation; the nature of storm water control measures in place; and the type, duration, and intensity of precipitation events. Each of these factors interact to influence the quantity and quality of storm water runoff. For example, flour/oil particulate emissions from vents (e.g., from baking operations) may be a significant source of pollutants at some facilities, while material storage may be a primary source at others. Similarly, a facility with all storm water from exposed industrial activity diverted to the sanitary sewer would

have less of an impact than a facility not practicing this control option. In addition, sources of pollutants other than storm water, such as illicit connections, spills, and improperly dumped materials, may increase the pollutant loadings discharged in the receiving stream.

EPA reviewed Part 1 Group Storm Water Applications for facilities identified as sampling facilities to determine the types of significant materials from food and kindred products processing that are exposed to storm water. A list of these significant materials is presented in Table U-2. Note that significant materials related to vehicle maintenance (e.g., diesel fuel) and other miscellaneous nonprocessing materials (e.g., lumber) are not included in Table U-2.

TABLE U-2.—SIGNIFICANT MATERIALS EXPOSED TO STORM WATER

| | |
|-------------------------------|---|
| Acids (phosphoric, sulfuric). | Feathers |
| Activated carbon | Feed |
| Ammonia | Ferric chloride |
| Animal cages | Fruits, vegetables, coffee beans |
| Bleach | Gel bone |
| Blood | Grain (Flour, oats, wheat) |
| Bone meal | Hides |
| Brewing residuals | Lard |
| Calcium oxide | Manure |
| Carbon dioxide | Milk |
| Caustic soda | Salts (brine) |
| Chlorine | Skim powder |
| Cheese | Starch |
| Coke oven tar | Sugar (sweetener, honey, fructose, syrup) |
| Detergent | Tallow |
| Eggs | Wastes (off-spec product, sludge) |

TABLE U-2.—SIGNIFICANT MATERIALS
EXPOSED TO STORM WATER—Con-
tinued

| | |
|---------------------------------------|-------|
| Ethyl alcohol | Whey |
| Fats, greases, short- ening, oils. | Yeast |

EPA analyzed data for both the sector as a whole and for each of the nine subsectors reporting analytical data. While examination of the data for each subsector did not identify any significant variation across the subsectors, the limited amount of available data for some of the subsectors failed to provide for meaningful statistical comparisons. As such, except

for the few exceptions noted in Section H.6. (Monitoring and Reporting Requirements), EPA aggregated the data for purposes of conducting a sector analysis. The aggregate sampling data for the food and kindred products processing sector, received by EPA as of January 1, 1993, is presented in Table U-3.

TABLE U-3.—FOOD AND KINDRED PRODUCTS SECTOR STATISTICS FOR POLLUTANTS,ⁱ MG/L

| Pollutant Sample type | No. of samples | | Mean ⁱⁱ | | Minimum ⁱⁱⁱ | | Maximum | | Median | | 95th percentile | | 99th percentile | |
|---|----------------|--------------------|--------------------|-------|------------------------|------|---------|------|--------|------|-----------------|------|-----------------|------|
| | Grab | Comp ^{iv} | Grab | Comp | Grab | Comp | Grab | Comp | Grab | Comp | Grab | Comp | Grab | Comp |
| BOD ₅ | 298 | 287 | 51.2 | 42.5 | 0 | 0 | 1550 | 1360 | 13.9 | 11 | 206 | 180 | 1160 | 968 |
| COD | 296 | 286 | 192.5 | 141.7 | 0 | 0 | 3810 | 2820 | 77 | 63 | 745 | 463 | 2000 | 2040 |
| NO ₃ + NO ₂ | 301 | 289 | 1.17 | .98 | 0 | 0 | 44.9 | 17.7 | .56 | .55 | 3.7 | 3.6 | 12.9 | 9.6 |

| O & G | 300 | N/A | 5.4 | N/A | 0 | N/A | 93 | N/A | 1.1 | N/A | 21 | N/A | 43.5 | N/A |
| Phosphorus | 298 | 287 | 5.13 | 1.32 | 0 | 0 | 970 | 19.7 | .58 | .48 | 9.08 | 5.96 | 24.4 | 10.2 |
| TSS | 298 | 286 | 252 | 200 | 0 | 0 | 3300 | 4530 | 72.5 | 53.5 | 1320 | 900 | 2667 | 2240 |
| Copper | 17 | 17 | .075 | .046 | 0 | 0 | .27 | .24 | .04 | .03 | .27 | .24 | .27 | .24 |
| Manganese | 16 | 16 | .23 | .19 | 0 | 0 | 1.49 | 1.35 | .16 | .08 | 1.49 | 1.35 | 1.49 | 1.35 |
| Iron | 11 | 9 | 2.15 | .45 | .09 | .09 | 18 | 1.9 | .54 | 2 | 18 | 1.9 | 18 | 1.9 |
| Zinc | 33 | 31 | .781 | .792 | 0 | 0 | 13.5 | 7.35 | .21 | .24 | 2.1 | 5.83 | 13.5 | 7.35 |

ⁱ Applications that did not report the units of measurement for the reported values of pollutants were not included in these statistics. Results presented as "not detected" were set at one-half the detection limit for statistical comparison purposes.

ⁱⁱ The mean is calculated using the value "zero" for all concentrations identified as below detection levels.

ⁱⁱⁱ All parameters had at least one sample reported as below detection level (i.e., not detected (ND)).

^{iv} Composite samples.

The selection of parameters for monitoring is based on the nature of operations and exposed materials at food and kindred products processing facilities, the data provided in the part 2 storm water group applications, and

review of EPA's "Development Documents" for the food processing sector. In addition, effluent limitations guidelines currently in effect for process wastewaters were reviewed to identify the types of pollutants that may

reasonably be expected to be present at food processing facilities. A list of these pollutants for all food processing activities regulated by effluent limitations guidelines is presented in Table U-4.

TABLE U-4.—FOOD AND KINDRED PRODUCTS PROCESSING: EFFLUENT LIMITATIONS GUIDELINES

| | | | Ammonia | | |

¹Provides for zero discharge of process wastewater from at least one process operation.

Below is a discussion of the part 2 data.

a. Five-day biochemical oxygen demand. Five-day biochemical oxygen demand (BOD₅) is a measure of the oxygen consuming capabilities of organic matter (i.e., aerobic decomposition) in wastewater over a 5-day period. High BOD₅ concentrations may deplete dissolved oxygen in the receiving waters which could cause anaerobic conditions in the stream, potentially killing all inhabitants of the affected area. BOD₅ is generally considered to be the primary pollutant of concern for most types of food processing facilities due to the fact that food items (e.g., sugars, grains, fruits, miscellaneous food refuse) are highly biodegradable, thus exerting a high oxygen demand. BOD₅ data submitted in the part 2 storm water permit applications for the food and kindred products sector indicate the following:

- The mean concentrations for grabs and composites were approximately 51 mg/L and 43 mg/L, respectively.

- The median concentrations for grabs and composites were approximately 14 mg/L and 11 mg/L, respectively.

- The 95th percentile concentration (i.e., 95 percent of the values are below) for grabs and composites were approximately 206 mg/L and 180 mg/L, respectively.

- The 99th percentile concentration (i.e., 99 percent of the values are below) for grabs and composites were approximately 1160 mg/L and 968 mg/L, respectively.

The data submitted in the part 2 applications clearly show the wide variation in BOD₅ values within the sector. While median concentrations are consistent with concentrations for storm water from residential areas, higher concentrations of BOD₅ are apparent.

b. Total kjeldahl nitrogen, ammonia nitrogen, and nitrate plus nitrite nitrogen. Total Kjeldahl nitrogen (TKN) is a measure of the amount of ammonia nitrogen plus organic nitrogen in the water. Under septic conditions, organic nitrogen decomposes to form ammonia nitrogen. Ammonia nitrogen can add to

eutrophication by supplying nitrogen through its decomposition products. Nitrates plus nitrites are produced as a result of the oxidation, via biodegradation, of ammonia nitrogen and organic nitrogen. Thus, ammonia nitrogen will consume the oxygen supply in a receiving stream. Nitrates are considered to be poisonous substances in mineralized water. Nitrates and nitrites have been found to contribute to methemoglobinemia in infants. Concentrations of over 10 mg/L of nitrates in water should not be ingested by infants.

Sources of nitrogen in storm water from food and kindred products processing facilities include: decomposing animal parts, leaking ammonia refrigeration, ammonia disinfectant, detergents, and meat processing (i.e., curing, pickling, and other processing). Kjeldahl nitrogen is a good indicator of the crude protein in the water, hence, a measure of the quantity of potentially valuable product being lost in the storm water.

TKN data submitted in the part 2 storm water permit applications for the food and kindred products sector indicate the following:

- The mean concentrations for grabs and composites were approximately 5 mg/L and 4 mg/L, respectively.
- The median concentrations for grabs and composites were approximately 2.4 mg/L and 2.0 mg/L, respectively.
- The 95th percentile concentration (i.e., 95 percent of the values are below) for grabs and composites were approximately 18 mg/L and 17 mg/L, respectively.
- The 99th percentile concentration (i.e., 99 percent of the values are below) for grabs and composites were approximately 43 mg/L and 32 mg/L, respectively.

EPA proposes monitoring requirements for TKN because of the high potential for nitrogen releases to the environment from food processing facilities. TKN is used as the indicator for nitrogen in the storm water because it is a good indicator of the crude protein content in the discharge and thus an indication to the permittee of the product being lost via the storm water.

Nitrate plus nitrite nitrogen data submitted in the part 2 storm water permit applications for the food and kindred products sector indicate the following:

- The mean concentrations for grabs and composites were approximately 1.2 mg/L and 1.0 mg/L, respectively.
- The median concentrations for grabs and composites were approximately 0.6 mg/L and 0.6 mg/L, respectively.
- The 95th percentile concentration (i.e., 95 percent of the values are below) for grabs and composites were approximately 3.7 mg/L and 3.6 mg/L, respectively.
- The 99th percentile concentration (i.e., 99 percent of the values are below) for grabs and composites were approximately 12.9 mg/L and 9.6 mg/L, respectively.

Nitrate plus nitrite nitrogen is not considered to be a pollutant of concern for food and kindred products processing facilities. The data provided in the part 2 group applications do not support continued monitoring for these pollutants.

c. Total phosphorus. Total phosphorus is comprised of both dissolved and suspended phosphorus. Phosphorus occurs in natural wastes and wastewaters almost exclusively as phosphates. Phosphorus is a nutrient for aquatic plant life and one of the leading causes of eutrophication in receiving

streams. Concentrations above 25 µg/L may lead to growth of excessive algae and other nuisance plants. A concentration of 1.0 mg/L phosphorus is commonly established at wastewater treatment plants discharging to receiving streams where phosphorus poses a problem.

Phosphorus data submitted in the part 2 storm water permit applications for the food and kindred products sector indicate the following:

- The mean concentrations for grabs and composites were approximately 5.1 mg/L and 1.3 mg/L, respectively.
- The median concentrations for grabs and composites were approximately 0.56 mg/L and 0.48 mg/L, respectively.
- The 95th percentile concentration (i.e., 95 percent of the values are below) for grabs and composites were approximately 9.1 mg/L and 6.0 mg/L, respectively.
- The 99th percentile concentration (i.e., 99 percent of the values are below) for grabs and composites were approximately 24.4 mg/L and 10.2 mg/L, respectively.

The data submitted in the part 2 applications indicate a variation in phosphorus concentrations across the sector. The nature of potential pollutant sources to runoff from food and kindred processing facilities, including detergents and animal feces, can contribute high levels of phosphorus to waterways.

d. Total copper and manganese. EPA is requiring all facilities in this industry to conduct sampling for total copper and manganese. The median grab sample value for total copper is 0.04 mg/L. This is greater than the benchmark level from the "Gold Book: Acute Aquatic Life Freshwater Criteria." The median grab sample for manganese is 0.160 mg/L as compared to a level of concern of 0.05 mg/L as found in the "Gold Book: Human Health Criteria for Consumption of Water Organisms." Because both of the individual values are greater than their corresponding benchmark levels, EPA is requiring all facilities to conduct sampling for these pollutants.

4. Notice of Termination.

The permittee shall notify the permitting authority when discharges authorized under this section of today's proposed permit have permanently ceased or where the operator of storm water discharges associated with industrial activity at a facility changes. Termination of coverage under this section of today's proposed permit will only be granted when all storm water discharges from material handling

equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, or industrial machinery that are exposed to storm water are eliminated.

5. Options for Controlling Pollutants

One option for controlling pollutants in storm water is to set effluent limitations for these discharges. EPA does not consider this to be feasible because of the lack of performance data necessary to develop limitations.

Pursuant to 40 CFR 122.44(k), permits may contain Best Management Practices (BMPs) to control or abate the discharge of pollutants in storm water, when applicable (and where numeric effluent limitations are infeasible). EPA believes that the most effective BMPs for reducing pollutants in storm water discharges from food and kindred products processing facilities is through exposure minimization and good housekeeping practices. Exposure minimization practices reduce the potential for storm water to come in contact with pollutants. Good housekeeping practices ensure that the facility is responsive to routine and non-routine activities that may increase exposure of pollutants to storm water. The BMPs necessary to address these two concerns are generally uncomplicated and inexpensive practices. They are easy to implement, and require little or no maintenance. Minor capital expenses, such as construction of cement pads or berms/dikes, may be necessary in some cases, although these types of control structures already exist at many food and kindred products processing facilities. In a few instances, more intensive BMPs, such as detention ponds or filtering devices, may be necessary depending on the type of discharge, types and concentrations of contaminants, and volume of flow, although these occurrences are expected to be very low for the sector as a whole. The types of material management practices identified in the storm water group applications for the food and kindred products processing sector, for sampling facilities only, are identified in Table U-5. In fact, part 1 group application data indicate that BMPs are widely implemented at food and kindred products processing facilities.

The selection of the most effective BMPs will be based on site-specific considerations such as: facility size, climate, geographic location, geology/hydrogeology and the environmental setting of each facility, and volume and type of discharge generated. Each facility will be unique in that the source, type, and volume of

contaminated storm water will differ. In addition, the fate and transport of pollutants in these discharges will vary. EPA believes that the management practices discussed herein are well suited mechanisms to prevent or control the contamination of storm water discharges associated with food and kindred products processing facilities.

Table U-6.1 identifies general BMPs that are applicable to a variety of food and kindred products processing subsectors, while Table U-6.2 identifies BMPs for specific processing operations.

6. Storm Water Pollution Prevention Plan Requirements

All facilities included in this section of today's proposed permit must prepare and implement a storm water pollution prevention plan. The establishment of a pollution prevention plan requirement reflects EPA's decision to allow operators of food and kindred products processing facilities to utilize BMPs as the BAT/BCT level of control for the storm water discharges covered by this section. The requirements included in pollution prevention plans provides a flexible framework for the development and implementation of site-specific controls to minimize pollution in storm water discharges. This approach is consistent with the approach used in the baseline general permits finalized on September 9, 1992 (57 FR 41236).

EPA believes that pollution prevention is the most effective approach for controlling contaminated storm water discharges from food and kindred products processing facilities. Pollution prevention plans allow the operator of a facility to select BMPs based on site-specific considerations such as: Facility size; climate; geographic location; hydrogeology; the environmental setting of each facility; and volume and type of discharge generated. This flexibility is necessary because each facility will be unique in that the source, type and volume of contaminated surface water discharges will differ from site to site.

There are two major objectives to a pollution prevention plan: (1) to identify sources of pollution potentially affecting the quality of storm water discharges associated with industrial activity from a facility, and (2) to describe and ensure implementation of practices to minimize and control pollutants in storm water discharges associated with industrial activity from a facility.

TABLE U-5.—MATERIAL MANAGEMENT PRACTICES^{i,ii}

| Absorbent mats | Preventative maintenance |
|--|--------------------------------|
| Baghouse BMPs | Retaining wall |
| Catch basin | Roof drains |
| Concrete pad | Sealed tanks |
| Containment | Shoveling |
| Cover (drums, holding pen, loading, storage) | Site inspection |
| Curbing | Spill prevention plan |
| Diking | Spillstoppers |
| Diversions | Stone filters |

ⁱNPDES Storm Water Group Applications—Part 2. Application Nos. 12, 13, 37, 81, 125, 159, 178, 179, 312, 436, 437, 446, 541, 557, 583, 584, 599, 630, 730, 789, 811, 819, 935, 936, 1006, 1096, 1147, and 1159.

ⁱⁱNPDES Storm Water Group Applications—Part 1. Application Nos. 12, 13, 37, 60, 81, 125, 144, 159, 178, 179, 312, 436, 437, 446, 533, 541, 545, 557, 583, 584, 599, 630, 680, 730, 733, 789, 811, 819, 932, 935, 936, 1006, 1096, 1147, 1159, and 1217.

Specific requirements for a pollution prevention plan for food and kindred products processing facilities are described below. These requirements must be implemented in addition to the baseline pollution prevention plan provisions discussed previously.

a. Contents of the plan. Storm water pollution prevention plans are intended to aid operators of food and kindred products processing facilities to evaluate all potential pollution prevention sources at a site, and assist in the selection and implementation of appropriate measures designed to prevent, or control, the discharge of pollutants in storm water runoff. EPA has developed guidance entitled "Storm Water Management for Industrial Activities: Developing Pollution Prevention Plans and Best Management Practices," EPA, 1992 (EPA 832-R-92-006), to assist permittees in developing and implementing pollution prevention measures.

(1) *Pollution prevention team.* As a first step in the process of developing and implementing a storm water pollution prevention plan, permittees must identify a qualified individual or team of individuals to be responsible for

developing the plan and assisting the facility or plant manager in its implementation. When selecting members of the team, the plant manager should draw on the expertise of all relevant departments within the plant to ensure that all aspects of plant operations are considered when the plan is developed. The plan must clearly describe the responsibilities of each team member as they relate to specific components of the plan. In addition to enhancing the quality of communication between team members and other personnel, clear delineation of responsibilities will ensure that every aspect of the plan is addressed by a specified individual or group of individuals. Pollution Prevention Teams may consist of one individual where appropriate (e.g., in certain small businesses with limited storm water pollution potential).

(2) *Description of potential pollutant sources.* Each storm water pollution prevention plan must describe activities, materials, and physical features of the facility that may contribute to storm water runoff or, during periods of dry weather, result in dry weather flows. This assessment of storm water pollution prevention will support subsequent efforts to identify and set priorities for necessary changes in materials, materials management practices, or site features, as well as aid in the selection of appropriate structural and nonstructural control techniques. Plans must describe the following elements:

TABLE U-6.1.—GENERAL STORM WATER BMPs FOR THE FOOD AND KINDRED PRODUCTS PROCESSING SECTOR^{i, ii, iii, iv}

| Activity | BMPs |
|--|--|
| A. Raw material unloading/product loading: | <ul style="list-style-type: none"> • Ensure that a facility representative is present during unloading/loading activities. • Inspect the unloading/loading areas to detect problems before they occur. |
| Shipping and Receiving. | <ul style="list-style-type: none"> • Close storm drains during loading/unloading activities in surrounding area. • Inspect all containers prior to unloading/loading of any raw or spent materials. • Install backflow prevention devices on liquid transfer equipment. |

TABLE U-6.1.—GENERAL STORM WATER BMPs FOR THE FOOD AND KINDRED PRODUCTS PROCESSING SECTOR i, ii, iii, iv—Continued

| Activity | BMPs |
|--|--|
| | <ul style="list-style-type: none"> Inspect all connection equipment (e.g., hoses and couplings), and replace when necessary, before performing unloading/loading activities. Perform all unloading/loading activities in a covered and/or enclosed areas. Use drip pans when loading/unloading liquid product. Situate loading/unloading areas indoors or in a covered area. Use rubber seals in truck loading dock areas to contain spills indoors. Drain hoses back into truck, railcar, etc. after loading/unloading materials. Install high level alarm on tanks to prevent overfilling. Ensure that berms and dikes are built around the unloading/loading areas, if applicable. If outside or in covered areas, minimize runoff of storm water into the unloading/loading areas by grading the areas to ensure that storm water runs off. Use dry cleanup methods for unloading/loading areas rather than washing the areas down. Train employees on proper unloading/loading techniques. Initiate an inventory control for all raw and spent materials. |
| B. Storage containers: Liquid storage | <ul style="list-style-type: none"> Inspect the external condition (corrosion, leaks) of the containers. |

TABLE U-6.1.—GENERAL STORM WATER BMPs FOR THE FOOD AND KINDRED PRODUCTS PROCESSING SECTOR i, ii, iii, iv—Continued

| Activity | BMPs |
|--|--|
| Liquid storage (drums, carboys, and gallon jugs). | <ul style="list-style-type: none"> Inspect the general area around the containers. Ensure that berms and dikes are built around the containers. Cover and/or enclose. Bulkhead liquid storage tanks indoors (i.e., tank outlets located inside buildings). Ensure that all containers are closed (e.g., valves shut, lids and manways sealed, caps closed). Wash containers indoors before storing empty containers outdoors. If outside or in a covered area, minimize runoff of storm water into a storage area by grading area to ensure that storm water runs "off" and not "on". Train employees on proper storage techniques (e.g., filling and transferring contents). Maintain employee training on proper handling and transportation of materials. Maintain an inventory control of all raw and spent materials. Employ measures to protect against spillage from the overflows (e.g., high level sensors, alarms). Consider vacuum emission control systems for airborne dust and particulate matter. |
| Solid storage (silos, holding bins, fiber drums, etc.). | <ul style="list-style-type: none"> Perform treatment processes in-house, if possible. |
| C. Waste management: Wastewater | |

TABLE U-6.1.—GENERAL STORM WATER BMPs FOR THE FOOD AND KINDRED PRODUCTS PROCESSING SECTOR i, ii, iii, iv—Continued

| Activity | BMPs |
|---|---|
| Solid waste (paper, wood pellets, scrap metals, refuse, etc.). | <ul style="list-style-type: none"> Inspect the outside pipe connections (couplings, valve seals and gaskets, flanges, etc.) of the treatment system for leaks, corrosion, and poor maintenance upkeep. Inspect the general area around the solid waste (e.g., look for signs of leaching). Store waste so that it is physically contained (dumpsters, drums, bags). Store waste in an enclosed/covered area. If outside or in a covered area, minimize exposure to storm water by grading the area to ensure that storm water runs "off" and not "on". Ensure hazardous waste disposal practices are performed in accordance with Federal, State, and local requirements. Route trash compactor leakage to treatment system or sanitary sewer. |
| Air emissions | <ul style="list-style-type: none"> Clean around vents and stacks to atmosphere from process and storage areas. Place tubs around vents and stacks for easy collection of settling particles. Inspect air emission control systems (e.g., baghouses) regularly and repair and replace as necessary. Route overflows/condensates from process vents to onsite treatment system or to the sanitary sewer. |

TABLE U-6.1.—GENERAL STORM WATER BMPs FOR THE FOOD AND KINDRED PRODUCTS PROCESSING SECTOR i, ii, iii, iv—Continued

| Activity | BMPs |
|------------------|---|
| D. Pest control: | <ul style="list-style-type: none"> Follow manufacturers directions for application of pest control materials to site. Time application for dry weather conditions. Store partially full containers indoors or undercover. Apply insecticides during breeding months. Protect rat bait houses from storm water. |

TABLE U-6.1.—GENERAL STORM WATER BMPs FOR THE FOOD AND KINDRED PRODUCTS PROCESSING SECTOR i, ii, iii, iv—Continued

| Activity | BMPs |
|---|---|
| E. Improper connections to the storm sewer: | <ul style="list-style-type: none"> Perform smoke or dye testing to determine if inter-connections exist between the sanitary and storm sewers. Plug all floor drains leading to storm sewers. Update facility schematics to accurately reflect all plumbing connections. |
| F. General | <ul style="list-style-type: none"> Offer employee incentives so that employees will develop cost effective, worker efficient BMPs. Request outside firm to conduct a storm water inspection/audit. |

TABLE U-6.1.—GENERAL STORM WATER BMPs FOR THE FOOD AND KINDRED PRODUCTS PROCESSING SECTOR i, ii, iii, iv—Continued

| Activity | BMPs |
|----------|--|
| | <ul style="list-style-type: none"> Inspect material transfer lines/connections for leaks or signs of wear and repair or replace as necessary. |

TABLE U-6.2.—SPECIFIC STORM WATER BMPs FOR THE FOOD AND KINDRED PRODUCTS PROCESSING SECTOR i, ii, iii, iv

| Activity | BMPs |
|--|--|
| A. Meat Products: | |
| • Animal holding pens (beef, chicken) | <ul style="list-style-type: none"> Inspect area around animal holding pens. Enclose/cover fowl hanging area. Enclose/cover the animal holding pens. Grade the areas around the animal holding pens to ensure storm water "runs off" and not "on" to the holding pen. Train employees on proper material (i.e., hide, hair, feathers, animal parts) clean-up procedures around and within the animal holding pens. Store animal manure and other materials from clean-up activities in appropriate containers in an enclosed/covered area. Area for trailers holding empty bird cages should have storm water runoff/runoff controls in place. Use mechanical sweepers around site to clean up fugitive feathers, dust, and manure. |
| B. Dairy Products: | |
| • Packaged dairy products (spoiled and broken product containers). | <ul style="list-style-type: none"> Inspect area around aged/spoiled dairy products. Store aged/spoiled dairy products in enclosed area. Train employees on proper disposal methods for all aged/spoiled dairy products. Ensure that all aged/spoiled product (e.g., bottles, cartons, plastic containers) are disposed of in a proper manner (bagged, covered). |
| C. Canned Frozen and Preserved Fruits, Vegetables, and Frozen Specialties: | |
| • Fruit and vegetable storage and disposal | <ul style="list-style-type: none"> Inspect all fruit and vegetable storage areas. Store all fruits and vegetables in appropriate containers (e.g., bins, bushels, baskets, buckets) and in enclosed/covered areas. Store empty fruit and vegetable containers in an enclosed/covered area. Train employees on proper handling/disposal methods for fresh/rotten fruits and vegetables. Consider air emission control systems for all cooking processes to reduce particulate matter. Minimize fruit and vegetable storage time outdoors. |
| D. Grain Mills: | |
| • Grain handling, storage and mixing | <ul style="list-style-type: none"> Inspect the general area around the grain storage. Store all grain in appropriate containers (e.g., silos, hoppers) in an enclosed/covered area. Train employees on grain handling procedures. Consider a vacuum control system in all grain mixing areas. |
| E. Bakery Products: | |
| • Ingredient storage and mixing | <ul style="list-style-type: none"> Inspect ingredient storage areas. Store all ingredients (e.g., corn sweeteners, flour, shortening, syrup, vegetable oils) in appropriate containers (e.g., tanks, drums, bags) in an enclosed/covered area. Remove flour/oil dust accumulation around ventilation exhaust systems. |
| • Baking process | |

TABLE U-6.2.—SPECIFIC STORM WATER BMPs FOR THE FOOD AND KINDRED PRODUCTS PROCESSING SECTOR i, ii, iii, iv—Continued

| Activity | BMPs |
|---|--|
| F. Sugar and Confectionery: • Sugar handling. | • Install an air emission control system for all baking processes to reduce particulate matter. |
| G. Fats & Oils: • Fats and oils storage and disposal | • Consider a vacuum control system in all granular and powdered processing areas. |
| | • Inspect all fats and oils storage areas. |
| | • Store all fats and oils, (e.g., butcher shop materials, hair, hide, tallow, bone meal, and offal) in enclosed/covered areas. |
| | • Ensure all fats and oils are physically contained. |
| H. Beverages: • Material storage and mixing | • Ensure grain is stored in enclosed/covered area. |
| | • Consider an air emission control system for all grain handling and brewing processes. |
| | • Protect reusable beverage containers that are stored outdoors from storm water contact. |

^{iv} Storm Water Management for Industrial Activities: Developing Pollution Prevention Plans and Best Management Practices (EPA 832-R-92-006), EPA, Office of Water, September 1992.

(a) *Drainage*—The plan must contain a map of the site that shows the pattern of storm water drainage, structural and nonstructural features that control pollutants in storm water runoff, and process wastewater discharges, surface water bodies (including wetlands), places where significant materials are exposed to rainfall and runoff, and locations of major spills and leaks that occurred in the 3 years prior to the effective date of this section of today's proposed permit. The map must also show areas where the following general activities take place: loading/unloading areas; vehicle fueling; vehicle and equipment maintenance and/or cleaning areas; waste treatment, storage, and disposal locations; and liquid storage tanks. In addition, as identified in the Part 1 Storm Water Group Applications, the following areas are also potential sources of pollutants in storm water from food and kindred products processing facilities: vents and stacks from cooking and drying operations and dry product vacuum transfer lines; animal holding pens; spoiled product and broken product container storage areas; and significant dust or particulate generating areas. In addition, the site map must identify all monitoring locations that must be sampled as part of the monitoring requirements identified in Section H.5. (Monitoring and Reporting Requirements). This will allow for a direct comparison of the industrial activities exposed to storm water with the analytical data for storm water discharges from these areas.

(b) *Inventory of exposed materials*—Facility operators are required to carefully conduct an inspection of the site and related records to identify significant materials that are or may be

exposed to storm water. The inventory must address materials that within 3 years prior to the effective date of the permit have been handled, stored, processed, treated, or disposed of in a manner to allow exposure to storm water. Findings of the inventory must be documented in detail in the pollution prevention plan. At a minimum, the plan must describe the method and location of onsite storage or disposal; practices used to minimize contact of materials with rainfall and runoff; existing structural and nonstructural controls that reduce pollutants in storm water runoff; existing structural controls that limit process wastewater discharges; and any treatment that the runoff receives before it is discharged to surface waters or a separate storm sewer system. The description must be updated whenever there is a significant change in the types or amounts of materials, or material management practices, that may affect the exposure of materials to storm water.

(c) *Significant spills and leaks*—The plan must include a list of any significant spills and leaks of toxic or hazardous pollutants that occurred in the 3 years prior to the effective date of the permit. Significant spills include, but are not limited to, releases of oil or hazardous substances in excess of quantities that are reportable under Section 311 of CWA (see 40 CFR 110.10 and 117.21) or Section 102 of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) (see 40 CFR 302.4). Significant spills may also include releases of oil or hazardous substances that are not in excess of reporting requirements and releases of materials

that are not classified as oil or a hazardous substance.

(d) *Non-storm water discharges*—Each pollution prevention plan must include a certification, signed by an authorized individual, that discharges from the site have been tested or evaluated for the presence of non-storm water discharges. The certification must describe possible significant sources of non-storm water, the results of any test and/or evaluation conducted to detect such discharges, the test method or evaluation criteria used, the dates on which tests or evaluations were performed, and the onsite drainage points directly observed during the test or evaluation. Pollution prevention plans must identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water discharge.

(e) *Sampling data*—Any existing data on the quality or quantity of storm water discharges from the facility must be described in the plan. The description should include a discussion of the methods used to collect and analyze the data. Sample collection points should be identified in the plan and shown on the site map. Also, the plan should identify the types of storm water discharges (i.e., applicable sectors) being sampled at each outfall.

(f) *Summary of potential pollutant sources*—The description of potential pollutant sources culminates in a narrative assessment of the risk potential that the industrial activities, materials, and physical features of the site pose to storm water quality. Any such activities, materials, or features must be addressed by the measures and controls subsequently described in the plan. In conducting the assessment, the facility operator must consider the

following activities: loading/unloading areas; vehicle fueling; vehicle and equipment maintenance and/or cleaning areas; waste treatment, storage, and disposal locations; liquid storage tanks; vents and stacks from cooking and drying operations and dry product vacuum transfer lines; animal holding pens; out-of-date/spoiled product storage areas; and significant dust or particulate generating areas. The assessment must list any significant pollution sources at the site and identify the pollutant parameter or parameters (e.g., biochemical oxygen demand, oil and grease, etc.) associated with each source.

In addition to food and kindred products processing related industrial activities, the plan must also describe application and storage of pest control chemicals (e.g., rodenticides, insecticides, fungicides, etc.) used at the facility, including a discussion of application and storage procedures.

(3) *Measures and controls.* The permittee must evaluate, select, and describe the pollution prevention measures, BMPs, and other controls that will be implemented at the facility. EPA emphasizes the implementation of pollution prevention measures and BMPs that reduce possible pollutant discharges at the source. Source reduction measures include, among others, preventative maintenance, chemical substitution, spill prevention, good housekeeping, training, and proper materials management. Where source reduction is not appropriate, EPA supports the use of source control measures and BMPs such as material segregation or covering, water diversion, and dust control. If source reduction or source control are not possible, recycling or treatment are the remaining alternatives. Recycling allows the reuse of storm water while treatment lowers pollutant concentrations prior to discharge. Since the majority of food and kindred products processing is conducted indoors, the activities identified above are geared towards only those activities that may contribute pollutants to storm water. Also because of the relatively few activities that are conducted outdoors within this sector, pollution prevention measures, BMPs, and other controls should be relatively few and easy for any given permittee. Also, these measures are the most appropriate means to reduce pollutant loadings to storm water (as opposed to pollutant limitations) because of the relative ease and the significant reductions in pollutant loads that can be realized. The permittee should consider the general storm water BMPs for the food and kindred products processing

sector identified in Table U-6.1 and the subsector specific BMPs provided in Table U-6.2 when assessing the need for storm water measures and controls.

The pollution prevention plan must discuss the reasons each selected control or practice is appropriate for the facility and how each of the potential pollutant sources will be addressed. The plan must also identify the times during which each control or practice will be implemented. Also, the plan should summarize the effects that the controls or practices will have on storm water discharges from the site. At a minimum, the measures and controls must address the following components:

(a) *Good housekeeping*—Permittees must describe protocols established to reduce the possibility of mishandling chemicals or equipment and training employees in good housekeeping techniques. Specifics of this plan must be communicated to appropriate plant personnel.

(b) *Preventative maintenance*—Permittees are required to develop a preventative maintenance program that includes regular inspections and maintenance of storm water BMPs. The purpose of the inspections is to assess the effectiveness of the storm water pollution prevention plan. The inspections allow facility personnel to monitor the success or failure of elements of the plan on a regular basis. The use of an inspection checklist should be considered. A checklist ensures that all required areas are inspected, as well as providing documentation for the recordkeeping requirement.

(c) *Spill prevention and response procedures*—Permittees are required to identify appropriate material handling procedures, storage requirements, containment or diversion equipment, and spill cleanup procedures that will minimize the potential for spills and in the event of a spill enable proper and timely response. Areas and activities that typically pose a high risk for spills at food and kindred products processing facilities include raw material unloading and product loading areas, material storage areas, and waste management areas (e.g., dumpsters, compactors). These activities and areas, and their accompanying drainage points, must be described in the plan.

(d) *Inspections*—In addition to, or as part of, the comprehensive site evaluation required under XI.U.6.b. (Comprehensive Site Compliance Evaluation) of this section of today's proposed permit, qualified personnel must inspect designated equipment and areas of the facility at appropriate intervals as specified in the plan. Areas

that are found to possibly contribute pollutants to storm water are identified in this section of today's proposed permit as requisite areas for periodic scheduled inspections. A set of tracking or follow-up procedures must be used to ensure that appropriate actions are taken in response to the inspections. Records of inspections must be maintained. Inspections shall be carried out by qualified facility personnel at least once each year.

(e) *Employee training*—Permittees must describe a program for informing personnel at all levels of responsibility of the components and goals of the storm water pollution prevention plan. Training should address topics such as good housekeeping, materials management, and spill response procedures. A schedule for conducting this training must be provided in the plan. Where appropriate, contractor personnel also must be trained in relevant aspects of storm water pollution prevention.

(f) *Recordkeeping and internal reporting procedures*—Permittees must describe procedures for developing and retaining records on the status and effectiveness of plan implementation. The plan must address spills, monitoring, and BMP inspection and maintenance activities. Ineffective BMPs must be reported and the date of their corrective action noted.

(g) *Sediment and erosion control*—Permittees must identify areas that, due to topography, activities, soils, cover materials, or other factors have a high potential for significant soil erosion. Measures to limit erosion in these areas must be identified.

(h) *Management of runoff*—Permittees must provide a narrative assessment of traditional storm water management practices that divert, infiltrate, reuse, or otherwise manage storm water runoff so as to reduce the discharge of pollutants. Based on the assessment, the permittee must identify practices that are reasonable and appropriate for the facility and must describe the particular pollutant source area or activity to be controlled by each storm water management practice. Reasonable and appropriate practices must be implemented and maintained.

b. *Comprehensive site compliance evaluation.* The storm water pollution prevention plan must describe the scope and content of comprehensive site inspections that qualified personnel will conduct to (1) confirm the accuracy of the description of potential pollution sources contained in the plan, (2) determine the effectiveness of the plan, and (3) assess compliance with the terms and conditions of this section of

today's proposed permit. Comprehensive site compliance evaluations must be conducted at least annually for food and kindred products processing facilities. The individual or individuals who will conduct the inspections must be identified in the plan and should be members of the pollution prevention team. Inspection reports must be retained for at least 3 years after the date that the permit expires.

Based on the results of each inspection, the description of potential pollution sources, and measures and controls, the plan must be revised as appropriate within 2 weeks after each inspection. Changes in the measures and controls must be implemented on the site in a timely manner, and never more than 12 weeks after completion of the inspection.

7. Monitoring and Reporting Requirements

a. Analytical monitoring requirements. EPA believes that food and kindred products facilities may reduce the level of pollutants in storm water runoff from their sites through the development and proper implementation of the storm water pollution prevention plan requirements discussed in today's proposed permit. In order to provide a tool for evaluating the effectiveness of the pollution prevention plan and to characterize the discharge for potential environmental impacts, the proposed permit requires food and kindred products facilities to collect and analyze samples of their storm water discharges for the pollutants listed in Table U-7. The pollutants listed in Table U-7 were found to be above benchmark levels for a significant portion of food and kindred products facilities that submitted quantitative data in the group application process, or are believed to be present based upon the description of industrial activities and significant materials exposed. Because these pollutants have been reported at benchmark levels from food and kindred products facilities, EPA is requiring monitoring after the pollution prevention plan has been implemented to assess the effectiveness of the pollution prevention plan and to help ensure that a reduction of pollutants is realized.

At a minimum, storm water discharges from food and kindred product facilities must be monitored quarterly during the second year of permit coverage. At the end of the second year of permit coverage, a facility must calculate the average concentration for each parameter listed in Table U-7, and applicable to that

industrial sector. If the permittee collects more than four samples in this period, then they must calculate an average concentration for each pollutant of concern for all samples analyzed.

TABLE U-7.—INDUSTRY MONITORING REQUIREMENTS

| Pollutants of concern | Cut-off concentration (mg/L) |
|--|------------------------------|
| Five-day Biochemical Oxygen Demand (BOD) | 9.0 |
| Ammonia | 0.093 |
| Total Kjeldahl Nitrogen (TKN) | 1.5 |
| Total Phosphorus | 0.33 |
| Total Recoverable Copper | 0.009 |
| Total Recoverable Manganese | 0.05 |
| Total Recoverable Iron | 0.3 |
| Total Recoverable Zinc | 0.065 |

If the average concentration for a parameter is less than or equal to the value listed in Table U-7, then the permittee is not required to conduct quantitative analysis for that parameter during the fourth year of the permit. If, however, the average concentration for a parameter is greater than the cut-off concentration listed in Table U-7, then the permittee is required to conduct quarterly monitoring for that parameter during the fourth year of permit coverage. Monitoring is not required during the first, third, and fifth year of the permit. The exclusion from monitoring in the fourth year of the permit is conditional on the facility maintaining industrial operations and BMPs that will ensure a quality of storm water discharges consistent with the average concentrations recorded during the second year of the permit.

TABLE U-8.—SCHEDULE OF MONITORING

| 2nd Year of Permit Coverage. | |
|------------------------------|--|
| | <ul style="list-style-type: none"> • Conduct quarterly monitoring. • Calculate the average concentration for all parameters analyzed during this period. • If average concentration is greater than the value listed in Table U-8, then quarterly sampling is required during the fourth year of the permit. • If average concentration is less than or equal to the value listed in Table U-8, then no further sampling is required for that parameter. |

TABLE U-8.—SCHEDULE OF MONITORING—Continued

| 4th Year of Permit Coverage. | |
|------------------------------|--|
| | <ul style="list-style-type: none"> • Conduct quarterly monitoring for any parameter where the average concentration in year 2 of the permit is greater than the value listed in Table U-8. • If industrial activities or the pollution prevention plan have been altered such that storm water discharges may be adversely affected, quarterly monitoring is required for all parameters of concern. |

In cases where the average concentration of a parameter exceeds the cut-off concentration, EPA expects permittees to place special emphasis on methods for reducing the presence of those parameters in storm water discharges. Quarterly monitoring in the fourth year of the permit will reassess the effectiveness of the adjusted pollution prevention plan.

b. Alternative certification. Throughout today's permit, EPA has proposed monitoring requirements for facilities which the Agency believes have the potential for contributing significant levels of pollutants to storm water discharges. The alternative described below is necessary to ensure that monitoring requirements are only imposed on those facilities that do, in fact, have storm water discharges containing pollutants at concentrations of concern. EPA has determined that if materials and activities are not exposed to storm water at the site, then the potential for pollutants to contaminate storm water discharges does not warrant monitoring.

Therefore, a discharger is not subject to the monitoring requirements of this part provided the discharger makes a certification for a given outfall, on an annual basis, under penalty of law, signed in accordance with Part VII.G. (Signatory Requirements), that material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, industrial machinery or operations, significant materials from past industrial activity, or, in the case of airports, deicing activities, that are located in areas of the facility that are within the drainage area of the outfall are not presently exposed to storm water and will not be exposed to storm water for the certification period. Such certification must be retained in the storm water pollution prevention plan and submitted to EPA in accordance with Part VI.C. of this permit.

c. Reporting requirements. Permittees are required to submit all monitoring results obtained during the second and fourth year of permit coverage within 3 months of the conclusion of each year. Such permittees must submit monitoring results on four separately signed Discharge Monitoring Report Forms to the Director. For facilities conducting monitoring beyond the minimum quarterly requirements an additional Discharge Monitoring Report Form must be filed for each analysis.

d. Sample type. All discharge data shall be reported for grab samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable.

If storm water discharges associated with industrial activity commingle with process or nonprocess water, then where practicable permittees must attempt to sample the storm water discharge before it mixes with the non-storm water discharge.

EPA requests comments upon a condition of today's proposed permit that would require permittees who are unable to sample storm water discharges before they commingle with non-storm water discharges to sample the combined discharge both during dry and wet weather and submit both sets of data to the permitting authority.

e. Representative discharge. When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may test the effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluent. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an

estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

f. Monthly visual examination of storm water quality. Monthly visual inspections of a storm water discharge from each outfall are required. The inspection must be of a grab sample collected from each storm water outfall. The examination of storm water grab samples shall include any observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, or other obvious indicators of storm water pollution. The inspection must be conducted in a well lit area. No analytical tests are required to be performed on these samples.

The examination must be made at least once in each month of the permit during daylight unless there is insufficient rainfall or snow-melt to runoff. EPA expects that, whenever practicable, the same individual should carry out the collection and examination of discharges throughout the life of the permit to ensure the greatest degree of consistency possible. Grab samples shall be collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 60 minutes) of when the runoff begins discharging. Reports of the visual observation include: the examination date and time, examination personnel, visual quality of the storm water discharge, and probable sources of any observed storm water contamination. The visual observation reports must be maintained onsite with the pollution prevention plan.

EPA believes that this quick and simple assessment will allow the permittee to approximate the effectiveness of his/her plan on a regular basis at very little cost. Although the visual examination cannot assess the chemical properties of the storm water discharged from the site, the examination will provide meaningful results upon which the facility may act quickly. The frequency of this visual inspection will also allow for timely adjustments to be made to the plan. If BMPs are performing ineffectively, corrective action must be implemented. A set of tracking or follow-up procedures must be used to ensure that appropriate actions are taken in response to the inspections. The visual examination is intended to be performed by members of the pollution prevention team. This hands-on inspection will enhance the staff's understanding of the storm water problems on that site and effects on the management practices that are included in the plan.

When a discharger is unable to collect samples over the course of the monitoring period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

g. Baseline general permit variance. On September 9, 1992, and September 25, 1992, EPA published the Final NPDES General Permits for Storm Water Discharges Associated With Industrial Activity. These notices set out requirements for semiannual monitoring for several parameters for discharges from meat packing plants, poultry packing plants, and facilities that manufacture animal and marine fats and oils. These notices specifically require that facilities with storm water discharges that are associated with meat packing plants, poultry packing plants, and facilities that manufacture animal and marine fats and oils are required to monitor their storm water discharges for BOD₅, oil and grease, COD, total suspended solids, total Kjeldahl nitrogen, total phosphorus, pH, and fecal coliform. Today's proposed permit contains monitoring requirements for BOD₅, total Kjeldahl nitrogen, total phosphorus, total copper, manganese, ammonia, total iron, and total zinc. EPA requests comment upon the difference between the monitoring requirements set out for meat packing plants, poultry packing plants, and facilities that manufacture animal and marine fats and oils facilities in the September 1992 General Permits and those required in today's proposed permit.

8. Alternative Monitoring Requirements

In addition, EPA requests comment upon the following monitoring and reporting requirements in lieu of those in Part XI.U.6. of today's proposed permit.

a. Annual monitoring requirements. Beginning on the effective date and lasting through the expiration date of this permit, all food and kindred products processing facilities regulated under this section must monitor storm water discharges annually (1 time per year) except as provided in VI.A. (Sampling Waiver and Representative Discharge) of the baseline general permit, for each outfall discharging storm water meeting the conditions of section XI.U.1. (Eligibility) of this

section. Permittees must monitor for the following storm water pollutants:

TABLE U-9.—MONITORING REQUIREMENTS

| Parameter | Units | Frequency | Sample type |
|--|--------------|----------------|-------------|
| Total Flow | MGD | 1/year | estimate. |
| BOD ₅ | mg/L | do | grab. |
| TSS | mg/L | do | Do. |
| Oil and Grease | mg/L | do | Do. |
| Total Kjeldahl Nitrogen ¹ | mg/L | do | Do. |
| Total Phosphorus ^{1,2} | mg/L | do | Do. |
| Fecal Coliform ¹ | col/ml | do | Do. |
| pH | s.u. | do | Do. |

¹ Applicable to facilities with storm water discharges associated with industrial activity from animal handling areas, manure management (or storage) areas, and production waste management (or storage) areas that are exposed to precipitation at meat packing plants, poultry packing plants, and facilities that manufacture animal and marine fats and oils.

² Applicable to facilities in SIC Codes 204 (i.e., grain mills) and other facilities that store, use, or manage chemicals containing phosphorus (excluding phosphoric acid) exposed to storm water.

In addition to the parameters listed above, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event which generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total flows (in gallons) of the discharge sampled;

b. Sample type. For all discharges, data shall be reported for one grab sample only. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall retain with the monitoring results a description of why a grab sample during the first 30 minutes was impracticable. If the storm water from such operation flows such that there are numerous small points of discharge, one sample may be collected to represent the adjacent flows.

c. Quarterly visual examination of storm water quality. Facilities shall perform and document a visual examination of storm water quality of each storm water discharge associated with industrial activity exposed to storm water. The inspection must be of a grab sample collected from each storm water outfall. The examination must be made at least once in each designated period (described in XI.U.8.c.(1) below) during daylight hours unless there is

insufficient rainfall or snow melt to produce a runoff event.

(1) Examinations shall be conducted in each of the following periods for the purposes of visually inspecting storm water quality associated with storm water runoff or snow melt: December to February; March to May; June to August; and September to November.

(2) Examinations shall be conducted within the first 30 minutes (or as soon thereafter as practical, but not to exceed 1 hour) of when the runoff or snowmelt begins discharging. The examinations shall include any observations of color, odor, turbidity, floating solids, foam, oil sheen, or other obvious indicators of storm water pollution. The inspection must be conducted in a well lit area. One of the four quarterly samples must be used for the annual monitoring requirements specified in Part XI.U.8.a. above. No analytical tests are required to be performed on the remaining three samples. Examinations shall be conducted so as to provide a reasonable representation of the nature of a typical storm water discharge at that site during that time of year.

(3) Information must be maintained onsite and include: the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge, and probable sources of any observed storm water contamination.

(4) Based on the results of the quarterly visual inspection, the description of potential pollutant sources and pollution prevention measures and controls identified in the pollution prevention plan shall be revised as appropriate within 2 weeks of such inspection and shall provide implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the inspection.

d. Retention of records—(1) The permittee shall retain the pollution prevention plan developed in accordance with Parts VI. and XI.U.3. (Storm Water Pollution Prevention Plans) of this permit until at least 1 year after coverage under this permit terminates. The permittee shall retain all records of all monitoring information, copies of all reports required by this permit, and records of all data used to complete the Notice of Intent to be covered by this permit, until at least 3 years after coverage under this permit terminates. This period may be explicitly modified by alternative provisions of this permit (see paragraph XI.U.8.d.(2) (below) of this permit) or extended by request of the Director at any time.

(2) Permittees must submit monitoring results as required in Part VI.A. (Monitoring Requirements) to the Director upon the request of the Director.

V. Storm Water Discharges Associated With Industrial Activity From Textile Mills, Apparel, and Other Fabric Product Manufacturing Facilities

1. Discharges Covered Under this Section

Special permit conditions have been developed for textile mills, apparel, and other fabric product manufacturing facilities. The conditions proposed in this section apply to storm water discharges from textile related operations located on any of the facilities covered under the storm water application regulations [40 Code of Federal Regulations (CFR) 122.26] and applying for coverage under this section.

The storm water application regulations define storm water discharges associated with industrial activity at 40 CFR 122.26(b)(14).

Category (xi) of this definition includes facilities under Standard Industrial Classifications 22 and 23. The conditions proposed in this section apply to storm water discharges from the following activities under major industrial groups 22 and 23: Textile Mill Products, of and regarding facilities and establishments engaged in the preparation of fiber and subsequent manufacturing of yarn, thread, braids, twine, and cordage, the manufacturing of broadwoven fabrics, narrow woven fabrics, knit fabrics, and carpets and rugs from yarn; processes involved in the dyeing and finishing of fibers, yarn fabrics, and knit apparel; the integrated manufacturing of knit apparel and other finished articles of yarn; the manufacturing of felt goods (wool), lace goods, nonwoven fabrics, miscellaneous textiles, and other apparel products.

Facilities in Major Group 22 typically receive and prepare fibers, transform these materials into fabric or related products, and finish the materials before packaging. Facilities in Major Group 23 typically receive woven or knitted fabric for cutting, sewing, and packaging. For more information on the industrial activities at textile facilities, consult EPA's "Development Document for Effluent Limitations Guidelines and

Standards for the Textile Mills" (Document EPA 440/1-79/0226, October 1979).

When an industrial facility, described by the above eligibility provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

If monitoring and pollution prevention plan requirements of another industrial activity section of this permit apply to co-located industrial activities at an industrial facility, the eligibility provisions of that industrial activity section shall not preclude the operator of the industrial facility from complying with the applicable monitoring and

pollution prevention plan requirements of that section.

Pollutants in Storm Water Discharges Associated with the Manufacture of Textile Products

The Agency has conducted a careful examination of the data submitted by the group, including a review of supplementary information regarding the textile industry. Based on a review of this information, the following pollutants and/or pollutant parameters may be present in storm water discharges associated with textile products manufacturing:

- *Conventional Pollutants*—Biochemical Oxygen Demand (BOD₅), Total Suspended Solids (TSS), pH
- *Toxic Pollutants*—Total chromium, total aluminum, total copper, total lead, total zinc
- *Nonconventional Pollutants*—Chemical Oxygen Demand (COD), phenols, sulfides.

Based on group application information and data, and the "Development Document for Effluent Limitation Guidelines and Standards for the Textile Mills," EPA has identified the storm water pollutants and sources resulting from textile manufacturers in Table V-1.

TABLE V-1

| Activity | Pollutant source | Pollutant |
|--|--|---|
| Raw material storage and handling | wool, cotton, synthetics, rayon, other fibers, coal/wood piles, fuels, oil, lubricants | TSS, pH, oil and grease, COD, BOD ₅ , lead, chromium, benzene. |
| Storage and handling of materials for dyeing | Dyes, dye preservatives, pigments | Copper, phenols, lead, chromium, zinc, aluminum, acids. |
| Storage and handling of materials for scouring and cleaning | wool, scouring agents, detergents | BOD ₅ , COD, TSS, oil and grease, sulfides, phenols, pH, chromium. |
| Storage and handling of materials for bleaching, printing, finishing, and other activities | Dyes, bleaches, detergents, finishing agents, printing products | BOD ₅ , COD, TSS, oil and grease, sulfides, phenols, pH, chromium, hydrogen peroxide, acids. |

Table V-2 indicates the sampling data results for part 2 conventional pollutant data submitted to EPA. This table indicates the minimum and maximum values, means, medians, 95th percentiles, 99th percentiles, and the total number of data submittals for each

of the conventional pollutants. As Table V-2 indicates, large variations in the minimum and maximum values were often found for each of the eight conventional pollutants monitored. For example:

- Composite samples of TSS ranged from 0 mg/L to 1,675 mg/L
- Grab samples of COD ranged from 0 mg/L to 308 mg/L
- Oil and grease values ranged from 0 mg/L to 42 mg/L.

TABLE V-2.—STATISTICS FOR CONVENTIONAL POLLUTANTS IN STORM WATER,ⁱ
[mg/L, except as noted]

| Pollutant Sample Type | # of samples | | Mean | | Minimum | | Maximum | | Median | | 95th percentile | | 99th percentile | |
|--------------------------------|--------------|-------------------|------|------|---------|------|---------|-------|--------|------|-----------------|-------|-----------------|-------|
| | Grab | Comp ^u | Grab | Comp | Grab | Comp | Grab | Comp | Grab | Comp | Grab | Comp | Grab | Comp |
| BOD ₅ | 110 | 107 | 11.4 | 9.8 | 0.0 | 0.0 | 50.0 | 50.2 | 7.8 | 7.0 | 38.0 | 29.0 | 44.0 | 41.4 |
| COD | 110 | 107 | 69.2 | 48.1 | 0.0 | 0.0 | 306.0 | 212.0 | 44.0 | 37.0 | 228.0 | 111.0 | 287.0 | 174.3 |
| Nitrate-Nitrite Nitrogen | 110 | 107 | 1.3 | 1.1 | 0.0 | 0.0 | 71.0 | 65.0 | 0.4 | 0.4 | 2.5 | 1.9 | 5.5 | 3.1 |
| Total Kjeldahl Nitrogen | 106 | 103 | 2.7 | 1.9 | 0.0 | 0.0 | 44.8 | 10.3 | 1.7 | 1.5 | 6.5 | 5.4 | 25.1 | 9.8 |
| Oil and Grease | 111 | N/A | 2.9 | N/A | 0.0 | 0.0 | 42.0 | N/A | 0.0 | N/A | 14.0 | N/A | 34.0 | N/A |
| pH (s.u.) | 105 | N/A | N/A | N/A | 3.8 | N/A | 10.2 | N/A | N/A | N/A | N/A | N/A | N/A | N/A |
| Total Phosphorus | 109 | 106 | 0.4 | 0.3 | 0.0 | 0.0 | 11.0 | 11.0 | 0.1 | 0.1 | 0.7 | 0.6 | 6.7 | 2.6 |
| Total Suspended Solids | 110 | 107 | 126 | 80 | 0 | 0 | 1888 | 1675 | 36 | 22 | 410 | 380 | 1860 | 683 |

ⁱApplications that did not report the units of measurement for the reported values of pollutants were not included in these statistics.^uComposite samples.

Options for Controlling Pollutants

Table V-3 lists some BMPs which may be effective in limiting the amount of pollutants in storm water discharges from textile facilities. Many of the BMPs suggested focus on the process aspect of textile manufacturing. Although processes are typically conducted indoors, EPA believes that changes in the manufacturing process, such as a switch to less toxic chemicals, can lessen the amount of contamination in

storm water discharges. The BMPs listed are not necessarily required to be implemented. Rather, BMPs should be chosen based on the specific nature of the storm water discharges at each textile facility and implemented as appropriate. Based on part 1 information, several of the BMPs suggested are already in place at many of the facilities. Part 1 submittals indicate that diking or other types of diversion occur at 55 percent of the

sampling facilities. Nineteen percent of the sampling facilities noted that they use some form of covering as a BMP, and catch basins are in place at 45 percent. In addition, 64 percent of the facilities designated as samplers in part 1 information reported they had a Spill Prevention Control and Countermeasure Plan in place, while 56 percent used swales, 29 percent had vegetation strips, and 12 percent utilized ponds to collect storm water.

TABLE V-3

| Activity | BMPs |
|--|--|
| Preparation (e.g., Desizing and Scouring) | Waste stream reuse for typical bleach unit processing; recycle J-box or kler drain wastes to saturator. Make use of countercurrent washing. |
| Dyeing | Use washer waste from scour operation for batch scouring. Perform analysis of spent dye baths for residual materials. Where feasible, obtain background information and data necessary before making product substitutions. This includes OSHA form 20 data and technical data. Be aware of potential problem chemicals, such as aryl phenol ethoxylates, chlorinated aromatics, chlorinated aromatics, and metals. Employ pad batch dyeing to eliminate the need for salts and chemical specialties from the dyebath, with associated reduction in cost and pollution source reduction. |
| Finishing | Reuse residual portions of finish mixes as much as possible by adding back to them the required components to make up the next mix. Return noncontact cooling water and stream condensates to either a hot water holding tank or a clear well. If neither is available, segregate waste streams from sources which do not generally require treatment from other waste streams that do require treatment. |
| General Water Conservation Techniques | Use "low liquor ratio" dyeing machines where practicable. Use of foam processing (mercerizing, bleaching, dyeing, finishing) where practicable as a water conservation process. |
| Chemical Screening and Inventory Control | Employ prescreening practices to evaluate and consider chemicals on a wide range of environmental and health impact criteria. Develop and perform a routine raw material quality control program. Review and develop procedures for source reduction of metals. Promptly transfer used fluids to the proper container; do not leave full drip pans or other open containers around the shop. Empty and clean drip pans and containers. Do not pour liquid waste down floor drains, sinks, or outdoor storm drain inlets. Plug floor drains that are connected to the storm or sanitary sewer; if necessary, install a sump that is pumped regularly. Inspect the maintenance area regularly for proper implementation of control measures. |
| Material Handling: Bulk Liquid Storage and Containment | Train employees on proper waste control and disposal procedures. Store permanent tanks in a paved area surrounded by a dike system which provides sufficient containment for the larger of either 10 percent of the volume of all containers or 110 percent of the volume of the largest tank. Maintain good integrity of all storage tanks. Inspect storage tanks to detect potential leaks and perform preventive maintenance. Inspect piping systems (pipes, pumps, flanges, couplings, hoses, valves) for failures or leaks. |
| Material Handling: Containerized Material Storage | Train employees on proper filling and transfer procedures. Store containerized materials (fuels, paints, solvents, etc.) in a protected, secure location and away from drains. Store reactive, ignitable, or flammable liquids in compliance with the local fire code. Label all materials clearly. Identify potentially hazardous materials, their characteristics, and use. Control excessive purchasing, storage, and handling of potentially hazardous materials. Keep records to identify quantity, receipt date, service life, users, and disposal routes. Secure and carefully monitor hazardous materials to prevent theft, vandalism, and misuse of materials. Educate personnel for proper storage, use, cleanup, and disposal of materials. |

TABLE V-3—Continued

| Activity | BMPs |
|---|--|
| Material handling: designated material mixing areas | <p>Provide sufficient containment for outdoor storage areas for the larger of either 10 percent of the volume of all containers or 110 percent of the volume of the largest tank.</p> <p>Use temporary containment where required by portable drip pans.</p> <p>Use spill troughs for drums with taps.</p> <p>Mix solvents in designated areas away from drains, ditches, and surface waters.</p> <p>If spills occur:</p> <ul style="list-style-type: none"> • Stop the source of the spill immediately. • Contain the liquid until cleanup is complete. • Deploy oil containment booms if the spill may reach the water. • Cover the spill with absorbent material. • Keep the area well ventilated. • Dispose of cleanup materials properly. • Do not use emulsifier or dispersant. |

NPDES Storm Water Group Applications—Part 1. Received by EPA March 18, 1991 through December 31, 1992.

4. Special Conditions

There are no additional requirements beyond those described in Part VLB of this fact sheet.

5. Storm Water Pollution Prevention Plan Requirements

The permit conditions that apply to storm water discharges from textile mills, apparel and other fabric product manufacturing facilities are, in part, established upon the basic requirements in the baseline general permit for storm water discharges from industrial activities, finalized on September 9, 1992 (57 FR 41236). The following discussion addresses only those conditions that may differ from conditions required in the baseline permit.

a. Contents of the plan—(1)

Description of potential pollutant sources. Under the description of potential pollutant sources in the storm water pollution prevention plan requirements, permittees are required to include processing areas, loading/unloading areas, treatment, storage, and waste disposal areas, liquid storage tanks, fueling areas, on a site facility map. EPA believes that this is appropriate since these areas may potentially be a significant source of pollutants to storm water.

(2) Measures and controls. Under the description of measures and controls in the storm water pollution prevention plan requirements, this section proposes that all areas that may contribute pollutants to storm water discharges shall be maintained in a clean, orderly manner. This section also proposes that the following areas must be specifically addressed:

(a) Material storage areas—All stored and containerized materials (fuels, petroleum products, solvents, dyes, etc.) must be stored in a protected area, away from drains and clearly labeled. The plan must describe measures that prevent or minimize contamination of storm water runoff from such storage areas. The facility should specify which materials are stored indoors and must provide a description of the containment area or enclosure for those materials which are stored outdoors. Above ground storage tanks, drums, and barrels permanently stored outside must be delineated on the site map with a description of the appropriated containment measures in place to prevent leaks and spills. The facility may consider an inventory control plan to prevent excessive purchasing, storage, and handling of potentially hazardous substances. In the case of storage of empty chemical drums and containers, facilities should employ such practices as triple-rinsing containers. The discharge waters from such washings must be collected, contained, or treated, and facilities should identify where the discharge will be released.

(b) Material handling area—The plan must describe measures that prevent or minimize contamination of the storm water runoff from materials handling operations and areas. The facility may consider the use of spill and overflow protection; covering fuel areas; covering and enclosing areas where the transfer of materials may occur. Where applicable, the plan must address the replacement or repair of leaking connections, valves, transfer lines and pipes that may carry chemicals, dyes, or wastewater.

(c) Fueling areas—The plan must describe measures that prevent or minimize contamination of the storm water runoff from fueling areas. The facility may consider covering the fueling area, using spill and overflow protection, minimizing runoff of storm water to the fueling area, using dry cleanup methods, and/or collecting the storm water runoff and providing treatment or recycling.

(d) Above ground storage tank areas—The plan must describe measures that prevent or minimize contamination of the storm water runoff from above ground storage tank areas. The facility must consider storage tanks and their associated piping and valves. The facility may consider: regular cleanup of these areas, preparation of a spill prevention control and countermeasure program, providing spill and overflow protection, minimizing runoff of storm water from adjacent facilities and properties, restricting access to the area, inserting filters in adjacent catch basins, providing absorbent booms in unbermed fueling areas, using dry cleanup methods, permanently sealing drains within critical areas that may discharge to a storm drain.

(3) Comprehensive site compliance evaluation. EPA believes that the incorporation of management practices such as those suggested will substantially reduce the potential for these activities and areas to significantly contribute pollutants to storm water discharges. In addition, EPA believes that these requirements continue to provide the necessary flexibility to address the variable risk for pollutants in storm water discharges associated with different facilities. Further, many facilities will find that management

measures that have already been incorporated into the facility's operation, such as the installation of overfill protection equipment and labelling and maintenance of used oil storage units, are already required under existing EPA programs and will meet the requirements of this section.

Under the preventive maintenance requirements, the plan specifically includes the routine inspection of sediment traps to ensure that solids will be intercepted and retained prior to entering the storm drainage system. Because of the nature of operations which occur at textile facilities, specific routine attention needs to be placed on the collection of solids.

Under the inspection requirements this section requires that, in addition to the comprehensive site evaluation required under Part IV of today's proposed permit, qualified facility personnel shall be identified to inspect designated equipment and areas of the facility, at a minimum, on a monthly basis.

The purpose of the inspections is to check on the implementation and effectiveness of the storm water pollution prevention plan. The inspections allow facility personnel to monitor the success or failure of elements of the plan on a regular basis. The use of an inspection checklist is highly encouraged. The checklist will ensure that all required areas are inspected, as well as help to meet the record keeping requirements.

The permittee is required to identify at least 6-month interval (twice per year) dates for employee training. Employee training must, at a minimum, address the following areas when applicable to a facility: Use of reused/recycled waters; solvents management; proper disposal of dyes; proper disposal of petroleum products and spent lubricants; spill prevention and control; fueling procedures; general good housekeeping practices. Employees, independent contractors, and customers must be informed about BMPs and be required to perform in accordance with these practices. Copies of BMPs and any specific management plans, including emergency phone numbers, shall be posted in the work areas. EPA, therefore, is proposing to require that employee training take place at least twice a year to serve as: (1) Training for new employees; (2) a refresher course for existing employees; and (3) training for all employees on any storm water pollution prevention techniques recently incorporated into the plan.

6. Monitoring and Reporting Requirements

a. Monitoring requirements. The regulatory modifications at 40 CFR 122.44(i)(2) established on April 2, 1992, grant permit writers the flexibility to reduce monitoring requirements in storm water discharge permits. EPA has determined that the potential for storm water discharges to contain pollutants above benchmark levels, because of the industrial activities and materials exposed to precipitation, does not support sampling at facilities covered by this section of today's permit. Based on a consideration of the BMPs typically used at these facilities, and generally low pollutant values from the application data, EPA believes that the pollution prevention plan with visual observations of storm water discharges will help to ensure storm water contamination is minimized. Because permittees are not required to conduct sampling, they will be able to focus their resources on developing and implementing the pollution prevention plan.

Quarterly visual inspections of a storm water discharge from each outfall are required at textile manufacturing facilities. The inspection must be of a grab sample collected from each storm water outfall. The examination of storm water grab samples shall include any observations of color, odor, turbidity, floating solids, foam, oil sheen, or other obvious indicators of storm water pollution. The inspection must be conducted in a well lit area. No analytical tests are required to be performed on these samples.

The examination must be made at least once in each designated period during daylight hours unless there is insufficient rainfall or snow-melt to runoff. EPA expects that, whenever practicable, the same individual should carry out the collection and examination of discharges throughout the life of the permit to ensure the greatest degree of consistency possible. Examinations shall be conducted in each of the following periods for the purposes of inspecting storm water quality associated with storm water runoff and snow melt: December to February; March to May; June to August; September to November. Grab samples shall be collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 60 minutes) of when the runoff begins discharging. Reports of the visual observation include: the examination date and time, examination personnel, visual quality of the storm water discharge, and probable sources of any observed storm water

contamination. The visual observation reports must be maintained onsite with the pollution prevention plan.

EPA believes that this quick and simple assessment will help the permittee to determine the effectiveness of his/her plan on a regular basis at very little cost. Although the visual examination cannot assess the chemical properties of the storm water discharged from the site, the examination will provide meaningful results upon which the facility may act quickly. The frequency of this visual inspection will also allow for timely adjustments to be made to the plan. If BMPs are performing ineffectively, corrective action must be implemented. A set of tracking or follow-up procedures must be used to ensure that appropriate actions are taken in response to the inspections. The visual examination is intended to be performed by members of the pollution prevention team. This hands-on inspection will enhance the staff's understanding of the storm water problems on that site and the effects of the management practices that are included in the plan.

When a discharger is unable to collect samples over the course of the monitoring period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

As discussed above, EPA does not believe that chemical monitoring is necessary for textile mills, apparel, and other fabric product manufacturing facilities. EPA believes that between quarterly visual inspections and site compliance evaluations potential sources of contaminants can be recognized, addressed, and then controlled with BMPs. In determining the monitoring requirements, EPA considered the nature of the industrial activities and significant materials exposed at these sites, and performed a review of data provided in Part 2 group applications.

7. Alternative monitoring requirements

EPA requests comment upon the following monitoring and reporting requirements in lieu of those listed in Part XI.V.5. of today's proposed permit.

a. Annual monitoring requirements. During the period beginning on the effective date and lasting through the

expiration date of this permit, permittees must monitor the storm water discharges identified below at least annually (1 time per year). In addition to the parameters listed in

Table V-4 below, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event that generated the

sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

TABLE V-4.—STORM WATER MONITORING PARAMETERS

| Parameter | Unit | Frequency | Sample type ¹ |
|---|----------|-----------|--------------------------|
| Total Flow | gallons | 1/year | estimate. |
| Biochemical Oxygen Demand (BOD ₅) | mg/L | do | grab. |
| Oil & Grease | mg/L | do | Do. |
| Chemical Oxygen Demand (COD) | mg/L | do | Do. |
| Total Suspended Solids (TSS) | mg/L | do | Do. |
| pH | standard | do | Do. |
| Total Recoverable Aluminum | mg/L | do | Do. |
| Total Recoverable Copper | mg/L | do | Do. |
| Total Recoverable Zinc | mg/L | do | Do. |
| Total Recoverable Chromium | mg/L | do | Do. |
| Total Recoverable Lead | mg/L | do | Do. |
| Sulfide | mg/L | do | Do. |
| Phenols | mg/L | do | Do. |
| Acute whole effluent toxicity ² | mg/L | do | Do. |

¹ The grab sample shall be collected in the first 30 minutes of the discharge or as soon thereafter as practical, but not to exceed 60 minutes.

² The acute whole effluent toxicity shall be performed in accordance with Part XI.V.5.d. of this section.

b. Semiannual and reporting requirements. During the period beginning on the effective date of this permit, textile facilities with activities identified in either Tables V-5 and V-6 must monitor those storm water discharges identified below at least semiannually (2 times per year). Permittees with textile facilities engaging in activities identified in Tables V-5 and V-6 below shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event which generated the sample runoff; the duration between the storm event sampled and the previous measurable (greater than 0.1 inch rainfall) storm event; and estimate of the total volume (in gallons) of the discharge sampled.

² The resultant runoff should contain no visible sheen and no visible discharge of oil, floating solids, or foam other than in trace amounts.

TABLE V-6.—STORM WATER RUNOFF FROM PETROLEUM STORAGE AND HANDLING AREAS

| Parameter | Unit | Frequency | Sample type |
|----------------|----------|-------------|-------------|
| Flow | gallons | semi-annual | estimate. |
| pH | standard | do | grab. |
| Benzene | µg/L | do | Do. |
| Oil and Grease | mg/L | do | Do. |

¹ The grab sample shall be collected in the first 30 minutes of the discharge or as soon thereafter as practical, but not to exceed 60 minutes.

c. Sample type. For discharges from holding ponds or other impoundments with a retention period greater than 24 hours, (estimated by dividing the volume of the detention pond by the estimated volume of water discharged during the 24 hours previous to the time that the sample is collected) a minimum of one grab sample may be taken. For all other discharges, data shall be reported for a grab sample. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The grab sample shall be taken during the first 30 minutes of the discharge. If the

collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable.

d. Toxicity testing—(1) Test procedures—(a) The permittee shall conduct acute 24-hour static toxicity tests on both an appropriate invertebrate and an appropriate fish (vertebrate) test species (EPA/600/4-90-027 Rev. 9/91, Section 6.1). Freshwater species must be used for discharges to freshwater bodies. Due to the nonsaline nature of rainwater, freshwater should also be used for discharges to estuarine, marine, or other naturally saline waterbodies.

(b) All test organisms, procedures, and quality assurance criteria used shall be in accordance with "Methods for Measuring the Acute Toxicity of Effluents to Freshwater and Marine Organisms," EPA/600/4-90-027, or the most current edition. The control water used will be moderately hard water as described in EPA/600/4-90-027, Table 6, or the most current edition.

(c) Tests shall be conducted annually (once per year) on a grab sample of the discharge. Test shall be conducted using 100 percent effluent (no dilution) and a control consisting of synthetic dilution water. Results of all tests conducted with any species shall be reported according to EPA/600/4-90-027 (or the most current edition), Section 12, Report Preparation, and the report submitted to EPA with the Discharge

TABLE V-5.—DISCHARGES FROM COAL AND/OR WOOD CHIP STORAGE AREAS

| Parameter | Unit | Frequency | Sample type |
|------------------------|----------|------------|-------------|
| Flow | gallons | semiannual | estimate. |
| pH | standard | do | grab. |
| Total suspended solids | mg/L | do | Do. |

¹ The grab sample shall be collected in the first 30 minutes of the discharge or as soon thereafter as practical, but not to exceed 60 minutes.

Monitoring Reports (DMRs). On the DMR, the permittee shall report "0" if there is no statistical difference between the control mortality and the effluent mortality for each dilution. If there is statistical difference (exhibits toxicity), the permittee shall report "1" on the DMR.

(2) If acute whole effluent toxicity (statistically significant difference between the 100 percent dilution and the control) is detected in the storm water discharges, the permittee shall review the storm water pollution prevention plan and make appropriate modifications to assist in identifying the sources of toxicity and to reduce the toxicity of their storm water discharges. A summary of the review and the resulting modifications shall be provided in the plan.

e. Reporting: when to submit—(1) Permittees that are required to conduct sampling pursuant to Section 7.a. shall monitor samples collected during the sampling period running from January to December. Such permittees shall submit monitoring results obtained during the reporting period running from January to December on Discharge Monitoring Report Form(s) postmarked no later than the 28th day of the following January.

(2) Permittees that are required to conduct sampling pursuant to Part XI.V.7.b. shall monitor samples collected during the sampling period from July to December. Such permittees shall submit monitoring results obtained during the reporting period running from January to December on Discharge Monitoring Report Form(s) postmarked no later than the 28th day of the following required for each sampling period. The first report may include less than 12 months of information.

8. Cost Estimates

This section, which covers textile mills, apparel and other fabric product manufacturing facilities, does not include numeric effluent limits. The BMPs described within today's proposed permit and fact sheet are designed to prevent or minimize pollutants in the storm water runoff. Facilities choose and implement the BMPs which best fit site specific requirements. Because this section does not contain numeric effluent limits or requirements to implement specific, predetermined BMPs, an economic achievable analysis is not required.

W. Storm Water Discharges Associated With Industrial Activity From Wood and Metal Furniture and Fixture Manufacturing Facilities

1. Discharges Covered Under This Section.

On November 16, 1990 (55 FR 47990), the U.S. Environmental Protection Agency (EPA) promulgated the regulatory definition of "storm water discharges associated with an industrial activity." This definition included point source discharges of storm water from eleven major categories of facilities, including facilities under Standard Industrial Classification (SIC) codes 2434 and 25. Part XI.W. of today's proposed permit only covers storm water discharges associated with industrial activities from furniture and fixture manufacturing facilities. Furniture and fixture manufacturing facilities eligible for coverage under this section include facilities identified by the following SIC codes:

- Wood Kitchen Cabinets (SIC Code 2434).
- Household Furniture (SIC Code 251).
- Office Furniture (SIC Code 252).
- Public Buildings and Related Furniture (SIC Code 253).
- Partitions, Shelving, Lockers, and Office and Store Fixtures (SIC Code 254).
- Miscellaneous Furniture and Fixtures (SIC Code 259).

Storm water discharges covered by this section include all discharges where material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, or industrial machinery are exposed to precipitation and storm water runoff. Storm water that does not come into contact with an industrial activity or a significant material are not subject to permitting according to 40 CFR 122.26. This section is not applicable to any discharge subject to effluent limitation guidelines. However, the storm water component of the unpermitted discharge may be included under this section.

When an industrial facility, described by the above eligibility provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of

this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

If monitoring and pollution prevention plan requirements of another industrial activity section of this permit apply to co-located industrial activities at an industrial facility, the eligibility provisions of that industrial activity section shall not preclude the operator of the industrial facility from complying with the applicable monitoring and pollution prevention plan requirements of that section.

2. Industry Profile

The manufacturing processes for furniture and fixture manufacturing facilities are not typically exposed to storm water. However, unloading operations and the storage of some raw materials, and waste products, may be exposed to precipitation. Because of the lack of industrial activities occurring outdoors and the necessity of keeping many of the raw materials dry, the primary sources of storm water pollutants originate from materials handling and waste management or disposal activities. Table W-1 lists potential pollutant source activities, and related pollutants associated with furniture and fixture manufacturing facilities. There are two primary types of furniture and fixture manufacturing facilities. The distinction is based on the primary raw material, wood or metal. The manufacturing processes and significant materials to produce wood and metal furniture or fixtures are not similar. However, the manufacturing activities and wood resources are not typically exposed to precipitation.

TABLE W-1.—ACTIVITIES, POLLUTANT SOURCES, AND POLLUTANTS

| Activity | Pollutant source | Pollutant |
|--------------------------|---------------------------|--------------------------------|
| Wood drying | Coal | TSS, pH, cadmium, arsenic. |
| | Saw dust | TSS, COD, BODs, pH. |
| Furniture manufacturing. | Ash | TSS, pH. |
| | Sizing operations. | TSS, BODs, pH. |
| | Painting operations | Lead, cadmium, COD. |
| | Gluing operations. | Solvents, COD, oil and grease. |

TABLE W-1.—ACTIVITIES, POLLUTANT SOURCES, AND POLLUTANTS—Continued

| Activity | Pollutant source | Pollutant |
|-------------------|---------------------------------|--|
| | Used rags | Solvents; COD, oil and grease. |
| | Processing materials unloading. | Diesel fuel, gasoline, oil, TSS. |
| | Waste material transportation. | TSS, BOD ₅ , pH. |
| | Treatment facilities. | Solvents, COD, oil & grease. |
| | Open dumps . | TSS, BOD ₅ , oil & grease, COD. |
| Other activities. | Air emission control cleaning. | TSS, pH, cadmium, lead, copper, zinc. |

Source: Storm Water Group Applications, Parts 1 and 2.

Industrial activities occurring at furniture and fixture manufacturing facilities that pertain to the storm water rule include, " * * * but [are] not limited to, storm water discharges from industrial plant yards; material handling sites; refuse sites; sites used for the application or disposal of process wastewaters (as defined at 40 CFR Part 401); sites used for the storage and maintenance of material handling equipment; sites used for residual treatment, storage, or disposal; shipping and receiving areas; manufacturing buildings; storage areas (including tank farms) for raw materials and intermediate and finished materials; and areas where industrial activity has taken place in the past and significant materials remain and are exposed to storm water" (40 CFR 122.26(b)(14)). The most common industrial activities at furniture and fixture manufacturing facilities include material handling sites and raw material storage areas.

Significant materials include, " . . . but [are] not limited to: Raw materials; fuels; materials such as solvents, detergents, and plastic pellets; finished materials such as metallic products; * * * hazardous substances designated under Section 101(14) of CERCLA; any chemical facilities required to report pursuant to Section 313 of Title III of SARA; fertilizers; pesticides; and waste products such as ashes, slag, and sludge that have the potential to be released with storm water discharges" (40 CFR 122.26(b)(12)). Significant materials commonly found at furniture and

fixture manufacturing facilities include: Wood; saw dust; metals; petroleum-based products; solvents; detergents; and waste materials.

Manufacturers of furniture and fixtures are separated by the primary raw material (i.e., wood and metal). The primary raw materials, industrial processes, waste and by-products, and final products differ for the production of wood furniture and metal furniture. Within each subsector the number of industrial activities and corresponding significant materials and waste products may also vary. Presented below are brief descriptions of the industrial activities and significant materials associated with the manufacturing of wood and metal furniture and fixtures. Due to similarities in the production of furniture and fixtures within subsectors, industrial activities and significant materials are fairly uniform across this sector. Unique practices are noted.

a. Manufacturing of wood furniture and fixtures. The process of manufacturing wood furniture begins with the delivery and storage of wood. There are three different raw wood materials; lumber, veneer, and particle board. Since the manufacturing processes are not typically exposed to storm water for this industry, some of the "industrial activities" described below may not be susceptible to storm water exposure. Significant materials and materials management practices do refer to those materials exposed to storm water, and to the subsequent management practices used to control storm water. Variations on exposure to industrial activities and significant materials are site-specific.

(1) *Industrial activities.* Once delivered, raw lumber is allowed to air dry up to 1 year. After the lumber is sufficiently air dried it is then transported to a dry kiln for further drying. The lumber is kiln dried anywhere from 7 to 150 days. Once the lumber has been dried to a desired moisture content, the dried lumber is taken to the processing area. The remaining furniture manufacturing processes are all completed indoors. Manufacturers may also receive lumber that is already dried. Therefore, the manufacturers may not need to air or kiln dry the wood and proceed directly into the processing stage.

The dried lumber is run through planers, to create a smooth, preliminary working surface, and then cut to specified dimensions depending on the end use. The sized lumber is then taken through sanding and machining operations. Sanding produces a smooth, fine working surface. Machining can include boring, routing, lathe

operations, mitre cutting, and finish cuts. From this point, each piece of wood is dedicated to a specific product.

Veneer is another raw material used in the production of furniture. In this process logs are placed in a steam vat to increase the moisture content of a log. The logs are turned on a lathe to peel off the veneer. The resulting veneer sheets are layered into stacks or "hacks." Moisture is removed from the hacks by kiln drying. After a desired moisture content has been achieved the hacks are disassembled. Veneer is frequently hot or cold pressed onto particle board or solid wood by utilizing adhesives.

Particle board is the third raw material incorporated into the manufacturing of wood furniture. The board is received, cut to size, and banded on all four edges with solid wood. The banding is accomplished in continuous, steam heated units utilizing adhesives. The panels are allowed to cool and then they are sanded. Particle board is frequently coated with veneer.

The products from the three raw materials may be combined during the machining and sanding step or during the final assembly of a furniture piece. The machining and sanding step may include: initial sizing of particle board, veneer, and lumber; laminating operations; and surface printing. Once all the pieces of a particular furniture item are manufactured and sized, assembly can begin. This process generally involves an assembly line routing with many different individuals and machines working together to build the unit.

The final step in creating an upholstered piece of furniture involves surface finishing. This process may involve many separate coats of stains, lacquers, sealers, and finishes to a single unit. This is the step where a uniform wood color and texture are given to each piece of furniture or furniture grouping.

Facilities that manufacture upholstered furniture may have all of the previously mentioned activities, or may purchase dried or sized materials from a manufacturer. Upholstered furniture manufacturers will transport, handle, store, and process natural and synthetic fibers used for the upholstery. After the wood component of an upholstered piece of furniture is assembled, the upholstery materials are cut, sized, stretched, and then attached to the frame. After the final inspection of a furniture piece, the unit is packaged and either stored temporarily onsite or immediately shipped to an offsite location.

(2) *Significant materials.* The significant materials identified, in part 1

of the group applications, as exposed to storm water at wood furniture and fixture manufacturing facilities include: Raw wood; sawdust; coal; kiln ash; solvent-based finishing materials and waste products; used rags; raw glue and waste materials; and petroleum-based products. While most of the raw wood material is stored outside, more valuable wood products (e.g., sheets of veneer, mahogany, etc.) and some composite wood products (e.g., particle board) may be stored inside or under cover.

b. Manufacturing of metal furniture and fixtures. Many furniture and fixture manufacturing facilities build their furniture with metal as the primary raw material. However, some manufacturers combine wood and upholstered materials with a metal frame. Metal furniture manufacturing facilities may purchase wood pieces ready for assembly or they may have all the industrial activities of wood manufacturing facilities in addition to the metal manufacturing facilities. The industrial activities at metal furniture manufacturing facilities will be site-specific and depend upon the level of work necessary to shape and treat the delivered metal into a furniture piece.

(1) Industrial activities. Facilities that manufacture metal household furniture maintain all operations including: Machining and assembly; finishing; and temporary storage of finished products within an enclosed building. Cold roll steel is initially received and temporarily stored within the manufacturing building. However, steel may be stored outside prior to use. The steel is cut to size, bent, and welded to design specifications to fabricate raw metal household furniture. Final grinding, sending, finishing, spot welding, and painting are then

completed. After the final inspection of a furniture piece, the unit is packaged and either stored temporarily onsite or immediately shipped to an offsite location.

(2) Significant materials. The significant materials identified as exposed to storm water, in part 1 of the group applications, at metal furniture and fixture facilities include: Metals; sawdust; solvent-based finishing materials and waste products; electroplating solutions and sludges; used rags; raw glue and waste materials; and petroleum-based products. The raw metal may be stored outside, exposed to storm water prior to manufacturing, but will be brought indoors for manufacturing.

3. Pollutants in Storm Water Discharges Associated With Furniture and Fixtures Manufacturing Facilities

Few pollutants are expected in storm water discharges from the manufacturing of wood and metal furniture and fixtures because the majority of the industrial activities occur indoors. Pollutants may be present in storm water as a result of outdoor activities associated with the manufacturing of wood and metal furniture and fixture such as: Material handling operations; waste disposal; raw material storage; and deposition of airborne particulate matter. In addition, sources of pollutants other than storm water, such as illicit connections, spills, and other improperly dumped materials, may increase the pollutant loadings discharged into waters of the United States.

Many of the part 2 group application data submittals did not identify individual site characteristics or sources of storm water pollutants which may be responsible for pollutant loadings. In

addition, the limited response from sampling facilities did not allow for a separation of sampling data submitted by wood and metal manufacturing facilities. Therefore, the only option available to EPA was to use the data in the aggregate.

EPA has identified the storm water pollutants and sources resulting from furniture and fixture manufacturing facilities in Table W-1. Table W-1 identified several pollutants including total suspended solids (TSS), oil and grease, and chemical oxygen demand (COD) as pollutants of concern at furniture and fixture manufacturing facilities.

Table W-2 indicates the sampling data results, for Section VII-A of Form 2F, from 18 of the sampling facilities required to submit data. This table indicates the minimum and maximum values, means, medians, 95th percentiles, 99th percentiles, and the total number of outfalls sampled for each of the pollutants. Variations in the minimum and maximum values were found to be small, relative to other industrial sectors in today's proposed permit for the eight conventional pollutants. The range in values, means, and medians for the conventional pollutants sampled were typically low. However, upon review of additional sampling data submitted to EPA after Table W-2 was compiled, EPA has found the additional data not to be outside the values listed in Table W-2.

Data submitted for arsenic, cadmium, copper, lead, nickel, and zinc were measured at less than 10 ppb for those facilities submitting data. Few facilities submitted sampling data for these constituents, indicating that facility operators did not anticipate loadings greater than 10 ppb.

TABLE W-2.—STATISTICS FOR CONVENTIONAL POLLUTANTS IN STORM WATERⁱ (mg/L, except as noted)

| Pollutant Sample type | No. of samples | | Mean | | Minimum | | Maximum | | Median | | 95th Percentile | | 99th Percentile | |
|----------------------------------|----------------|--------------------|------|------|---------|------|---------|-------|--------|-------|-----------------|-------|-----------------|-------|
| | Grab | Comp ⁱⁱ | Grab | Comp | Grab | Comp | Grab | Comp | Grab | Comp | Grab | Comp | Grab | Comp |
| BOD ₅ | 25 | 24 | 12.2 | 8.8 | 0.0 | 0.0 | 46.0 | 32.0 | 9.0 | 6.0 | 44.0 | 26.0 | 46.0 | 32.0 |
| COD | 25 | 24 | 96.0 | 76.3 | 0.0 | 0.0 | 300.0 | 240.0 | 83.0 | 72.5 | 230.0 | 180.0 | 300.0 | 240.0 |
| Nitrate + nitrite nitrogen | 25 | 24 | 1.73 | 1.51 | 0.0 | 0.0 | 12.0 | 10.0 | 0.9 | 0.675 | 6.2 | 5.6 | 12.0 | 10.0 |
| Total kjeldahl nitrogen | 25 | 24 | 4.37 | 4.4 | 0.0 | 0.6 | 46.0 | 55.0 | 1.7 | 1.350 | 15.0 | 13.0 | 46.0 | 55.0 |
| Oil & grease | 25 | N/A | 3.8 | N/A | 0.0 | N/A | 33.0 | N/A | 0.0 | N/A | 14.0 | N/A | 33.0 | N/A |
| pH (s.u.) | 23 | N/A | N/A | N/A | 4.2 | N/A | 9.3 | N/A | N/A | N/A | N/A | N/A | N/A | N/A |
| Total phosphorus | 25 | 24 | 0.27 | 0.26 | 0.0 | 0.0 | 1.1 | 1.3 | 0.2 | 0.185 | 0.89 | 0.71 | 1.1 | 1.3 |
| Total suspended solids | 25 | 24 | 188 | 143 | 3 | 2 | 891 | 900 | 130 | 91 | 440 | 550 | 891 | 900 |

ⁱ Applications that did not report the units of measurement for the reported values of pollutants were not included in these statistics.ⁱⁱ Composite samples.

Below is a discussion of the pollutants of concern:

- **Chemical oxygen demand (COD)**—COD measures the total amount of oxygen necessary for oxidation. COD is an effective indicator of levels of biologically resistant organic substances. Higher COD levels, for example, may be attributed to the presence of biologically resistant organics, such as oil and grease. COD data submitted in the part 2 applications from wood and metal furniture and metal manufacturing facilities indicate the following:

- The mean concentrations for grab and composite samples were 96.0 mg/L and 76.3 mg/L, respectively
- The median concentrations for grab and composite samples were 83.0 mg/L and 72.5 mg/L, respectively
- The 95th percentile concentration (i.e., 95 percent of the values are below) for grab and composite samples were approximately 230 mg/L and 180 mg/L, respectively.
- The 99th percentile concentration (i.e., 99 percent of the values are below) for grab and composite samples were 300 mg/L and 240 mg/L, respectively.

These mean and median COD concentrations are within the recommended load estimates storm water runoff from residential and commercial areas.¹²⁴ Therefore, EPA does not believe it is necessary to impose continued monitoring of COD.

- **Oil and grease**—There are several sources of oil and grease from wood and metal furniture and fixture manufacturing facilities. These sources include unloading/loading areas; vehicle/equipment maintenance and cleaning; and outdoor storage of vehicles, equipment and castings. Oil and grease emulsions are detrimental to aquatic organisms and inhabitants because: (1) deposition of oil and grease in bottom sediments can serve to inhibit normal benthic growths, impacting the aquatic food chain; (2) oil and grease emulsion may destroy algae or other plankton; (3) oil and grease emulsions may adhere to the gills of fish exerting a toxic effect to fish; and (4) water insoluble components damage the plumage and coats of aquatic animals and fowls. Floating oil may reduce the re-aeration of the water surface, and in conjunction with emulsified oil, may interfere with photosynthesis. In addition to environmental impacts, oil and grease impact the aesthetic qualities of water by forming unsightly surface

slicks that affect water beaches and shorelines.

Oil and grease data submitted in part 2 applications for wood and metal furniture and fixture manufacturing facilities indicate the following:

- The mean concentration was 3.8 mg/L
- The median concentration was 0.0 mg/L
- The 95th percentile concentration (i.e., 95 percent of the values are below) was 14 mg/L
- The 99th percentile concentration (i.e., 99 percent of the values are below) was 33 mg/L.

The most stringent storm water effluent guidelines establish a limit of 15 mg/L of oil and grease in a discharge.¹²⁵ The part 2 data indicates that the mean and median concentration of oil and grease are below this limit and, therefore, EPA does not believe it is necessary to impose continued monitoring for oil and grease.

- **pH**—pH is a measure of the acidity or alkalinity of a discharge. On the pH scale ranging from zero to fourteen, a value of seven represents neutral conditions in which the concentrations of hydrogen and hydroxyl ions are equal. Values of pH less than seven represent acidic conditions; values greater than seven represent basic conditions.

The pH level is easily measured and is an indication of potential environmental impacts. Storm water discharges with pH values markedly different from the pH values of the receiving stream are potentially detrimental to the environment. At outfalls and prior to complete mixing of storm water discharges with receiving waters, a zone of sudden pH change can damage or kill biota engulfed in the zone of change. Part 2 applications from wood and metal furniture and fixture manufacturing facilities indicated that less than 5 percent of the sampling facilities reported a pH below 6 standard units.

Data submitted for part 2 of the application indicate that pH levels are generally inside the permitted range for wastewater discharges under effluent limitation guidelines. Therefore, EPA does not believe continued monitoring for pH is justified.

- **Total Suspended Solids (TSS)**—TSS is associated with wood and metal furniture and fixture manufacturing facilities because some sites have exposure to significant materials like coal piles and refuse piles. Many part 2 applications have indicated the source

of high TSS levels to be coal pile runoff and runoff from refuse piles. Suspended solids increase the turbidity of water allowing less light to penetrate the water, thereby reducing photosynthetic activity of aquatic vegetation. Over time, total suspended solids settle out to form deposits that can be detrimental to stream environments. These deposits may destroy fauna that breed and grow in or near the bottoms of streams and serve as food for fish and other aquatic life. The deposits can also blanket and destroy spawning grounds for fish. TSS data submitted in the part 2 applications for wood and metal furniture and fixture manufacturing facilities indicate the following:

- Approximately 4 percent of the sampling facilities reported TSS levels above 450 mg/L
- The mean concentrations for grab and composite samples were 188 mg/L and 143 mg/L, respectively
- The median concentrations for grab and composite samples were 130 mg/L and 91 mg/L, respectively
- The 95th percentile concentration (i.e., 95 percent of the values are below) for grab and composite samples were 440 and 550, respectively
- The 99th percentile concentration (i.e., 99 percent of the values are below) for grab and composite samples were 891 mg/L and 900 mg/L, respectively.

The mean and median concentrations for TSS are inside the recommended load estimates for runoff from residential and commercial areas.¹²⁶ The high TSS levels have been found to be associated with facilities that indicated the primary source of TSS to be coal pile runoff and runoff from refuse piles. Since these sources of storm water contamination are addressed elsewhere in today's permit, the primary source of high TSS levels will be controlled regardless of the conditions within this section of today's permit. Therefore, EPA does not believe that continued monitoring for TSS is necessary.

- **Heavy metals**—EPA is not proposing to require monitoring of metals by facilities covered under today's proposed permit. As required by 40 CFR 122.26(g) (ii) and (iii), group applicants were only required to sample for metals if the facility knew or had reason to believe it would be expected in the discharge. Few facilities submitted data on heavy metals even though the discharges were less than 10 ppb. EPA considers any high heavy metals values to be atypical of those

¹²⁴ EPA, December 1983. "Results of the National Urban Runoff Program."

¹²⁵ Per 40 CFR Part 419.

¹²⁶ EPA, December 1983. "Results of the Nationwide Urban Runoff Program."

experienced by the majority of wood and metal furniture and fixture manufacturing facilities. Therefore, EPA does not believe it is necessary to impose monitoring conditions for heavy metals.

4. Options for Controlling Storm Water Pollutants

Certain BMPs are implemented to prevent and/or minimize exposure of pollutants from industrial activities to storm water discharges. EPA believes the most effective BMPs for reducing pollutants in storm water discharges are exposure minimization practices. Exposure minimization practices lessen the potential for storm water to come into contact with pollutants. Good housekeeping practices ensure that facilities are sensitive to routine and nonroutine activities which may increase pollutants in storm water discharges. The BMPs which address good housekeeping and exposure minimization are easily implemented,

inexpensive, and require little, if any, maintenance. BMP expenses may include construction of roofs for storage areas or other forms of permanent cover and the installation of berms/dikes. Other BMPs such as detention/retention ponds and filtering devices may be needed at these facilities because of the contaminant level in the storm water discharges.

Part 1 group application data indicate that few BMPs have been implemented at wood and metal furniture and fixture manufacturing facilities. The only BMPs identified in the part 1 applications include: closed tanks, drums, and metal boxes; and partial covering. The part 1 data submissions did not indicate the presence of any traditional BMPs, such as sedimentation and retention ponds, or diversion dikes. However, the group application process did not require a description, or identification, of traditional BMPs, only the identification of material management practices that

limit the contact between storm water and significant materials.

Because BMPs described in the part 1 data are limited, EPA is providing an overview of supplementary BMPs for use at furniture and fixture manufacturing facilities. However, inclusion of a BMP cited does not preclude the use of other viable BMP options. Table W-3 summarizes BMP options as they apply to wood and metal furniture and fixture manufacturing facilities. Sources of BMP information include: "Sediment and Erosion Control: An Inventory of Current Practices—Draft," EPA, April 20, 1990; "Storm Water Management for Industrial Activities: Developing Pollution Prevention Plans and Best Management Practices," EPA, September 1992 (EPA 832-R-92-006); and "Erosion & Sediment Control Handbook," Goldman et al., McGraw-Hill Book Company, 1986.

TABLE W-3.—STORM WATER BMPs FOR FURNITURE AND FIXTURE MANUFACTURING FACILITIES

| Activity | Best management practices (BMPs) |
|---|---|
| Outdoor unloading and loading | Confine loading/unloading activities to a designated area. Perform all loading/unloading activities in a covered or enclosed area. Close storm drains during loading/unloading activities in surrounding areas. Avoid loading/unloading materials in the rain. Inspect all containers prior to loading/unloading of any raw or spent materials. Berm, curb, or dike loading/unloading areas. Use dry clean-up methods instead of washing the areas down. Train employees on proper loading/unloading techniques. Confine storage of raw materials, parts, and equipment to designated areas. |
| Outdoor material storage (including waste and particulate emission management). | Train employees on proper waste control and disposal. Berm, curb, or dike any areas around tanks. Ensure that all containers are properly sealed and valves closed. Inventory all raw and spent materials. Inspect air emission control systems regularly, and repair or replace when necessary. Store wastes in covered, leakproof containers (e.g., dumpsters, drums). Store wastes in enclosed and/or covered areas. Ensure hazardous and solid waste disposal practices are performed in accordance with applicable Federal, State, and local requirements. Ship all wastes to offsite landfills or treatment facilities. |

Sources: NPDES Storm Water Group Applications—Part 1. Received by EPA, March 18, 1991, through December 31, 1992, and EPA, Office of Water, September 1992. "Storm Water Management for Industrial Activities: Developing Pollution Prevention Plans and Best Management Practices." EPA 832-R-92-006.

Many of the BMPs identified in Table W-3 are reminders of good or preferred operating procedures that are intended to limit the exposure of significant materials and industrial activities to storm water. Facility operators should review their current operations and consider implementing these BMPs if they are applicable to the site and reduce storm water contamination.

Since none of the facilities within the wood and metal furniture and fixture manufacturing sector indicated the presence of traditional storm water management practices, EPA is requiring

the participants of this sector to consider the implementation of storm water diversions and sediment control and collection structures.

Discharge diversions provide the first line of defense in preventing the contamination of discharges, and subsequent contamination of receiving waters of the United States. Discharge diversions are temporary or permanent structures installed to divert flow, store flow, or limit storm water runoff and runoff.

These diversion practices have several objectives. First, diversion structures

can be designed to prevent otherwise uncontaminated (or less contaminated) water from crossing disturbed areas or areas containing significant amounts of contaminated materials, where contact may occur between runoff and significant materials. These source reduction measures may be particularly effective for preventing uncontaminated discharges from contacting exposed materials and/or reduce the flow across disturbed areas, thereby lessening the potential for erosion. Second, diversion structures can be used to collect or divert waters for later treatment, if

necessary. The usefulness of these control measures are limited by such factors as the size of the area to be controlled and the type and nature of materials exposed and precipitation events.

Diversion dikes, curbs, and berms are temporary or permanent diversion structures that prevent runoff from passing beyond a certain point, and divert runoff away from its intended path. Dikes, curbs or berms may be used to surround and isolate areas of concern at wood and metal furniture manufacturing facilities, and divert flow around piles of significant materials in order to minimize or limit offsite discharges of contaminated storm water.

Sediment control and collection limits movement and retains sediments from being transported offsite. Several structural collection devices have been developed to remove sediment from runoff before it leaves the site. Several methods of removing sediment from site runoff involve diversion mechanisms previously discussed, supplemented by a trapping or storage device. Structural practices typically involve filtering diffuse storm water flows through temporary structures such as straw bale dikes, silt fences, brush barriers or vegetated areas.

However, structural practices require periodic removal of sediment to remain functional, for both temporary and permanent structures. As such, they serve as more active-type practices which may not be appropriate for permanent use at inactive mines. However, these practices may be effectively used as temporary measures during active operation and/or prior to the final implementation of permanent measures. Temporary structures include: plastic matting, plastic netting, and erosion control blankets; mulch-straw or wood chips; and compaction. Permanent sediment control and collection structures include: sediment/settling ponds; sediment traps or catch basins; and vegetated buffer strips.

5. Storm Water Pollution Prevention Plan Requirements

All facilities subject to this section must prepare and implement a storm water pollution prevention plan. The establishment of a pollution prevention plan requirement reflects EPA's decision to allow operators of furniture and fixture manufacturing facilities to utilize BMPs as the BAT/BCT level of control for the storm water discharges covered by this section. The requirements included in pollution prevention plans provide a flexible framework for the development and implementation of site-specific controls

to minimize pollutants in storm water discharges. This approach is consistent with the approach used in the baseline general permits finalized on September 9, 1992 (57 FR 41236). EPA believes that pollution prevention is the most effective approach for controlling contaminated storm water discharges from furniture and fixture manufacturing facilities. Pollution prevention plans allow the operator of a facility to select BMPs based on site-specific considerations such as: facility size; climate; geographic location; geology/hydrology; the environmental setting of each facility; volume and type of discharge generated, and current BMPs. This flexibility is necessary because each facility will be unique in that the source, type, and volume of contaminated surface water discharges will differ from site to site.

There are two major objectives to a pollution prevention plan: (1) to identify sources of pollution potentially affecting the quality of storm water discharges associated with an industrial activity from a facility; and (2) to describe and ensure implementation of practices to minimize and control pollutants in storm water discharges associated with industrial activity from a facility. Specific requirements for a pollution prevention plan for furniture and fixture manufacturing facilities are described below. These requirements must be implemented in addition to the pollution prevention plan provisions discussed previously, or any other industry-specific requirements to which the facility is subject. For example, facilities with coal piles must comply with the provisions for coal pile runoff, as well as the pollution prevention requirements for the furniture and fixture manufacturing industry.

a. Description of potential pollution sources. Under the drainage requirements, the site map must show areas where the following activities, if applicable, take place: Fueling; vehicle and equipment maintenance and/or cleaning; loading and unloading; material storage (including tanks or other vessels used for liquid or waste storage); outdoor material processing; waste treatment, storage, or disposal; haul roads; access roads; and rail spurs.

b. Measures and controls. Following completion of the source identification and assessment phase, the permittee must evaluate, select, and describe the pollution prevention measures, BMPs, and other controls that will be implemented at the facility. The permittee must assess the applicability of the following categories of BMPs for their site: discharge diversions, drainage/storm water conveyance

systems, runoff diversions, and good housekeeping measures. In addition, BMPs include processes, procedures, schedules of activities, prohibitions on practices, and other management practices that prevent or reduce the discharge of pollutants in storm water runoff.

The pollution prevention plan must discuss the reasons each selected structural control or BMP is appropriate for the facility and how each will address the potential sources of storm water pollution. The plan also must include a schedule specifying the time or times during which each control or practice will be implemented. In addition, the plan should discuss ways in which the controls and practices relate to one another and, when taken as a whole, produce an integrated and consistent approach for preventing or controlling potential storm water contamination problems.

Under the preventive maintenance requirements of the pollution prevention plan, permittees are required to develop a preventive maintenance program that includes regular inspections and maintenance of storm water BMPs. The maintenance program requires periodic removal of debris from discharge diversions and conveyance systems. These activities should be conducted in the spring, after snowmelt, and during the fall season. Permittees already controlling their storm water runoff with impoundments or sedimentation ponds must include the maintenance schedules for these ponds in the pollution prevention plan.

Under the inspection requirements of the pollution prevention plan, operators of furniture and fixture manufacturing facilities are required to conduct quarterly visual inspections of BMPs and materials loading/unloading areas. The inspections shall include: (1) An assessment of the integrity of storm water discharge diversions, conveyance systems, sediment control and collection systems, and containment structures; (2) visual inspections of vegetative BMPs to determine if soil erosion has occurred; and (3) visual inspections of material handling and storage areas and other potential sources of pollution for evidence of actual or potential pollutant discharges of contaminated storm water.

The visual inspections of BMPs and loading/unloading areas must be made at least once in each designated period during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event. Visual inspections shall be conducted in each of the following periods: December to February (storm water runoff or snow

melt); March to May (storm water runoff); June to August (storm water runoff); September to November (storm water runoff or snow melt). Visual inspections shall be conducted within the first 60 minutes of when the runoff begins discharging. Results from the visual inspection must be maintained onsite and include the examination date, time, and the name of personnel conducting the visual inspection.

EPA believes that this quick and simple description will allow the permittee to assess the effectiveness of his/her plan on a regular basis at very little cost. The examination will provide meaningful results upon which the facility may act quickly. The frequency of this visual inspection will also allow for timely adjustments to be made to the pollution prevention plan. If a BMP is found to be ineffective, corrective action must be implemented. A set of tracking or follow-up procedures must be used to ensure that appropriate actions are taken in response to the inspections. The visual examination is intended to be performed by facility staff. This hands on inspection will also enhance the staff's understanding of the storm water problems on that site and effects on the management practices that are included in the plan.

Under the recordkeeping and internal reporting procedures of the pollution prevention plan, the permittee must describe procedures for developing and retaining records on the status and effectiveness of plan implementation. The plan must address spills, monitoring (if applicable), and BMP inspection and maintenance activities. Ineffective BMPs must be recorded and the date of their corrective action noted. According to the pollution prevention plan requirements, the permittee must evaluate the appropriateness of each storm water BMP that diverts, infiltrates, reuses, or otherwise reduces the discharge of contaminated storm water. In addition, the permittee must describe the storm water pollutant source area or activity (i.e., loading and unloading operations, raw material storage piles etc.) to be controlled by each storm water management practice.

6. Monitoring and Reporting Requirements

a. Monitoring requirements. The regulatory modifications at 40 CFR 122.44 (i)(2) established on April 2, 1992, grant permit writers the flexibility to reduce monitoring requirements in storm water discharge permits. EPA has determined that the potential for storm water discharges to contain pollutants above benchmark levels, because of the industrial activities and materials

exposed to precipitation, does not support sampling at facilities covered by this section of today's permit. Based on a consideration of the nature of BMPs typically used at these facilities, and generally low pollutant values from the application data, EPA believes that the pollution prevention plan with visual observations of storm water discharges will help to ensure storm water contamination is minimized. Because permittees are not required to conduct sampling, they will be able to focus their resources on developing and implementing the pollution prevention plan.

Quarterly visual inspections of a storm water discharge from each outfall are required at wood and metal furniture and fixture manufacturing facilities. The inspection must be of a grab sample collected from each storm water outfall. The examination of storm water grab samples shall include any observations of color, odor, turbidity, floating solids, foam, oil sheen, or other obvious indicators of storm water pollution. The inspection must be conducted in a well lit area. No analytical tests are required to be performed on these samples.

The examination must be made at least once in each designated period during daylight hours unless there is insufficient rainfall or snow melt to runoff. EPA expects that, whenever practicable, the same individual will carry out the collection and examination of discharges throughout the life of the permit to ensure the greatest degree of consistency possible. Examinations shall be conducted in each of the following periods for the purposes of inspecting storm water quality associated with storm water runoff and snow melt: December to February; March to May; June to August; September to November. Grab samples shall be collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 60 minutes) of when the runoff begins discharging. Reports of the visual observation include: the examination date and time, examination personnel, visual quality of the storm water discharge, and probable sources of any observed storm water contamination. The visual observation reports must be maintained onsite with the pollution prevention plan.

EPA believes that this quick and simple assessment will help the permittee to determine the effectiveness of his/her plan on a regular basis at very little cost. Although the visual examination cannot assess the chemical properties of the storm water discharged from the site, the examination will provide meaningful results upon which

the facility may act quickly. The frequency of this visual inspection will also allow for timely adjustments to be made to the plan. If BMPs are performing ineffectively, corrective action must be implemented. A set of tracking or follow-up procedures must be used to ensure that appropriate actions are taken in response to the inspections. The visual examination is intended to be performed by members of the pollution prevention team. This hands on inspection will enhance the staff's understanding of the storm water problems on that site and effects of the management practices that are included in the plan.

When a discharger is unable to collect samples over the course of the monitoring period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

As discussed above, EPA does not believe that monitoring is necessary for wood and metal furniture and fixture manufacturing facilities. EPA believes that between quarterly visual inspections and site compliance evaluations potential sources of contaminants can be recognized, addressed and then controlled with BMPs. In determining the monitoring requirements, EPA considered the nature of the industrial activities and significant materials exposed at these sites, and performed a review of data provided in part 2 group applications.

X. Storm Water Discharges Associated With Industrial Activity From Printing and Publishing Facilities

On November 16, 1990 (55 FR 47990) EPA promulgated the regulatory definition of "storm water discharge associated with industrial activity." This definition includes point source discharges of storm water from eleven categories of facilities, including "... category (xi) facilities classified as Standard Industrial Classification (SIC) code . . . 27." Under this SIC code, facilities eligible for coverage under this section include:

- Book Printing (SIC Code 2732).
- Commercial Printing, Lithographic (SIC Code 2752).
- Commercial Printing, Gravure (SIC Code 2754).

- Commercial Printing, Not Elsewhere Classified (SIC Code 2759).
- Platemaking and Related Services (SIC Code 2796).

This section establishes special condition for storm water discharges associated with industrial activities at printing and publishing facilities. The SIC codes of these facilities are in category (xi) of the definition of storm water discharges associated with industrial activity. Storm water discharges from facilities in this category are only regulated where precipitation and storm water runoff come into contact with areas associated with industrial activities, and significant materials. Significant materials include, but are not limited to, raw materials, waste products, finished products, intermediate products, by-products, and other materials associated with industrial activities.

When an industrial facility, described by the above eligibility provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

If monitoring and pollution prevention plan requirements of another industrial activity section of this permit apply to co-located industrial activities at an industrial facility, the eligibility provisions of that industrial activity section shall not preclude the operator of the industrial facility from complying with the applicable monitoring and pollution prevention plan requirements of that section.

1. Industry Profile

The printing and publishing industry is composed of a heterogeneous collection of over 38,000 companies that range in size from a few employees to several thousand.¹²⁷ Some companies are involved in both printing and publishing, while others are exclusively one or the other. The industrial

activities of these facilities are similar, but the finished products vary. The finished products include magazines, newspapers, books, and labels. The printing activities covered under this section occur strictly indoors, and are separated into distinct operations. They include book printing, commercial printing (lithographic and gravure), and platemaking for printing purposes. The lithographic printing operation, which is based on the premise that grease and water do not mix, consists of a printing plate or cylinder, ink, a blanket and paper. Areas on the printing plate which will be transferred are coated with grease, and the rest of the plate is kept moist with water. The ink adheres to the grease and is repelled by the water. The printing image is then transferred to a blanket, which is transferred to paper. The gravure printing process uses printing plates or cylinders, ink, and paper. In the gravure process, the image is engraved on the printing plate or cylinder, the ink is then picked up by the engraved cells and directly transferred to paper. Other printing methods include screen, letter press, and flexographic printing. In the platemaking process, plates are cut from metal (usually steel), formed, engraved with the image, and coated with copper sulfate or chromic acid. The plates are later used in the printing processes described above.

Aside from the specific printing activities, other types of industrial activities are shared by facilities covered under this section. For example, the majority of these facilities have outdoor material handling and storage activities, and share the same types of raw and waste materials.

The primary raw materials utilized by this industry group include paper (including wax paper and card stock at some facilities), printing inks (hydrocarbon based, solvent based), and solvents. Other raw materials include steel (for facilities which manufacture printing plates), toner, paints, lubricating fluids, fuels, coating materials, and adhesives/glues. The paper products are stored indoors because exposure to precipitation would destroy the quality. The other raw materials arrive at the facilities in drums and either remain in the drums or are stored in aboveground or underground tanks, depending on the facilities' space and primary activity. The outdoor storage areas for drums are sometimes covered, but when the drums are directly exposed to precipitation, the storage areas are diked. Within the facilities, drums are stored on wooden pallets or skids, which may become contaminated from spills of the stored

materials. After use the pallets and skids are stored outside for disposal and have the potential to contaminate storm water discharges.

The wastes produced from the printing process are both nonhazardous and hazardous. Hazardous wastes including ink-wastes, solvent wastes, and waste chromic and sulfuric acid. These wastes are generated in small quantities at some of the facilities within this industrial group. Solvent wastes result from cleaning of printing plates and metal cutting operations. Ink wastes are generated from the cleaning of printing plates and from excess ink used in printing. Chromic and sulfuric acid wastes are generated from facilities which manufacture and coat rotogravure printing plates.

Nonhazardous wastes from this industry group include waste paper, paper dust, scrap steel, and used wooden pallets. All of these waste materials have the potential to pollute storm water discharges.

Significant materials exposed to storm water at these facilities consist of raw materials and waste materials. They include solvents (toluene, xylene, acetone, 1,1,1-trichloroethane), fuels (gasoline and diesel), inks, metal, lubricating oils, pallets, copper, chromium, acids (sulfuric and chromic), oil and grease, and waste paper. Some of these materials are directly exposed to storm water, while others are potentially exposed due to covering. Pollutants of concern include TSS, pH, heavy metals, oil and grease, and COD.

Material handling activities such as loading and unloading areas, and liquid transfer (solvents from outdoor storage tanks to facility) may be exposed to storm water discharges. Exposure of these areas to storm water may be minimized by covering of the shipping/receiving and liquid transfer areas.

For those facilities engaged in fueling and vehicle maintenance, gasoline and diesel fuel are frequently stored outdoors in aboveground storage tanks and drums. Most vehicles and equipment require oil, hydraulic fluids, antifreeze, and other fluids that may leak and contaminate storm water discharges.

2. Pollutants Found in Storm Water Discharges From Printing and Publishing Facilities

The impact of industrial activities on storm water discharges at printing and publishing facilities will vary. Factors at a site which influence the water quality include geographic location, hydrogeology, the industrial activities exposed to storm water discharges, the facility's size, the types of pollution

¹²⁷ "Economic Analysis of Proposed Effluent Guidelines, Printing Industry." Office of Planning and Evaluation, EPA. August 1974.

prevention measures/best management practices in place, and the type, duration, and intensity of storm events. Taken together or separately, these factors determine how polluted the storm water discharges will be at a given facility. Additionally, pollutant sources

other than storm water, such as illicit connections,¹²⁸ spills, and other improperly dumped materials, may increase the pollutant loading discharged into Waters of the United States. Table X-1 lists industrial activities that commonly occur at

printing and publishing facilities, the pollutant sources at these facilities, and the pollutants associated with these activities. Table X-1 identifies heavy metals, oil and other parameters as potential pollutants of concern associated with printing and publishing facilities.

TABLE X-1.—DESCRIPTION OF INDUSTRIAL ACTIVITIES, POTENTIAL POLLUTANT SOURCES, AND ASSOCIATED POLLUTANTS i, ii, iii

| Activity | Pollutant source | Pollutant |
|---|---|---|
| Plate preparation | Using ink (lithography, letterpress, screen printing, flexography), etch baths, applying lacquer. | Solvent, Heavy metal, toxic waste ink with solvents chromium, lead. |
| Printing | Using ink (lithography, letterpress, screen printing, flexography), gravure. | Heavy metal waste (dust and sludge), Ink—sludges with chromium or lead, Ink—toxic wastes with metals, solvents. |
| Clean up | Used plates: type, die, press blankets and rollers | Ink—toxic wastes with metals, solvents. |
| Stencil preparation for screen printing. | Lacquer stencil film, photoemulsion, blockout (screen filler). | Solvents, photographic processing wastes. |
| Material handling: Transfer, storage, disposal. | Spills and leaks from material handling equipment ... | Fuel, oil, heavy metals. |
| | Spills and leaks from aboveground tanks | Fuel, oil, heavy metals, material being stored. |
| | Solvents; trash; petroleum products | Heavy metals, spent solvents, oil. |
| Photoprocessing | Developing negatives and prints | Heavy metals, spent solvents. |

ⁱⁱUniversity of Pittsburgh Trust, Center for Hazardous Materials Research Fact Sheet, Pollution Prevention: Strategies for the Printing Industry.

ⁱⁱⁱEPA, Resource Conservation and Recovery Act (RCRA) document, Does Your Business Produce Hazardous Waste as Many Small Businesses Do. Printing and Allied Industries, EPA/530-SW-90-027g, April 15, 1990.

Part 2 group application data that was statistically summarized indicated large variations in the minimum and maximum values reported for each of the eight conventional pollutants monitored:

- Oil and grease samples ranged from 0.0 mg/l to 98 mg/L.

- Grab sample values for Total Suspended Solids (TSS) ranged from 0.0 mg/l to 660 mg/L.

- Grab samples for Chemical Oxygen Demand (COD) ranged from 0.0 mg/l to 231 mg/L.

The remaining conventional pollutants sampled also varied in their minimum and maximum values; however, the values were typically low relative to other sectors in today's proposed permit. EPA believes that the high levels of pollutants at some facilities are atypical to those

experienced by the majority of printing and publishing facilities. Table X-2 shows the sampling results for the conventional pollutants that were statistically analyzed by EPA. This table lists the minimum and maximum values, means, medians, 95th percentiles, 99th percentiles, and the total number of samples analyzed for each of the conventional pollutants.

¹²⁸ Illicit connections are contributions of unpermitted non-storm water discharges to storm sewers from any number of sources including improper connections, dumping or spills from industrial facilities, commercial establishments, or

residential dwellings. The probability of illicit connections at facilities manufacturing transportation equipment, industrial or commercial machinery is low but it may be applicable at some operations.

TABLE X-2.—STATISTICS FOR CONVENTIONAL POLLUTANTS IN STORM WATER: (mg/L, except as noted)

| Pollutant Sample Type | # of Samples ¹ | | Mean | | Minimum | | Maximum | | Median | | 95th percentile | | 99th percentile | |
|----------------------------------|---------------------------|-------------------|------|------|---------|------|---------|-------|--------|-------|-----------------|-------|-----------------|-------|
| | Grab | Comp ^u | Grab | Comp | Grab | Comp | Grab | Comp | Grab | Comp | Grab | Comp | Grab | Comp |
| BOD ₅ | 27 | 27 | 11 | 7.0 | 0.0 | 0.0 | 61.8 | 24.0 | 9.0 | 6.4 | 49.0 | 22.2 | 61.8 | 24.0 |
| COD | 27 | 27 | 57.2 | 42.4 | 0.0 | 0.0 | 231.0 | 156.0 | 49.0 | 39.0 | 176.0 | 119.0 | 231.0 | 156.0 |

¹ Applicants that did not report the units of measurement for the reported values of pollutants were not included in these statistics.^u Composite samples.

3. Options for Controlling Pollutants.

In evaluating options for controlling pollutants in storm water discharges, EPA must achieve compliance with the technology-based standards of the Clean Water Act [Best Available Technology (BAT) and Best Conventional Technology]. The Agency does not believe that it is appropriate to establish specific numeric effluent limitations or a specific design or performance standard in this section for storm water discharges associated with industrial activity from facilities which manufacture transportation equipment, industrial or commercial machinery to meet BAT/BCT standards of the Clean Water Act. Instead, this section establishes requirements for the development and implementation of site-specific storm water pollution prevention plans consisting of a set of Best Management Practices (BMPs) that are sufficiently flexible to address different sources of pollutants at different sites.

Certain BMPs are implemented to prevent and/or minimize exposure of pollutants from industrial activities to storm water discharges. EPA believes the most effective BMPs for reducing pollutants in storm water discharges are

exposure minimization practices.

Exposure minimization practices lessen the potential for storm water to come into contact with pollutants. Good housekeeping practices ensure that facilities are sensitive to routine and nonroutine activities which may increase pollutants in storm water discharges. The BMPs which address good housekeeping and exposure minimization are easily implemented, inexpensive, and require little, if any, maintenance. BMP expenses may include construction of roofs for storage areas or other forms of permanent cover and the installation of berms/dikes. Other BMPs such as detention/retention ponds and filtering devices may be needed at these facilities because of the contaminant level in the storm water discharges. The types of BMPs implemented will depend on the type of discharge, types and concentrations of contaminants, and the volume of the flow.

The selection of the most effective BMPs will be based on site-specific considerations such as: Facility size, climate, geographic location, geology/hydrology and the environmental setting of each facility, and volume and type of discharge generated. Each facility will be unique in that the

source, type, and volume of contaminated storm water discharges will differ. In addition, the fate and transport of pollutants in these discharges will vary. EPA believes that the management practices discussed herein are well suited mechanisms to prevent or control the contamination of storm water discharges associated with printing and publishing facilities.

Part 1 group application data indicate that BMPs have not been widely implemented at the representative sampling facilities. Less than 10 percent of the sampling subgroup reported that they store some materials indoors; less than 10 percent store hazardous wastes under roof; and less than 5 percent cover drums or have sealed drums. However, 45 percent of the subgroup utilize some type of covering; 45 percent implement good housekeeping practices; and over 40 percent have training on pollution prevention.

The measures commonly used to reduce pollutants in storm water discharges associated with printing and publishing facilities are generally simple and easy to implement. Table X-3 identifies best management practices (BMPs) associated with different activities that routinely occur at printing and publishing facilities.

TABLE X-3.—GENERAL STORM WATER BMPs FOR PRINTING AND PUBLISHING FACILITIES^{i, ii, iii, iv}

| Activity | Best management practices (BMPs) |
|--|---|
| Plate preparation | Use aqueous-developed lithographic plates or wipe-on plates. |
| Printing | Use press wipes as long as possible before discarding or laundering; dirty ones for the first pass, clean ones for the second pass. Squeeze or centrifuge solvent out of dirty rags. Set up an in-house dirty rag cleaning operation if warranted or sent to approved industrial laundries, if available. Dedicated press for inks with hazardous pigments/solvents. Segregate used oil from solvents or other materials. Use water-based inks in gravure and flexographic printing process. |
| Clean up | Label sinks as to proper disposal of liquids. Keep equipment in good condition. Use doctor blades and squeegees to remove as much ink as possible prior to cleaning with solvent and rags. Control solvent use during equipment cleaning, use only what you need. Designate special areas for draining or replacing fluids. Substitute nontoxic or less toxic cleaning solvents. Recover waste solvents onsite with batch distillation if warranted or utilize professional solvent recyclers. Centralized liquid solvent cleaning in one location. Have refresher courses in operating and safety procedures. |
| Stencil preparation for screen printing. | Recapture excess ink from silkscreen process before washing the screen to decrease amount of ink used and cleaning emulsion used. |
| Material Handling and Storage Areas. | Store containerized materials (fuels, paints, inks, solvents, etc.) in a protected, secure location and away from drains. Store reactive, ignitable, or flammable liquids in compliance with the local fire code. Identify potentially hazardous materials, their characteristics, and use. Eliminate/reduce exposure to storm water. Control excessive purchasing, storage, and handling of potentially hazardous materials. Keep records to identify quantity, receipt date, service life, users, and disposal routes. Secure and carefully monitor hazardous materials to prevent theft, vandalism, and misuse of materials. Educate personnel for proper storage, use, cleanup, and disposal of materials. Maintain good integrity of all storage tanks. Inspect storage tanks to detect potential leaks and perform preventive maintenance. Provide sufficient containment for outdoor storage areas for the larger of either 10 percent of the volume of all containers or 110 percent of the volume of the largest tank. |

TABLE X-3.—GENERAL STORM WATER BMPs FOR PRINTING AND PUBLISHING FACILITIES^{i, ii, iii, iv}—Continued

| Activity | Best management practices (BMPs) |
|----------|--|
| | Use temporary containment where required by portable drip pans. Use spill troughs for drums with taps. Train employees on proper filling and transfer procedures. Inspect piping systems (pipes, pumps, flanges, couplings, hoses, valves) for failures or leaks. Handle solvents in designated areas away from drains, ditches, and surface waters. Locate designated areas preferably indoors or under a shed. If spills occur, • Stop the source of the spill immediately. • Contain the liquid until cleanup is complete. • Deploy oil containment booms if the spill may reach the water. • Cover the spill with absorbent material. • Keep the area well ventilated. • Dispose of cleanup materials properly. • Do not use emulsifier or dispersant. |

^{iv}NPDES Storm Water Group Applications—Part 1. Received by EPA March 18, 1991 through December 31, 1992.

4. Special Conditions

There are no additional requirements under this section other than those stated in VI.B. of today's fact sheet.

5. Storm Water Pollution Prevention Plan Requirements

EPA believes that pollution prevention is the most effective approach for controlling contaminated storm water discharges from printing and publishing facilities. The requirements included in the pollution prevention plans provide a flexible framework for the development and implementation of site-specific controls to minimize the pollutants in storm water discharges. This flexibility is necessary because each facility is unique in that the source, type, and volume of contaminated storm water discharge will vary from site to site.

Under today's proposed permit, all facilities must prepare and implement a storm water pollution prevention plan. The pollution prevention plan requirement reflects EPA's decision to allow operators of printing and publishing facilities to utilize BMPs as the BAT/BCT level of control for the storm water discharges covered by this section. The pollution prevention plan requirements in this section are consistent with EPA's storm water general permits finalized on September 9, 1992 (57 FR 41236), and September 25, 1992 (57 FR 44438), for discharges in nonauthorized NPDES States.

There are two major objectives to a pollution prevention plan: (1) To identify sources of pollution potentially affecting the quality of storm water discharges associated with industrial activity from a facility; and (2) to describe and ensure implementation of

practices to minimize and control pollutants in storm water discharges associated with industrial activity from a facility.

Specific requirements for a pollution prevention plan for printing and publishing facilities are described below. These requirements must be implemented in addition to the baseline pollution prevention plan provisions discussed previously.

a. Contents of the plan. Storm water pollution prevention plans are intended to aid operators of printing and publishing facilities to evaluate all potential prevention sources at a site, and assist in the selection and implementation of appropriate measures designed to prevent, or control, the discharge of pollutants in storm water runoff. EPA has developed guidance entitled Storm Water Management for Industrial Activities: "Developing Pollution Prevention Plans and Best Management Practices," EPA, 1992, (EPA 832-R-92-006) to assist permittees in developing and implementing pollution prevention measures.

(1) Description of potential pollutant sources. Each storm water pollution prevention plan must describe activities, materials, and physical features of the facility that may contribute pollutants to storm water runoff or, during periods of dry weather, result in dry weather flows. This assessment of potential storm water pollutant source will support subsequent efforts to identify and set priorities for necessary changes in materials, materials management practices, or site features, as well as aid in the selection of appropriate structural and nonstructural control techniques.

Plans must describe the following elements:

(a) Site map.—The plan must contain a map of the site that shows the pattern of storm water drainage, structural and nonstructural features that control pollutants in storm water runoff and process wastewater discharges, surface water bodies (including wetlands), places where significant materials¹²⁹ are exposed to rainfall and runoff, and locations of major spills and leaks that occurred in the 3 years prior to the effective date of this permit. The map must also indicate the direction of storm water flow. An outline of the drainage area for each outfall must be provided; and the location of each outfall and monitoring points must be indicated. An estimation of the total site acreage utilized for each industrial activity (e.g., storage of raw materials, waste materials, and used equipment) must be provided. These areas include liquid storage tanks, stockpiles, holding bins, used equipment, and empty drum storage. These areas are considered to be significant potential sources of pollutants at printing and publishing facilities.

¹²⁹ Significant materials include, "• • • but (are) not limited to: raw materials, fuels, materials such as solvents, detergents, and plastic pellets; finished materials such as metallic products; • • • hazardous substances designated under section 101(14) of CERCLA; any chemical facilities are required to report pursuant to section 313 of Title III of SARA; fertilizers; pesticides; and waste products such as ashes, slag, and sludge that have the potential to be released with storm water discharge." (40 CFR 122.26(b)(12)). Significant materials commonly found at transportation equipment, industrial or commercial machinery manufacturing facilities include raw and scrap metals; solvents; used equipment; petroleum based products; waste materials or by-products used or created by the facility.

(b) Inventory of exposed materials—Facility operators are required to carefully conduct an inspection of the site to identify significant materials that are or may be exposed to storm water discharges. The inventory must address materials that within 3 years prior to the effective date of this permit have been handled, stored, processed, treated, or disposed of in a manner to allow exposure to storm water. Findings of the inventory must be documented in detail in the pollution prevention plan. At a minimum, the plan must describe the method and location of onsite storage or disposal; practices used to minimize contact of materials with precipitation and runoff; existing structural and nonstructural controls that reduce pollutants in storm water; existing wastewater discharges; and any treatment the runoff receives before it is discharged to surface waters or through a separate storm sewer system. The description must be updated whenever there is a significant change in the type or amounts of materials, or material management practices, that may affect the exposure of materials to storm water.

(c) Significant spills and leaks—The plan must include a list of any significant spills and leaks of toxic or hazardous pollutants that occurred in the 3 years prior to the effective date of the permit. Significant spills include, but are not limited to, releases of oil or hazardous substances in excess of reportable quantities under Section 311 of CWA (see 40 CFR 110.10 and 117.21) or Section 102 of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) (see 40 CFR 302.4). Significant spills may also include releases of oil or hazardous substances that are not in excess of reporting requirements and releases of materials that are not classified as oil or a hazardous substance.

(d) Non-storm water discharges—Each pollution plan must include a certification, signed by an authorized individual, that discharges from the site have been tested or evaluated for the presence of non-storm water, the results of any test and/or evaluation conducted to detect such discharges, the test method or evaluation criteria used, the dates on which tests or evaluations were performed, and the onsite drainage points directly observed during the test or evaluation. Pollution prevention plans must identify and ensure the implementation of appropriate pollution prevention measures for any non-storm water discharges.

(e) Sampling data—Any existing data describing the quality or quantity of

storm water discharges from the facility must be summarized in the plan. The description should include a discussion of the methods used to collect and analyze the data. Sample collection points should be identified in the plan and shown on the site map.

(f) Summary of potential pollutant sources—The description of potential pollutant sources should clearly point to activities, materials, and physical features of the facility that have a reasonable potential to contribute significant amounts of pollutants to storm water. Any such activities, materials, or features must be addressed by the measures and controls subsequently described in the plan. In conducting the assessment, the facility operator must consider the following activities: raw materials (liquid storage tanks, stockpiles, holding bins), waste materials (empty drum storage), and used equipment storage areas. The assessment must list any significant pollutant parameter(s) (i.e., total suspended solids, oil and grease, etc.) associated with each source.

(2) Measures and controls. Permittees must select, describe, and evaluate the pollution prevention measures, BMPs, and other controls that will be implemented at the facility. Source reduction measures include preventive maintenance, spill prevention, good housekeeping, training, and proper materials management. If source reduction is not an option, EPA supports the use of source control measures. These include BMPs such as material covering, water diversion, and dust control. If source reduction or source control are not available, then recycling or waste treatment are other alternatives. Recycling allows the reuse of storm water, while treatment lowers pollutant concentrations prior to discharge. Since the majority of printing and publishing activities occurs indoors, the BMPs identified above are geared towards only those activities occurring outdoors or otherwise have a potential to contribute pollutants to storm water discharges.

Pollution prevention plans must discuss the reasons each selected control or practice is appropriate for the facility and how each of the potential pollutant sources will be addressed. Plans must identify the time during which controls or practices will be implemented, as well the effect the controls or practices will have on storm water discharges from the site. At a minimum, the measures and controls must address the following components:

(a) Good housekeeping—Permittees must describe protocols established to reduce the possibility of mishandling

chemicals or equipment and training employees in good housekeeping techniques. Specifics of this plan must be communicated to appropriate plant personnel.

(b) Preventive maintenance—Permittees are required to develop a preventive maintenance program that includes regular inspections and maintenance of storm water BMPs. Inspections should assess the effectiveness of the storm water pollution prevention plan. They allow facility personnel to monitor the components of the plan on a regular basis. The use of a checklist is encouraged, as it will ensure that all of the appropriate areas are inspected and provide documentation for recordkeeping purposes.

(c) Spill prevention and response procedures—Permittees are required to identify proper material handling procedures, storage requirements, containment or diversion equipment, and spill removal procedures to reduce exposure of spills to storm water discharges. Areas and activities which are high risks for spills at printing and publishing facilities include raw material unloading and product loading areas, material storage areas, and waste management areas. These activities and areas and their drainage points must be described in the plan.

(d) Inspections—Qualified personnel must inspect designated equipment and areas of the facility at the proper intervals specified in the plan. The plan should identify areas which have the potential to pollute storm water for periodic inspections. Records of inspections must be maintained onsite.

(e) Employee training—Permittees must describe a program for informing and educating personnel at all levels of responsibility of the components and goals of the storm water pollution prevention plan. A schedule for conducting this training should be provided in the plan. Where appropriate, contractor personnel must also be trained in relevant aspects of storm water pollution prevention. Topics for employee training should include good housekeeping, materials management, and spill response procedures.

(f) Recordkeeping and internal reporting procedures—Permittees must describe procedures for developing and retaining records on the status and effectiveness of plan implementation. This includes the success and failure of BMPs implemented at the facility.

(g) Sediment and erosion control—Permittees must identify areas, due to topography, activities, soils, cover materials, or other factors that have a

high potential for soil erosion. Measures to eliminate erosion must be identified in the plan.

(h) *Management of runoff*—Permittees must provide an assessment of traditional storm water management practices that divert, infiltrate, reuse, or otherwise manage storm water so as to reduce the discharge of pollutants. Based on this assessment, practices to control runoff from these areas must be identified and implemented as required by the plan.

(3) *Comprehensive site compliance evaluation*. The storm water pollution prevention plan must describe the scope and content of comprehensive site inspections that qualified personnel will conduct to: (1) Confirm the accuracy of the description of potential sources contained in the plan, (2) determine the effectiveness of the plan, and (3) assess compliance with the terms and conditions of this section. Comprehensive site compliance evaluations must be conducted once a year for printing and publishing facilities. The individual(s) who will conduct the inspections must be identified in the plan and should be members of the pollution prevention team. Inspection reports must be retained for at least 3 years after the date that the permit expires.

Based on the results of each inspection, the description of potential pollution sources, and measures and controls, the plan must be revised as appropriate within 2 weeks after each inspection. Changes in the measures and controls must be implemented on the site in a timely manner, never more than 12 weeks after completion of the inspection.

6. Numeric Effluent Limitation

There are no additional requirements under this section other than those stated in Part VI.F. of today's fact sheet.

7. Monitoring and Reporting Requirements

a. *Monitoring requirements*. The regulatory modifications at 40 CFR 122.44 (i)(2) established on April 2, 1992, grant permit writers the flexibility to reduce monitoring requirements in storm water discharge permits. EPA has determined that the potential for storm water discharges to contain pollutants above benchmark levels, because of the industrial activities and materials exposed to precipitation, does not support sampling at printing and publishing facilities. Based on a consideration of the BMPs typically used at these facilities, and generally low pollutant values from the application data, EPA believes that the

pollution prevention plan with visual observations of storm water discharges will help to ensure storm water contamination is minimized. Because permittees are not required to conduct sampling, they will be able to focus their resources on developing and implementing the pollution prevention plan.

Quarterly visual inspections of a storm water discharge from each outfall are required. The inspection must be of a grab sample collected from each storm water outfall. The examination of storm water grab samples shall include any observations of color, odor, turbidity, floating solids, foam, oil sheen, or other obvious indicators of storm water pollution. The inspection must be conducted in a well lit area. No analytical tests are required to be performed on these samples.

The examination must be made at least once in each designated period during daylight hours unless there is insufficient rainfall or snow-melt to runoff. EPA expects that, whenever practicable, the same individual should carry out the collection and examination of discharges throughout the life of the permit to ensure the greatest degree of consistency possible. Examinations shall be conducted in each of the following periods for the purposes of inspecting storm water quality associated with storm water runoff and snow melt: December to February; March to May; June to August; September to November. Grab samples shall be collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 60 minutes) of when the runoff begins discharging. Reports of the visual observation include: the examination date and time, examination personnel, visual quality of the storm water discharge, and probable sources of any observed storm water contamination. The visual observation reports must be maintained onsite with the pollution prevention plan.

EPA believes that this quick and simple assessment will help permittees to determine the effectiveness of their plan on a regular basis at very little cost. Although the visual examination cannot assess the chemical properties of the storm water discharged from the site, the examination will provide meaningful results upon which the facility may act quickly. The frequency of this visual inspection will also allow for timely adjustments to be made to the plan. If BMPs are performing ineffectively, corrective action must be implemented. A set of tracking or follow-up procedures must be used to ensure that appropriate actions are taken in response to the inspections.

The visual examination is intended to be performed by members of the pollution prevention team. This hands-on inspection will enhance the staff's understanding of the storm water problems on that site and the effects of the management practices that are included in the plan.

When a discharger is unable to collect samples over the course of the monitoring period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

As discussed above, EPA does not believe that chemical monitoring is necessary for printing and publishing facilities. EPA believes that between quarterly visual inspections and site compliance evaluations potential sources of contaminants can be recognized, addressed, and then controlled with BMPs. In determining the monitoring requirements, EPA considered the nature of the industrial activities and significant materials exposed at these sites, and performed a review of data provided in Part 2 group applications.

8. Alternative Monitoring Requirements

EPA requests comment upon the following monitoring and reporting requirements in lieu of those listed in Part XI.X.7. of today's proposed permit.

a. *Annual monitoring requirements*. During the period beginning on the effective date and lasting through the expiration date of this permit, permittees covered by this section must monitor for the storm water parameters identified in Table X-4. Monitoring should occur at least annually (once per year) except as provided in VI.E.7. (Sampling Waiver) and VI.E.6. (Representative Discharge). In addition to the parameters listed below, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event which generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

TABLE X-4.—STORM WATER DISCHARGE MONITORING REQUIREMENTS INCLUDING PARAMETERS, UNITS, FREQUENCY, AND SAMPLE TYPE

| Parameter | Unit | Frequency | Sample type ¹ |
|------------------------------------|----------------------|---------------|--------------------------|
| Total Flow | MGD | 1/year | Estimate. |
| Oil & Grease | mg/L |do | Grab. |
| Total Recoverable Zinc | mg/L |do | Do. |
| Total Suspended Solids (TSS) | mg/L |do | Do. |
| pH | Standard units |do | Do. |
| Total Recoverable Copper | mg/L |do | Do. |

¹ The grab sample shall be collected in the first 30 minutes of the discharge or as soon thereafter as practical, but not to exceed 60 minutes.

b. Sample type. All samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable.

c. Reporting: when to submit. Permittees that are required to conduct sampling pursuant to XLX.7.a. shall monitor samples collected during the sampling period from January to December. Such permittees shall submit monitoring results obtained during the reporting period running from January to December on Discharge Monitoring Report Form(s) postmarked no later than the 28th day of the following January. The first report may include less than 12 months of information.

Y. Storm Water Discharges Associated With Industrial Activity From Rubber, Miscellaneous Plastic Products, and Miscellaneous Manufacturing Industries

1. Discharges Covered Under This Section

This section covers storm water discharges associated with industrial activity from facilities commonly identified by Standard Industrial Classification (SIC) major groups 30 and 39 (except 391—jewelry, silverware, and plateware).

Major SIC group 30 includes rubber and miscellaneous plastic products. Specifically, this SIC group includes manufacturers of tires and inner tubes, rubber and plastic footwear, rubber and plastic hose and belting, gaskets, packing and sealing devices, and miscellaneous fabricated rubber products. This SIC group also includes miscellaneous plastic products such as unsupported plastic film, sheet, rods

and tubes, laminated plastic plate, sheet and profile shapes, plastic pipe and bottles, plastic foam products such as cups, ice chests and packaging materials, plastic plumbing fixtures, and miscellaneous plastic products.

Major SIC group 39 includes miscellaneous manufacturing industries. Specifically, this group includes manufacturers of jewelry and silverware, musical instruments, games, toys and athletic goods, pens, pencils and artists' supplies, buttons, pins and needles, and a wide variety of products not classified elsewhere.

The SIC codes of the facilities covered by this section are in category (xi) of the definition of storm water discharges associated with industrial activity. Storm water discharges from facilities in this category are only regulated where precipitation and storm water runoff come into contact with areas associated with industrial activities, and significant materials. Significant materials include, but are not limited to, raw materials, waste products, fuels, finished products, intermediate products, by-products, and other materials associated with industrial activities.

When an industrial facility, described by the above eligibility provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

If monitoring and pollution prevention plan requirements of another industrial activity section of this permit

apply to co-located industrial activities at an industrial facility, the eligibility provisions of that industrial activity section shall not preclude the operator of the industrial facility from complying with the applicable monitoring and pollution prevention plan requirements of that section.

2. Pollutants Found in Storm Water Discharges

a. Sources of pollutants. As discussed above, the SICs of the facilities in this sector fall into category (xi) of the definition of "storm water associated with industrial activity" found at 40 Code of Federal Regulations (CFR) 122.26(b)(14). As noted in the preamble to the final storm water regulations of November 16, 1990, most of the actual manufacturing and processing activity at these types of facilities normally occurs indoors (55 FR 48008).

Additional information concerning these manufacturing processes and the industrial sector itself can be found in the following documents:

- "Development Document for Effluent Limitations Guidelines and New Source Performance Standards for the Tire and Synthetic Rubber Processing Point Source Category," EPA 440/1-74-013a

- "Development Document for Effluent Limitations Guidelines and New Source Performance Standards for the Fabricated and Reclaimed Rubber Segment of the Rubber Processing Point Source Category," EPA 440/1-74/030a

- "Development Document and Effluent Limitations Guidelines and Standards for the Plastics Molding and Forming Point Source Category," EPA 440/1-84/069.

The types of activities at these facilities where exposure to storm water may occur consist primarily of loading/unloading activities, and the storage and handling of raw materials, by-products, final products or waste products. A wide variety of materials are used at the facilities including solvents, acids and caustic, carbon black, plasticizers, paint, processing oils, resins, rubber compounds and solutions, fuels such as

diesel or gasoline, adhesives, zinc and miscellaneous chemicals. Tanks, drums or bags of these materials may be exposed to storm water during loading/unloading operations, or through outdoor storage or handling at some facilities.

Other items which may be exposed to storm water include surplus processing machinery, scrap metal, scrap plastic and rubber, plastic pellets, PVC pipe and rags. Table Y-1 lists potential pollutant sources from activities that commonly take place at rubber, miscellaneous plastic products, and miscellaneous manufacturing industries.

TABLE Y-1.—COMMON POLLUTANT SOURCES

| Activity | Pollutant source | Pollutants |
|---|---|--|
| Outdoor material loading/unloading. | wooden pallets, spills/leaks from material handling equipment, solvents, resins. | TSS, oil and grease, organics. |
| Outdoor material and equipment storage. | solvents, acids and caustic, plasticizers, paint, lubricating oils, processing oils, resins, rubber compounds, mineral spirits, zinc, scrap metal, scrap plastic and rubber, plastic pellets, PVC pipe, and rags. | organics, zinc, hydrocarbons, oil and grease, acids, alkalinity. |

b. Storm water monitoring results. Tables Y-2 and Y-3 summarize the storm water monitoring results for the conventional parameters which were reported by facilities in this sector. Table Y-2 provides composite sample data and Table Y-3 provides the grab sample results.

TABLE Y-2.—COMPOSITE SAMPLE RESULTS

| Pollutant | Units | No. of samples | Mean | Min | Max | Median | 95th perc. | 99th perc. |
|--|-----------|----------------|--------|------|--------|--------|------------|------------|
| BOD ₅ | mg/L | 89 | 11.21 | 0.00 | 144.0 | 7.0 | 34.0 | 144.0 |
| COD | mg/L | 87 | 72.08 | 0.00 | 640.0 | 43.0 | 240.0 | 640.0 |
| NO ₃ + NO ₂ Nitrogen | mg/L | 86 | 1.26 | 0.00 | 32.0 | 0.67 | 3.56 | 32.0 |
| Total Kjeldahl Nitrogen | mg/L | 85 | 1.55 | 0.00 | 6.54 | 1.24 | 4.70 | 6.54 |
| Total Phosphorus | mg/L | 85 | 0.34 | 0.00 | 8.65 | 0.16 | 0.83 | 8.65 |
| TSS | mg/L | 87 | 119.32 | 0.00 | 2100.0 | 30.0 | 476.0 | 2100.0 |

TABLE Y-3.—GRAB SAMPLE RESULTS

| Pollutant | Unit | Number of samples | Mean | Min | Max | Median | 95th perc. | 99th perc. |
|--|-----------|-------------------|--------|-------|--------|--------|------------|------------|
| BOD ₅ | mg/L | 90 | 13.92 | 0.000 | 160.0 | 7.15 | 51.0 | 160.0 |
| COD | mg/L | 90 | 100.0 | 0.000 | 812.0 | 53.0 | 330.0 | 812.0 |
| NO ₃ + NO ₂ Nitrogen | mg/L | 89 | 0.86 | 0.000 | 5.23 | 0.58 | 2.93 | 5.23 |
| Total Kjeldahl Nitrogen | mg/L | 89 | 2.34 | 0.000 | 25.0 | 1.36 | 6.0 | 25.0 |
| Oil and grease | mg/L | 94 | 4.26 | 0.000 | 91.0 | 0.50 | 18.0 | 91.0 |
| pH | s.u | 86 | 7.17 | 2.56 | 10.1 | N/A | N/A | N/A |
| Total phosphorus | mg/L | 89 | 0.41 | 0.0 | 6.7 | 0.190 | 1.61 | 6.7 |
| TSS | mg/L | 90 | 188.55 | 0.000 | 2008.0 | 44.0 | 893.0 | 2008.0 |

For most pollutants, the grab samples are somewhat higher than the composite results indicating a moderate "first flush" effect. Overall, the monitoring results indicate wide variability in pollutant concentrations.

EPA also reviewed the monitoring results for nonconventional and priority toxic pollutants required by Parts B and C of Form 2F. Table Y-4 below summarizes the results for parameters where at least some of the reported

values exceeded NURP averages and may be a result of industrial activities at the facilities.

TABLE Y-4.—RESULTS FOR NONCONVENTIONAL AND PRIORITY TOXIC POLLUTANTS

| Pollutant | Unit | No. of obs./ detects grab samples | Range grab samples | No. of obs./ detects composite samples | Range com- posite sam- ples | Range NURP |
|------------------------------|-----------|---|-----------------------|---|-----------------------------------|---------------|
| 1,1,1 Tri-chloroethane | mg/L | 5/1 | 0.00–0.38 | 50/0 | 0 | .016–1.0 |
| Methylene Chloride | mg/L | 9/4 | 0.00–13.0 | 9/5 | 0.00–11.0 | .05–.145 |
| Toluene | mg/L | 11/1 | 0.00–0.70 | 12/1 | 00.0–3.8 | .03–.09 |
| Zinc | mg/L | 32/32 | 0.027–7.60 | 32/32 | 0.011–7.49 | .1–24 |

EPA contacted certain group members to try to determine more specifically the possible sources of the pollutants reported above. The elevated levels of zinc were detected primarily from storm water samples taken at rubber manufacturing facilities which use large amounts of zinc oxide in the production of rubber. Zinc oxide is used as a vulcanization accelerator and also retards the aging of rubber. Zinc stearate is also used at some facilities as a coating material to prevent sticking between rubber materials.

The elevated levels of methylene chloride were reported by certain manufacturers of polyurethane plastic foam products. Methylene chloride is widely used in this industry as a substitute blowing agent for freon. This material is handled and stored outside at some facilities, and the sampling results would appear to be related to these activities.

The elevated readings for 1,1,1 trichloroethane were also reported by a manufacturer of polyurethane plastic foam products. These results were obtained from storm water samples taken at an outfall downstream from off-loading areas for this material and from areas where tanks of the material are stored outdoors.

Elevated levels of toluene were reported by a manufacturer of the laminated film products. For this case, the results were thought to stem from leaks or drips from the carbon adsorption system which is used to remove toluene from solvent laden air. A rubber manufacturer also reported a detection of toluene in storm water runoff. For this case, the result was thought to be associated with the outdoor handling of containers of toluene which is used in the rubber manufacturing process.

Facilities in this sector utilize and conducted sampling for a wide variety of nonconventional and priority toxic pollutants in addition than those listed above. While the sampling results did not indicate any special concerns with regards to other pollutants, it should be noted that the above results are based on the limited sampling activity required by the group application regulations (40

CFR 122.26(c)(2)). Therefore, it would be premature to conclude that the above pollutants are the only pollutants which could ever be present at or above benchmark levels in the storm water discharges from facilities in this sector.

3. Options for Controlling Pollutants

In evaluating options for controlling pollutants in storm water discharges, EPA must achieve compliance with the technology-based standards of the Clean Water Act [Best Available Technology (BAT) and Best Conventional Technology]. The Agency does not believe that it is appropriate to establish specific numeric effluent limitations or a specific design or performance standard in this section for storm water discharges associated with industrial activity from rubber, miscellaneous plastic products and miscellaneous manufacturing industries to meet BAT/BCT standards of the Clean Water Act. Instead, this section establishes requirements for the development and implementation of site specific storm water pollution prevention plans consisting of a set of Best Management Practices (BMPs) that are sufficiently flexible to address different sources of pollutants at different sites.

Certain BMPs are implemented to prevent and/or minimize exposure of pollutants from industrial activities to storm water discharges. EPA believes the most effective BMPs for reducing pollutants in storm water discharges are exposure minimization practices. Exposure minimization practices lessen the potential for storm water to come into contact with pollutants. Good housekeeping practices ensure that facilities are sensitive to routine and nonroutine activities which may increase pollutants in storm water discharges. The BMPs which address good housekeeping and exposure minimization are easily implemented, inexpensive, and require little, if any, maintenance. BMP expenses may include construction of roofs for storage areas or other forms of permanent cover and the installation of berms/dikes. Other BMPs such as detention/retention ponds and filtering devices may be needed at these facilities because of the

contaminant level in the storm water discharges. The types of BMPs implemented will depend on the type of discharge, types and concentrations of contaminants, and the volume of the flow.

The selection of the most effective BMPs will be based on site-specific considerations such as: facility size, climate, geographic location, geology/hydrology and the environmental setting of each facility, and volume and type of discharge generated. Each facility will be unique in that the source, type, and volume of contaminated storm water discharges will differ. In addition, the fate and transport of pollutants in these discharges will vary. EPA believes that the management practices discussed herein are well suited mechanisms to prevent or control the contamination of storm water discharges associated with rubber, miscellaneous plastic products and miscellaneous manufacturing industries.

Part 1 group application data indicated that the most widely implemented BMP, used by approximately 36 percent of the sampling facilities, are dikes. Less than 10 percent of the sampling subgroup reported that they cover their storage or loading areas; approximately 12 percent have roofs over their raw materials; and less than 5 percent store raw materials indoors. Because BMPs described in part 1 data are limited, the Table Y-5 is provided to identify BMPs associated with activities that routinely occur at rubber, miscellaneous plastic products and miscellaneous manufacturing industries.

TABLE Y-5.—GENERAL STORM WATER BMPs FOR RUBBER, MISCELLANEOUS PLASTIC PRODUCTS, AND MISCELLANEOUS MANUFACTURING INDUSTRIES

| Activity | Best management practices (BMPs) |
|--|--|
| Outdoor unloading and loading. | <p>Confine loading/unloading activities to a designated area.</p> <p>Consider performing loading/unloading activities indoors or in a covered area.</p> <p>Consider covering loading/unloading area with permanent cover (e.g., roofs) or temporary cover (e.g., tarps).</p> <p>Close storm drains during loading/unloading activities in surrounding areas.</p> <p>Avoid loading/unloading materials in the rain.</p> <p>Inspect the unloading/loading areas to detect problems before they occur.</p> <p>Inspect all containers prior to loading/unloading of any raw or spent materials.</p> <p>Consider berming, curbing, or diking loading/unloading areas.</p> <p>Dead-end sump where spilled materials could be directed.</p> <p>Drip pans under hoses.</p> <p>Use dry clean-up methods instead of washing the areas down.</p> <p>Train employees on proper loading/unloading techniques and spill prevention and response.</p> |
| Outdoor Material Storage (including waste, and particulate emission management). | <p>Confine storage of materials, parts, and equipment to designated areas.</p> <p>Consider secondary containment using curbing, berming, or diking all liquid storage areas.</p> <p>Train employees on proper waste control and disposal.</p> <p>Train employees in spill prevention and response.</p> <p>Consider covering tanks.</p> <p>Ensure that all containers are closed (e.g., valves shut, lids sealed, caps closed).</p> <p>Wash and rinse containers indoors before storing them outdoors.</p> <p>If outside or in covered areas, minimize runoff of storm water by grading the land to divert flow away from containers.</p> <p>Leak detection and container integrity testing.</p> <p>Direct runoff to onsite retention pond.</p> |

| Activity | Best management practices (BMPs) |
|----------|---|
| | <p>Inventory all raw and spent materials.</p> <p>Clean around vents and stacks.</p> <p>Place tubs around vents and stacks to collect particulate.</p> <p>Inspect air emission control systems (e.g., baghouses) regularly, and repair or replace when necessary.</p> <p>Store wastes in covered, leak proof containers (e.g., dumpsters, drums).</p> <p>Consider shipping all wastes to offsite landfills or treatment facilities.</p> <p>Ensure hazardous waste disposal practices are performed in accordance Federal, State, and local requirements.</p> |

Sources: NPDES Storm Water Group Applications—Part 1. Received by EPA, March 18, 1991, through December 31, 1992.

EPA, Office of Water. September 1992. "Storm Water Management for Industrial Activities: Developing Pollution Prevention Plans and Best Management Practices." EPA 832-R-92-006.

There are three major types of facilities in this sector: (1) Rubber manufacturers, (2) manufacturers of miscellaneous plastic products, and (3) miscellaneous industries. In discussions with the rubber industry, the BMPs found in Table Y-6 were identified for rubber manufacturing to control discharges of zinc which was the most frequently reported toxic pollutant in the storm water sampling data:

TABLE Y-6.—BMPs FOR THE CONTROL OF ZINC AT RUBBER MANUFACTURERS

| Zinc source | BMPs |
|--|---|
| Poor housekeeping, bags of zinc stored outside, zinc spilled from trucks during unloading, spillage during emptying for plant use. | Employee training, spill cleanup, indoor storage, use of special large volume sacks with less potential for releases of zinc. |
| Zinc containers, rubber products, rags contaminated with zinc stearate discarded in outdoor dumpsters. | Cover the dumpsters, use linked dumpsters which do not leak or move dumpster inside. |

TABLE Y-6.—BMPs FOR THE CONTROL OF ZINC AT RUBBER MANUFACTURERS—Continued

| Zinc source | BMPs |
|---|--|
| Malfunctioning baghouses for dust collection. | Repair or replace the baghouse, regular maintenance. |
| Grinding operations from which zinc dust may be released. | Use dust collection system or reduce the amount of dust generated. |
| Drips of zinc stearate during coating operations. | Spill prevention/response, use of alternate compounds. |

4. Special Conditions

There are no additional requirements under this section other than those stated in the general fact sheet language.

5. Storm Water Pollution Prevention Plan Requirements

EPA believes that pollution prevention is the most effective approach for controlling contaminated storm water discharges from rubber, miscellaneous plastic products, and miscellaneous manufacturing industries. The requirements included in the pollution prevention plans provide a flexible framework for the development and implementation of site-specific controls to minimize the pollutants in storm water discharges. This flexibility is necessary because each facility is unique in that the source, type, and volume of contaminated storm water discharge will vary from site to site.

Under today's proposed permit, all facilities must prepare and implement a storm water pollution prevention plan. The pollution prevention plan requirement reflects EPA's decision to allow operators of rubber, miscellaneous plastic products, and miscellaneous manufacturing industries to utilize BMPs as the BAT/BCT level of control for the storm water discharges covered by this section. The pollution prevention plan requirements in this section are consistent with EPA's storm water general permits finalized on September 9, 1992 (57 FR 41236), and September 25, 1992 (57 FR 44438), for discharges in nonauthorized NPDES States.

There are two major objectives to a pollution prevention plan: (1) to identify sources of pollution potentially affecting the quality of storm water discharges associated with industrial activity from a facility; and (2) to describe and ensure implementation of practices to minimize and control pollutants in storm water discharges

associated with industrial activity from a facility.

Section 313 of EPCRA requires operators of manufacturing facilities that handle toxic chemicals in amounts exceeding threshold levels (listed at 40 CFR 372.25) to report to the Government on an annual basis. Because these types of facilities handle large amounts of toxic chemicals, EPA concluded that they have the increased potential to degrade the water quality of receiving streams. Consistent with Part VII.B. of this permit, Section 313 reporting facilities must fulfill specific requirements.

Except for the special controls discussed below for rubber manufacturers, there are no additional Pollution Prevention Plan requirements other than those stated in the multi-sector fact sheet language in Part VI.C.

a. Special measures and controls for rubber manufacturing facilities. For rubber manufacturers, this section also requires permittees to develop specific BMPs to control discharges of zinc in storm water runoff. The principal sources of zinc in storm water runoff at these facilities were identified above in Section 3. This section requires that rubber manufacturers review the possible sources of zinc listed below at their facilities and include as appropriate the accompanying BMPs in their storm water pollution prevention plans:

(1) *Inadequate housekeeping.* Permittees are required to review the handling and storage of zinc bags at their facilities. The following BMPs must be considered in developing the storm water pollution prevention plan: employee training regarding the handling and emptying of zinc bags, indoor storage of zinc bags, thorough cleanup of zinc spills without washing the zinc into a storm drain. Facilities must also consider the use of 2,500 pound sacks (from which spills are less likely) rather than 50 to 100 pound sacks.

(2) *Zinc in dumpsters.* The following BMPs must be considered to reduce this potential source of zinc: provide a cover for the dumpster or move the dumpster inside; provide a lining for the dumpster.

(3) *Malfunctioning dust collectors or baghouses.* Permittees must review dust collectors and baghouses as possible sources of zinc. Improperly operating dust collectors or baghouses must be replaced or repaired as appropriate; the plan must also provide for regular maintenance of these facilities.

(4) *Grinding operations.* Permittees must review dust generation from rubber grinding operations at their

facility and as appropriate, install a dust collection system.

(5) *Zinc stearate coating operations.* The plan must include measures to prevent and/or clean up drips or spills of zinc stearate slurry which may be released to a storm drain. Alternate compounds to zinc stearate must also be considered.

6. Numeric Effluent Limitations

There are no additional numeric effluent limitations beyond those described in Part VI.F.

7. Monitoring and Reporting Requirements

a. Monitoring requirements. The regulatory modifications at 40 CFR 122.44 (i)(2) established on April 2, 1992, grant permit writers the flexibility to reduce monitoring requirements in storm water discharge permits. EPA has determined that the potential for storm water discharges to contain pollutants above benchmark levels, because of the industrial activities and materials exposed to precipitation, does not support sampling at rubber, miscellaneous plastic products, and miscellaneous manufacturing industries. Based on a consideration of the BMPs typically used at these facilities, and generally low pollutant values from the application data, EPA believes that the pollution prevention plan with visual observations of storm water discharges will help to ensure storm water contamination is minimized. Because permittees are not required to conduct sampling, they will be able to focus their resources on developing and implementing the pollution prevention plan.

Quarterly visual inspections of a storm water discharge from each outfall are required. The inspection must be of a grab sample collected from each storm water outfall. The examination of storm water grab samples shall include any observations of color, odor, turbidity, floating solids, foam, oil sheen, or other obvious indicators of storm water pollution. The inspection must be conducted in a well lit area. No analytical tests are required to be performed on these samples.

The examination must be made at least once in each designated period during daylight hours unless there is insufficient rainfall or snow-melt to runoff. EPA expects that, whenever practicable, the same individual should carry out the collection and examination of discharges throughout the life of the permit to ensure the greatest degree of consistency possible. Examinations shall be conducted in each of the following periods for the purposes of

inspecting storm water quality associated with storm water runoff and snow melt: December to February; March to May; June to August; September to November. Grab samples shall be collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 60 minutes) of when the runoff begins discharging. Reports of the visual observation include: the examination date and time, examination personnel, visual quality of the storm water discharge, and probable sources of any observed storm water contamination. The visual observation reports must be maintained onsite with the pollution prevention plan.

EPA believes that this quick and simple assessment will help the permittee to determine the effectiveness of his/her plan on a regular basis at very little cost. Although the visual examination cannot assess the chemical properties of the storm water discharged from the site, the examination will provide meaningful results upon which the facility may act quickly. The frequency of this visual inspection will also allow for timely adjustments to be made to the plan. If BMPs are performing ineffectively, corrective action must be implemented. A set of tracking or follow-up procedures must be used to ensure that appropriate actions are taken in response to the inspections. The visual examination is intended to be performed by members of the pollution prevention team. This hands-on inspection will enhance the staff's understanding of the storm water problems on that site and the effects of the management practices that are included in the plan.

When a discharger is unable to collect samples over the course of the monitoring period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

As discussed above, EPA does not believe that chemical monitoring is necessary for rubber, miscellaneous plastic products, and miscellaneous manufacturing industries. EPA believes that between quarterly visual inspections and site compliance evaluations potential sources of contaminants can be recognized, addressed, and then controlled with BMPs. In determining the monitoring

requirements, EPA considered the nature of the industrial activities and significant materials exposed at these sites, and performed a review of data provided in Part 2 group applications.

b. Baseline general permit variance. On September 9, 1992, and September 25, 1992, EPA published the Final NPDES General Permits for Storm Water Discharges Associated With Industrial Activity. These notices set out requirements for semiannual monitoring for several parameters for discharges from rubber, miscellaneous plastic products, and miscellaneous manufacturing facilities. These notices specifically require that facilities with storm water discharges that are associated with rubber, miscellaneous plastic products, and miscellaneous manufacturing industries are required to monitor certain storm water discharges for oil and grease, COD, TSS, and pH. Today's proposed permit contains different monitoring requirements. EPA requests comment upon the difference between the monitoring requirements set out for rubber, miscellaneous plastic products, and miscellaneous manufacturing facilities in the September 1992 General Permits and those required in today's proposed permit.

8. Alternative Monitoring Requirements

EPA also requests comment upon the following monitoring and reporting requirements in lieu of those discussed above in Part VIII.Y.7.a. of today's proposed fact sheet.

a. Annual monitoring requirements. During the period beginning on the effective date and lasting through the expiration date of this permit and except as provided under Section VI.E.3., 6, or 7. (Sampling Waiver, Representative Discharge, and Alternative Certification) of the permit or Section VIII.Y.8.d. below, permittees with facilities covered under this section of the permit shall monitor storm water discharges associated with industrial activity once per year for the following pollutants:

- Zinc (for rubber manufacturers only)
 - Oil and grease, COD, TSS, pH; and
 - Any additional water priority chemical which the permittee, upon review of the Description of Potential Pollutant Sources (Section VI.C.2. above), may be present in storm water discharges in significant quantities.
- Permittees must retain monitoring results in accordance with Part VI.E. (Retention of Records). In addition to the parameters specified above, the permittee shall provide the date and duration (in hours) of the storm event(s)

sampled; rainfall measurements or estimates (in inches) of the storm event which generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

b. Sample type. All samples shall be collected as grab samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable.

c. Exemptions from storm water monitoring. Storm water monitoring may be discontinued on a pollutant-by-pollutant basis for the pollutants specified in Section VIII.Y.8.a. above if two successive samples indicate that a particular pollutant is not present in significant quantities. Monitoring may be discontinued entirely if two successive samples indicate that no pollutants are found in significant quantities.

d. Quarterly visual examination of storm water runoff. (1) On a quarterly basis, permittees shall conduct a visual examination of storm water discharges from each outfall which discharges storm water associated with industrial activity. If the facility has two or more outfalls with substantially identical effluents (based on a consideration of industrial activity, significant materials, and management practices and activities in the area drained by the outfall), the visual examination may be conducted on only one such outfall.

(2) The examination must be made at least once in each designated period during daylight hours unless there is insufficient rainfall or snow-melt to produce a runoff event. Examinations shall be conducted in each of the following periods for purposes of inspecting storm water quality associated with storm water runoff and snow-melt: December to February (storm water runoff or snow-melt); March to May (storm water runoff); June to August (storm runoff); and September to November (storm water runoff or snow-melt). February (storm water runoff or snow-melt; March to May

(storm water runoff); June to August (storm runoff); and September to November (storm water runoff or snow-melt).

(3) Examinations shall be conducted within the first 30 minutes (or as soon thereafter as practical, but not to exceed 60 minutes) of when the runoff begins discharging. The examinations shall include any observations of color, odor, turbidity, floating solids, foam, oil sheen or other obvious indications of storm water pollution. No analytical tests are required to be performed. Examinations shall be conducted so as to provide a reasonable representation of the nature of a typical storm water discharge at that site during that time of year.

(4) Information must be maintained on site and include: the examination date and time, examination personnel, visual quality of the storm water discharge, and probable sources of any observed storm water contamination.

Z. Storm Water Discharges Associated With Industrial Activity From Leather Tanning and Finishing Facilities

1. Discharges Covered Under This Section

Storm water discharges covered by this section include all discharges from leather tanning facilities, commonly identified by Standard Industrial Classification (SIC) code 3111 and facilities which make fertilizer solely from leather scraps and leather dust where precipitation and storm water runoff come into contact with significant materials including, but not limited to, raw materials, waste products, by-products, stored materials, and fuels. This includes storm water discharges from access roads, and rail lines used or traveled by carriers of raw materials, manufactured products, waste materials, or by-products created by the facility. This section does not cover any discharge subject to process wastewater effluent limitation guidelines, including storm water that combines with process wastewater. Storm water that does not come into contact with any overburden, raw material, intermediate product, finished product, by-product or waste product located on the site of the operation are not subject to permitting under this section according to 402(1)(2) of the Clean Water Act (CWA).

When an industrial facility, described by the above eligibility provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the

other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

If monitoring and pollution prevention plan requirements of another industrial activity section of this permit apply to co-located industrial activities at an industrial facility, the eligibility provisions of that industrial activity section shall not preclude the operator of the industrial facility from complying with the applicable monitoring and pollution prevention plan requirements of that section.

a. Industry profile. The storm water permit application regulations define storm water discharge associated with industrial activity at 40 Code of Federal Regulations (CFR) 122.26(b)(14). Category (ii) of this definition includes facilities identified by SIC code 3111, establishments primarily engaged in tanning, currying, and finishing hides and skins into leather. Most tanneries are small family operations, although several are divisions of larger corporations. The leather tanning and finishing industry currently includes approximately one hundred fifty facilities. There are effluent limitations guidelines for the leather tanning industry based on 9 subcategories, as described in the "Development Document for Effluent Limitations Guidelines and Standards for Leather Tanning and Finishing Point Source Category." (The subcategories were based on distinct combinations of raw materials and leather processing operations.)

Leather tanning or finishing is the conversion of animal hides or skins into leather. Leather is made from the inner layer of the animal skin, which consists primarily of the protein collagen. Tanning is the reaction of the collagen fibers with tannins, chromium, alum or other tanning agents. Tanning processes use sodium dichromate, sulfuric acid

and detergents and a variety of raw and intermediate materials.

There are three major processes required to make finished leather. These are beamhouse operations, tanyard processes and retanning and finishing processes. In general, most tanneries perform the entire tanning process, from beamhouse to wet finishing operations. A smaller number perform only beamhouse and tanyard operations and sell their unfinished product (wet "blue" stock) to other tanneries. These processes are described below:

- *Beamhouse Operations*—These consist of four activities: side and trim; soak and wash; fleshing and unhairing. Side and trim is the cutting of the hide into two sides and trimming of areas which do not produce good leather. In soak and wash processes, the hides are soaked in water to restore moisture lost during curing. Washing removes dirt, salt, blood, manure, and nonfibrous proteins. Fleshing is a mechanical operation which removes excess flesh. The removed matter is normally recovered and sold for conversion to glue. Unhairing involves using calcium hydroxide, sodium sulfhydrylate, and sodium sulfide to destroy the hair (hair pulp process) or remove hair roots. A mechanical unhairing machine can also be used to remove hair loosened by chemicals (hair save process). Beamhouse processes can account for approximately 60 percent of the pollutant load (except chromium) from a complete tannery. Pollutants that may be produced are proteinaceous organic and inorganic pollutants characterized by a high pH (10–12) and substantial amounts of Biochemical Oxygen Demand (BOD), Chemical Oxygen Demand (COD), Total Suspended Solids (TSS), Total Kjeldahl Nitrogen (TKN), and sulfides.

- *Tanyard Processes*—These consist of bating, pickling, tanning, wringing, splitting, and shaving. Bating involves the addition of salts of ammonium sulfate or ammonium chloride used to convert the residual alkaline chemicals present from the unhairing process into soluble compounds which can be washed from the hides or skins. "Pickling" the hide with sulfuric acid provides the acid environment

necessary for chromium tanning. In the tanning process, tanning agents such as trivalent chromium and vegetable tannins convert the hide into a stable product which resists decomposition. Wringing of the "blue hides" (hides tanned with chromium) removes excess moisture with a machine similar to a clothes wringer. Splitting adjusts the thickness of the tanned hide to the requirements of the finished product and produces a "split" from the flesh side of the hide. The hide is then shaved to remove any remaining fleshy matter. Wastewater from tanyard operations contain inorganic chemical salts, small amounts of proteinaceous hair and waste, and large amounts of ammonia from the bating process. Pickling generates a highly acidic waste (pH of 2.5–3.5) which contains salt. Spent chromium liquors contain high concentrations of trivalent chromium in acid solution with low concentrations of BOD and TSS. Vegetable tanning vat discharges are highly colored, and contain significant amounts of BOD, COD, and dissolved solids.

- *Retanning and Wet Finishing Processes*—These include retanning, bleaching, coloring, fatliquoring, and finishing. The most common retanning agents are chromium, vegetable extracts and syntans (based upon naphthalene and phenol). Sodium bicarbonate and sulfuric acid are sometimes used to bleach leather. Coloring involves the use of dyes (usually aniline based) on the tanned skin. Animal or vegetable fatliquors are added to replace the natural oils lost in the beamhouse and tanyard processes. Finishing includes all operations performed on the hide after fatliquoring, and includes finishing to enhance color and resistance to stains and abrasions, smoothing and stretching of the skin, drying, conditioning, staking, dry milling, buffing and plating. These processes generate wastes with additional quantities of trivalent chromium, tannins, sulfonated oils, and spent dyes, which are low in BOD and TSS, and high in COD.

Table Z-1 lists potential storm water pollutant source activities that may take place at leather tanning facilities.

TABLE Z-1.—POLLUTANTS POTENTIALLY FOUND IN STORM WATER DISCHARGES AT LEATHER TANNING FACILITIES

| Activity | Pollutant source | Pollutant |
|---|--|---|
| Outdoor storage of fresh and brine cured hides | fresh and brine cured hides | salt, organic materials (manure), biochemical oxygen demand, deplatory chemicals. |
| Beamhouse processes (trimming, soak and wash, fleshing, unhairing). | chemical storage (drums or bags). empty containers of lime, deplatory chemicals. trim scraps, hair | calcium hydroxide, sodium sulfhydrylate, or sodium sulfide. BOD, COD, TSS. |

TABLE Z-1.—POLLUTANTS POTENTIALLY FOUND IN STORM WATER DISCHARGES AT LEATHER TANNING FACILITIES—Continued

| Activity | Pollutant source | Pollutant |
|---|---|---|
| Tanyards (bating, pickling, tanning, wringing, splitting, shaving). | empty chemical containers | trivalent chromium, vegetable tannins, enzymes, pickling acids (sulfuric acid), alum, syntans, chemical deliming agents, formaldehyde, gluteraldehyde, heavy oils. |
| | "blue" hides, splits, trimmings, shavings. | trivalent chromium, leather fiber and dust, suspended solids. |
| Retan and wet finishing (retanning, bleaching and coloring, fatliquoring, buffing). | empty chemical containers | chromium tanning agents, vegetable extract, dyes, pigments, animal or vegetable based oils, synthetic oils made from modified mineral based oils. |
| | leather dust containing chromium. | leather fiber, chromium, suspended solids. |
| Dry finishing (Application of pigment to leather surface with water-based or solvent based finishes). | emissions from spray booths and spent solvents. | pigments, solvents-acetone, pyrene, glycol ether. |
| Receiving and unloading areas | hides | chromium, salt. |
| | chemical supplies | depilatory chemicals, trivalent chromium, vegetable tannins, enzymes, pickling acids (sulfuric acid), alum, syntans, chemical deliming agents, formaldehyde, gluteraldehyde, heavy oils, dyes, pigments, animal or vegetable based oils, synthetic oils, solvents and biocides. |
| | leaking truck | Soil and grease and waste materials. |
| | accidental spills | chemicals listed for supplies above. |
| Improper connections to storm sewer | floor drains-process wastewater, cleaning and washdown of process equipment and process areas. | dependent on operations. |
| Outdoor bulk chemical storage | above ground tanks | sulfuric acid, ferric chloride, finishing solvents (mineral spirits), hydrated lime, surfactant. |
| Outdoor storage of coal | coal piles | oil and grease, TSS, copper, nickel, zinc. |
| Waste management | hoppers | leather dust, scraps. |
| | dumpsters | empty bags and chemical containers. |
| | sludge (wastewater treatment sludge stored in containers to diminish storm water contact, awaiting offsite disposal). | lime, pieces of leather, hair, protein-like substances, floor sweepings, trivalent chromium, biochemical oxygen demand. |

2. Special Conditions

There are no additional requirements beyond those described in Part VI.B. of this fact sheet.

3. Pollutants Found in Storm Water Discharges From Leather Tanning Operations

The impacts caused by storm water discharges from leather tanning facilities will depend on the geographic location of the facility, the types of industrial activities occurring onsite (e.g., beamhouse, tanyard, retan and wet finishing, dry finishing); the types of significant materials exposed to storm water (e.g., chromium tanned leather shavings, chemical containers etc.), the size of the operation; and the type, duration, and intensity of precipitation events. Other factors such as air emissions (i.e., settled dust), materials storage, spills, improperly dumped

materials, and illicit conditions may also impact receiving waters. (Illicit connections are contributions of unpermitted non-storm water discharges to storm sewers.)

Part 1 group application information indicates that the industrial activities occurring at leather tanning facilities include leather tanning plant yards; unhairing (76.9 percent of samplers); chromium tanning (69.2 percent of samplers); splitting and shaving (76.9 percent) retanning (69.2 percent); wet hide finishing-buffing (76.9 percent); dry finishing; vegetable tanning (30.8 percent); immediate access roads and rail lines used or traveled by carriers of raw materials (38.5 percent of samplers), manufactured products, waste management (36.8 percent); material handling sites (23.1 percent); refuse sites; sites used for the application or disposal of process wastewaters (as defined at 40 CFR part 401) sites used

for residual treatment, storage or disposal (waste water treatment (30.8 percent); shipping and receiving areas (69.2 percent of samplers); finished materials; and areas where industrial activity has taken place in the past and significant materials remain and are exposed to storm water. (40 CFR 122.26(b)(14).

Significant materials include raw materials, brine or salt cured hides and skins (7.7 percent), fuels (15.4 percent), materials such as solvents, detergents, finished materials; hazardous substances designated under Section 101(14) of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), any chemical required to be reported pursuant to Section 313 of Title III of the Superfund Amendments and Reauthorization Act; fertilizers; pesticides; and waste products such as sludge (7.7 percent) that have the

potential to be released with storm water discharge. (40 CFR 122.26(b)(12)). Other significant materials found at leather tanning facilities include leather shavings and dust (46.2 percent), leather scrap (30.8 percent), blue hides and splits (46.2 percent), empty chemical containers, spent solvents, emissions from spray booths, and wastes in dumpsters. Significant materials produced from various industrial activities occurring at leather tanning facilities are summarized in Table Z-1.

EPA has received part 2 storm water discharge data from all of the 12 designated samplers under part 2 of the group application process. All part 2

data submittals list roof/pavement runoff as the pollutant source. After review of part 1 information and the Development Document for Effluent Limitation Guidelines, EPA has identified potential storm water pollutants and sources resulting from various leather tanning activities. BOD, COD, TSS, and chromium are pollutants of concern.

When all the part 2 data was compiled, large variations in the minimum and maximum values were found for each of the conventional pollutants.

- Grab sample values for total suspended solids ranged from 0

milligrams per liter (mg/L) to 4,000 mg/L and flow weighted composite samples ranged from 0 mg/L to 670 mg/L.

- Grab sample values for COD ranged from 0 mg/L to 2,100 mg/L and flow weighted composite samples ranged from 0 mg/L to 460 mg/L.

- Grab samples for oil and grease ranged from 0 mg/L to 130 mg/L.

Table Z-2 indicates the minimum and maximum values, means, medians, 95th percentiles, 99th percentiles and the total number of data submittals for each of the conventional pollutants. In most cases the mean values for the grab samples were higher than the mean values for composite samples.

TABLE Z-2.—STATISTICS FOR CONVENTIONAL AND NONCONVENTIONAL POLLUTANTS FOR LEATHER TANNING FACILITIES¹ (MG/L EXCEPT AS NOTED)

| Pollutant | Number of samples | | Mean | | Minimum | | Maximum | | Median | | 95th percentile | | 99th percentile | |

¹ Applicants that did not report the units of measurement for the reported values of pollutants were not included in these statistics.^u Composite samples.

All facilities submitted data for chromium, indicating that facilities expect chromium to be present. Concentrations of chromium ranged from .0100 mg/L to 5.7 mg/L.

Materials management practices are used to reduce the contact of precipitation and storm water runoff with significant materials, or to reduce the offsite discharge of contaminants. Part 1 group application data indicate that storm water management practices currently used at leather tanning facilities include berms/dikes (23.1 percent of samplers), drums, containers, roofing/covers, indoor storage of equipment and treatment (detention ponds (15.4 percent)).

Sources of pollutants of concern and effects on water bodies from these pollutants are summarized as follows:

- **Total Chromium**—Chromium compounds are used extensively throughout the leather tanning industry and is the most prevalent toxic pollutant found in wastewaters in this industry. At least 80 percent of all leather is chromium tanned. The chemistry of chromium is very complex, with interferences from complexing mechanisms, such as chelation by organic matter and dissolution due to presence of carbonates. The limited data submitted with part 2 of the application process indicate a range of 0.011 mg/L to 0.9600 mg/L for the composite samples and a wider range of 0.0100 mg/L to 5.7 mg/L for grab samples. As a comparison, values for chromium from National Urban Runoff Program (NURP) data ranged from 1–190 micrograms per liter ($\mu\text{g/L}$). EPA Water Quality Criteria for trivalent chromium are 1700 $\mu\text{g/L}$ for fresh water aquatic life and 170,000 $\mu\text{g/L}$ for human health. When the human health water quality criteria were recalculated using Integrated Risk Information System data, this value became 33,000 $\mu\text{g/L}$.

- **Biochemical Oxygen Demand**—BOD is the quantity of oxygen required for the biological and chemical oxidation of waterborne substances under ambient conditions. The BOD test is used widely to estimate the oxygen requirements of discharged domestic and industrial wastes. Specific chemical test methods are not readily available for measuring the quantity of many degradable substances and their reaction products. In such cases, testing relies on the collective parameter, Five-day BOD (BOD_5). The BOD_5 of a waste adversely affects the dissolved oxygen resources of a body of water by reducing the oxygen available to fish, plant life, and other aquatic species. Water with a high BOD indicates the presence of decomposing organic matter and associated increased

bacterial concentrations that degrade its quality and potential uses. In most leather tanning facilities, the storm water runoff BOD_5 will result from organic materials, such as dissolved or pulped hair and other extraneous hide substances, and from ammonia which is derived from residual bating chemicals and from hydrolytic deamination of proteinaceous hair and hide substance. Part 2 data for BOD showed ranges of 0 to 92.0 mg/L for composite samples and 0.0 to 320 mg/L for grab samples. As a comparison NURP BOD values, for average residential or commercial site concentrations were 12 mg/L.

- **Total Suspended Solids**—Suspended solids include both organic and inorganic materials. The inorganic compounds include sand, silt, clay, and toxic metals. The organic fraction includes such materials as grease, oil, animal and vegetable waste products, and adsorbed toxic organic pollutants. Solids may be inert, slowly biodegradable materials, or rapidly decomposable substances. While in suspension they increase the turbidity of the water, reduce light penetration, and impair the photosynthetic activity of aquatic plants. Aside from any toxic effect attributable to substances leached out by water, suspended solids may kill fish and shellfish by causing abrasive injuries, clogging gills and respiratory passages, screening out light, and by promoting and maintaining the development of noxious conditions through oxygen depletion. Suspended solids also reduce the recreational value of the water. Materials which may contribute to TSS are leather scraps and dust, and hair. Part 2 data for TSS show a wide range of 0–670 mg/L for the composite samples and 0–4000 mg/L for grab samples. As a comparison NURP TSS values, for average residential or commercial site concentrations were 239 mg/L.

- **Chemical Oxygen Demand**—The COD test measures those pollutants resistant to biological oxidation in addition to the ones measured by the BOD_5 test. COD is therefore a more inclusive measure of oxygen demand than is BOD_5 and results in higher oxygen demand values than the BOD_5 test. The compounds which are more resistant to biological oxidation are becoming of greater concern, not only because of their slow but continuing oxygen demand on the resources of the receiving water, but also because of their potential health effects on aquatic and human life. Concern about these compounds has increased as a result of demonstrations that their long life in receiving waters allows them to contaminate downstream water intakes.

Substances which could contribute to high COD concentrations in storm water discharges are extraneous hide substances, complex organic and inorganic process chemicals, dyes, and vegetable tannins. Part 2 COD data shows wide ranges of 0 to 460 mg/L for the composite sample and 0 to 2100 mg/L for the grab samples. As a comparison NURP COD values, for average residential or commercial site concentrations were 94 mg/L.

- **Nitrate Plus Nitrite Nitrogen**—Ammonia in the presence of dissolved oxygen, is converted to nitrate (NO_3) by nitrifying bacteria. EPA considers nitrates to be among the objectionable components of mineralized waters. Excess nitrates irritate the gastrointestinal tract, causing diarrhea and diuresis. Methemoglobinemia, a condition characterized by cyanosis and resulting in infant and animal deaths, can be caused by high nitrate concentrations in drinking waters. Nitrite (NO_2) which is an intermediate product between ammonia and nitrate, sometimes occurs in quantity when depressed oxygen conditions permit. Part 2 data showed values for nitrate plus nitrite nitrogen which ranged from 0.3 to 9.60 mg/L for composite samples and .06 to 11 mg/L for the grab samples. As a comparison NURP values, for average residential or commercial site concentrations were 1.37 mg/L.

- **Total Kjeldahl Nitrogen**—TKN is a measure of the ammonia nitrogen plus organic nitrogen in wastewater. Organic nitrogen (as measured approximately by TKN minus ammonia) is derived primarily from dissolved or pulped proteinaceous hair removed from hides. Biological deamination and hydrolysis of this organic nitrogen during biological treatment yields another significant source of ammonia. Hence, TKN measures the major nitrogen impact upon a receiving water and is an important measure, in addition to ammonia of the potential environmental impact of nitrogen contained in tannery storm water. Part 2 TKN data showed a range of 0.9 to 38.0 mg/L for composite samples and 0.7 to 46.0 mg/L for grab samples. As a comparison NURP TKN values, for average residential or commercial site concentrations were 2.3 mg/L.

- **pH**—The hydrogen ion concentration in an aqueous solution is represented by pH. The pH scale ranges from zero to fourteen. Values of pH less than seven represent acidic conditions; values greater than seven represent basic conditions. The pH level is easily measured and is an indication of potential environmental impacts. Storm water discharges with pH values

markedly different from the pH values of the receiving stream are potentially detrimental to the environment. At outfalls and prior to complete mixing of storm water discharges with receiving waters, a zone of sudden pH change can damage or kill biota engulfed in the zone of change. Data submitted for part 2 of the application indicate that pH varies from 4.8 to 9.1 standard units. Some of the samples were outside the permitted range for wastewater discharges under the effluent limitation guidelines (pH 6–9), however, most samples submitted to EPA were within the 6.0 to 9.0 range.

- **Oil and Grease**—Sources of oil and grease from leather tanning facilities include degreasing processes, vehicle maintenance and oils used in leather processing (fatliquoring). Oil and grease emulsions are detrimental to aquatic organisms and inhabitants because depositions of oil and grease can impact the aquatic food chain by inhibiting normal benthic growths; destroy algae or other plankton; adhere to the gills of fish; and damage the plumage and coats of aquatic animals and fowls. Floating oil may reduce the re-aeration of the water surface, and in conjunction with emulsified oil, may interfere with photosynthesis. Part 2 data indicate that oil and grease varies in grab samples from 0.0 to 130.0 mg/L.

- **Total Phosphorus**—Total phosphorus is comprised of dissolved and suspended phosphorus. Phosphorus occurs in natural waters and wastewaters almost exclusively as phosphates. Phosphates are found in bottom sediments and in biological sludge. Phosphorus is essential to the growth of organisms and can be the nutrient that limits the primary productivity of a body of water. In instances where phosphate is a growth limiting nutrient, the discharge of raw or untreated wastewater, agricultural drainage, or certain industrial wastes to that water may stimulate the growth of photosynthetic aquatic organisms in nuisance quantities. Values for phosphorus ranged from a minimum of 0 mg/L to 3.0 mg/L for grab samples and 0.030 mg/L to 18.0 mg/L for composite samples. As a comparison NURP phosphorus values, for average residential or commercial site concentrations were 0.5 mg/L.

Table Z–3 lists the potential pollutant sources for each of the parameters discussed.

TABLE Z–3—LIST OF POTENTIAL POLLUTANT SOURCES

| Parameter | Pollutant sources |
|---------------------------|---|
| Oil and Grease. | Degreasing processes, oils used in leather processing (fatliquoring). |
| COD | Complex organic and inorganic process chemicals, dyes, vegetable tanning, extraneous hide substances. |
| BOD ₅ | Carbonaceous organic materials such as dissolved or pulped hair and other extraneous hide substances, nitriles, ammonia from residual bating chemicals and from hydrolytic deamination of proteinaceous hair and hide substances. |
| pH | Acidic or alkaline materials. |
| TSS | Leather dust, scraps, hair. |
| Total phosphorus. | Detergents. |
| Nitrate nitrite nitrogen. | Spent bating liquors and breakdown of organic proteins (dissolved hair and dermal matter). |
| Total Kjeldahl nitrogen. | Dissolved or pulped proteinaceous hair. |
| Chromium | Blue hides, leather scraps and dust, waste materials such as empty containers, sludge. |

4. Options for Controlling Pollutants

The measures implemented to reduce pollutants in storm water associated with leather tanning operations are generally uncomplicated practices. The following table identifies Best Management Practices (BMPs) associated with different activities that take place at leather tanning facilities. The most effective BMPs will be selected on the basis of site-specific considerations (e.g., facility size, industrial processes performed geographic location, significant materials, volume and type of discharge generated). Because of the industrial processes involved in leather tanning, BMPs that concentrate on source reduction, recycling and containment/diversion will be the most helpful for reducing pollution in storm water runoff.

Source reduction BMPs include good housekeeping, materials management practices, preventive maintenance, spill prevention and response activities and employee training. Activities associated with good housekeeping include:

- **Operation and Maintenance**—Keep floors clean and dry, regularly pick up

garbage and waste materials, make sure equipment is working properly, routinely inspect for leaks or conditions that could lead to discharges of chemicals or contact of storm water with raw materials, intermediate materials, waste materials etc., reduce chemical spills resulting from carelessness and prepare program to control spills and carry out cleanups. Ensure that spill cleanup procedures are understood by employees. Eliminate unnecessary uses of water such as leaving hoses running.

- **Materials Storage and Maintenance**—Store containers away from direct traffic routes to prevent accidental spills, stack containers according to manufacturers instructions to avoid damaging containers, store containers on pallets to prevent corrosion of containers, assign responsibility of hazardous material inventories to a limited number of people who are trained to handle hazardous materials.

- **Material Inventory Procedures**—Identify all chemical substances present in the work place, label all containers, clearly mark on the inventory hazardous materials that require special handling, storage or use.

- **Preventive Maintenance**—Identify equipment, systems and facility areas that should be inspected, schedule periodic inspections of the equipment and systems, timely adjustments, repair, or replacement of equipment and systems. Maintain complete records on inspections, equipment, and systems. Install automatic monitoring devices to detect abnormal discharge of gases and hazardous substances.

Containment/diversion BMPs involve segregating areas of concern by covering or berming the activity and controlling dust. Diversion dikes, curbs and berms are temporary or permanent diversion structures that prevent runoff from passing beyond a certain point, and divert runoff away from its intended path. Dikes, curbs and berms are already in use at some leather tanning facilities.

Part 1 group application data indicate that BMPs have not been widely implemented at the representative sampling facilities. The most commonly listed material management practice is roofing and covers. Table Z–4 lists BMPs associated with different activities that take place at leather tanning facilities.

TABLE Z-4.—LIST OF BEST MANAGEMENT PRACTICES

| Activity | Best management practices |
|--|--|
| Temporary outdoor storage of fresh or brine cured hides. | Store hides indoors if possible. |
| Beamhouse operations | <p>Cover the hides with a roof or temporary covering (e.g., polyethylene, tarpaulin etc.).</p> <p>Minimize storm water runoff by enclosing the area or building a berm around the area.</p> <p>Inspect area regularly for proper implementation of good housekeeping and control measures.</p> <p>Store chemical drums and bags and empty lime and depilatory chemical containers indoors if possible, preventive maintenance.</p> <p>Cover chemical drums and bags, empty lime and depilatory chemical containers and leather scraps with roof or temporary covering (e.g., tarpaulins, polyethylene) and store on elevated impermeable surface.</p> <p>Curbing, containment dikes around chemical storage, empty lime and depilatory chemical containers and leather scrap storage area.</p> <p>Inspect area regularly for leaking drums, broken bags, proper implementation of good housekeeping and control measures (broken cracked dikes), material inventory, material storage and operation and maintenance.</p> <p>Clean up leaks and spills quickly and completely, use drip pans for leaking equipment.</p> <p>Good Housekeeping—all paved areas should be swept regularly, eliminate unnecessary flushing with water and label chemical drums and containers.</p> <p>Employee training on good housekeeping, proper handling of chemicals.</p> |
| Tanyards | BMPs for Tanyards (empty chemical containers and hides, leather dust, shavings) are the same as those listed above for Beamhouse Activities. |
| Retan and wet finish | <p>Dust reduction through frequent inspection of vacuum, collector (bag & cyclone), and filter systems.</p> <p>Dust reduction through enclosure and covering.</p> <p>Preventive maintenance/inspection of dust collection systems.</p> <p>Good Housekeeping—regular sweeping of paved areas, eliminate unnecessary flushing with water and label chemical drums and containers.</p> <p>Employee training on good housekeeping, proper handling of chemicals.</p> |
| Dry Finish | Preventive maintenance, inspection of spray booths. |
| Receiving and shipping | <p>Employee training on proper disposal of spent solvents.</p> <p>Cover shipping and receiving area.</p> <p>Cover trucks.</p> <p>Vehicle positioning—locating trucks while transferring materials to prevent spills onto the ground surface.</p> <p>Grade berm or curb area to prevent storm water runoff contamination, divert rain gutters away from loading area.</p> <p>Clean spills immediately.</p> <p>Inspect trucks for leaks.</p> <p>Employee training in spill prevention.</p> |
| Liquid storage in above ground tanks | <p>Clearly tag valves to avoid human error.</p> <p>Install overflow protection devices on tank systems to warn operator or to automatically shut down transfer pumps when tanks reach full capacity.</p> <p>Secondary containment around tanks.</p> <p>Employee training.</p> <p>Inspection of tank foundations, connections, coatings, valves and piping systems.</p> <p>Comply with existing spill prevention, cleanup and countermeasure plans (SPCC plan) and State and Federal laws.</p> |
| Improper connections to storm sewers | <p>Integrity testing by qualified professional.</p> <p>Plug all floor drains connected to sanitary or storm sewer.</p> <p>Perform smoke or dye testing to determine if interconnections exist between sanitary water system and storm sewer system.</p> <p>Update facility schematics to accurately reflect all plumbing connections.</p> <p>Install a safeguard against washwaters from processing areas entering the storm sewer unless permitted.</p> |
| Waste management | <p>Train employees on proper disposal practices for all materials.</p> <p>Conduct waste reduction assessment—develop guidelines for the elimination of waste generation emissions.</p> <p>Institute industrial waste source reduction and recycling BMPs.</p> <p>Move waste management activities indoors (after safety concerns are addressed) and cover waste piles, dumpsters, hoppers, place on impermeable elevated surfaces.</p> <p>Prevent storm water runoff by curbing, building berms.</p> <p>Cover trucks and inspect for leaking wastes.</p> <p>Inspection of waste management areas for leaking containers, spills, damaged containers, uncovered waste piles, dumpsters, hoppers.</p> <p>Inspection of roof areas and outside equipment.</p> <p>Develop and maintain proper erosion control or site stabilization measures.</p> <p>Train employees on proper disposal practices for all materials.</p> |

5. Storm Water Pollution Prevention Plan Requirements

All facilities covered by this section must prepare and implement a storm water pollution prevention plan. The establishment of a pollution prevention plan requirement reflects EPA's decision to allow operators of leather tanning facilities to select BMPs as the Best Available Technology/Best Control Technology (BAT/BCT) level of control for the storm water discharges covered by this section. The requirements included in pollution prevention plans provide a flexible framework for the development and implementation of site specific controls to minimize pollutants in storm water discharges. This approach is consistent with the approach used in the baseline general permits finalized on September 9, 1992 (57 FR 41236).

EPA believes that pollution prevention is the most effective approach for controlling contaminated storm water discharges from leather tanning facilities. Pollution prevention plans allow the operator of a facility to select BMPs based on site-specific considerations such as facility size, climate, geographic location, the environmental setting of the facility, and volume and type of discharge generated. This flexibility is necessary because each facility will be unique in that the source, type, and volume of contaminated surface water discharges will differ from site to site.

There are two major objectives to a pollution prevention plan (1) to identify sources of pollution potentially affecting the quality of storm water discharges associated with industrial activity from a facility; and (2) to describe and ensure implementation of practices to minimize and control pollutants in storm water discharges associated with industrial activity from a facility. Specific requirements for a pollution prevention plan for leather tanning facilities and facilities which make fertilizer solely from leather scraps and dust are described below.

a. Contents of the plan. Storm water pollution prevention plans are intended to help leather tanners evaluate all potential pollution sources at a site, and assist in the selection and implementation of appropriate measures designed to prevent, or control the discharge of pollutants in storm water runoff. EPA has developed guidance entitled "Storm Water Management for Industrial Activities: Developing Pollution Prevention Plans and Best

Management Practices," EPA, 1992 (EPA 832-R-92-006), to assist permittees in developing and implementing pollution prevention measures.

(1) *Description of potential pollutant sources.* Each storm water pollution prevention plan must describe activities, materials, and physical features of the facility that may contribute to storm water runoff or, during periods of dry weather result in dry weather flows. This assessment of storm water pollution will support subsequent efforts to identify and set priorities for necessary changes in materials, materials management practices, or site features, as well as aid in the selection of appropriate structural and nonstructural control techniques. Plans must describe the following elements:

(a) *Drainage.*—The plan must contain a map of the site that shows the pattern of storm water drainage, structural features that control pollutants in storm water runoff and process wastewater discharges, surface water bodies (including wetlands), places where significant materials are exposed to rainfall and runoff, and locations of major spills and leaks that occurred in the 3 years prior to the effective date of this permit. The map also must show areas where the following activities take place: Fueling, vehicle and equipment maintenance and/or cleaning, loading and unloading, material storage (including tanks or other vessels used for liquid or waste storage), material processing, and waste disposal, haul roads, access roads, and rail spurs. In addition the site map must also identify monitoring locations.

(b) *Inventory of exposed materials.*—Facility operators are required to carefully conduct an inspection of the site and related records to identify significant materials that are or may be exposed to storm water. The inventory must address materials that within 3 years prior to the effective date of the permit have been handled, stored, processed, treated, or disposed of in a manner to allow exposure to storm water. Findings of the inventory must be documented in detail in the pollution prevention plan. At a minimum, the plan must describe the method and location of onsite storage or disposal; practices used to minimize contact of materials with rainfall and runoff; existing structural and nonstructural controls that reduce pollutants in storm water runoff; existing structural controls

that limit process wastewater discharges; and any treatment the runoff receives before it is discharged to surface waters or a separate storm sewer system. The description must be updated whenever there is a significant change in the types or amounts of materials, or material management practices, that may effect the exposure of materials to storm water.

(c) *Significant spills and leaks.*—The plan must include a list of any significant spills and leaks of toxic or hazardous pollutants that occurred in the 3 years prior to the effective date of the permit. Significant spills include, but are not limited to, releases of oil or hazardous substances in excess of quantities that are reportable under Section 311 of CWA (see 40 CFR 110.0 and 40 CFR 117.21) or Section 102 of CERCLA (see 40 CFR 302.4). Significant spill may also include releases of oil or hazardous substances that are not in excess of reporting requirements and release of materials that are not classified as oil or a hazardous substance. The list shall be updated as appropriate during the term of the permit.

(d) *Sampling data.*—Any existing data on the quality or quantity of storm water discharges from the facility must described in the plan. The description should include a discussion of the methods used to collect and analyze the data. Sample collection points should be identified in the plan and shown on the site map.

(e) *Risk identification and summary of potential pollutant sources.*—The description of potential pollution sources culminates in a narrative assessment of the risk potential that sources of pollution pose to storm water quality. This assessment should clearly point to activities, materials, and physical features of the facility that have a reasonable potential to contribute significant amounts of pollutants to storm water. Any such activities, materials, or features must be addressed by the measures and controls subsequently described in the plan. In conducting the assessment, the operator of the facility must consider the following activities: loading and unloading operations; outdoor storage activities; outdoor processing activities; significant dust or particulate generating processes; and onsite waste disposal practices. The assessment must list any significant pollution sources at the site and identify the pollutant parameter or parameters (i.e., total suspended solids,

biochemical oxygen demand, etc.) associated with each source.

(2) *Measures and controls.* Under the description of measures and controls in the storm water pollution prevention plan requirements, this section proposes that all areas that may contribute pollutants to storm water discharges shall be maintained in a clean, orderly manner. This section also proposes that the following areas must be specifically addressed:

(a) *Storage areas for raw, semiprocessed, or finished tannery by-products*—Pallets and/or bales of raw, semiprocessed, or finished tannery by-products (e.g., splits, trimmings, shavings, etc.) that are stored where there is potential storm water contact, must be stored indoors or protected by polyethylene wrapping, tarpaulins, roofed storage area or other suitable means. Materials should be placed on an impermeable surface, the area should be enclosed or bermed or other equivalent measures should be employed to prevent runoff or runoff of storm water.

(b) *Material storage areas*—Label storage units of all materials (e.g., specific chemicals, hazardous materials, spent solvents, waste materials). Maintain such containers and units in good condition. Describe measures that prevent or minimize contact with storm water. The facility must consider indoor storage and/or installation of berming and diking around the area to prevent runoff or runoff of storm water.

(c) *Buffing/shaving areas*—The plan must describe measures that prevent or minimize contamination of the storm water runoff with leather dust from buffing/shaving areas. The facility may consider dust collection enclosures, preventive inspection/maintenance programs or other appropriate preventive measures.

(d) *Receiving, loading, and storage areas*—The plan must describe measures that prevent or minimize contamination of the storm water runoff from receiving, unloading, and storage areas. Exposed receiving, unloading and storage areas for hides and chemical supplies should be protected by a suitable cover, diversion of drainage to the process sewer, directing rain gutters away from loading/receiving areas, grade berming or curbing area to prevent runoff of storm water or other appropriate preventive measures.

(e) *Outdoor storage of contaminated equipment*—The plan must describe measures that minimize contact of storm water with contaminated equipment. Equipment should be protected by suitable cover, diversion of drainage to the process sewer, thorough cleaning

prior to storage or other appropriate preventive measures.

(f) *Waste management*—The plan must describe measures that prevent or minimize contamination of the storm water runoff from waste storage areas. The facility may consider inspection/maintenance programs for leaking containers or spills, covering dumpsters, moving waste management activities indoors, covering waste piles with temporary covering material such as tarpaulin or polyethylene, and minimizing storm water runoff by enclosing the area or building berms around the area.

(g) *Vehicle maintenance and fueling*—Permittees must follow all applicable requirements described in Part XI.P. for controlling storm water discharges from vehicle maintenance and refueling areas.

(h) *Improper connections to storm sewers*—The plan must describe measures which prevent and prohibit washwaters from processing areas from entering storm sewers. The facility must install safeguards against wash waters entering storm sewers and train employees on proper disposal practices for disposal of all process waste materials.

These areas are sources of pollutants in storm water from leather tanning facilities. EPA believes that the incorporation of BMPs such as those suggested, in conjunction with the pollution prevention plan, will substantially reduce the potential of storm water contamination from these areas. Based upon the information provided in part 1 of the group application process, some of the suggested management processes are being used at leather tanning facilities. In addition, EPA believes that these requirements continue to provide the necessary flexibility to address the variable risk for pollutants in storm water discharges associated with different facilities. Further, many facilities will find that management measures that they have already incorporated into the facilities operation, such as the use of covers and roofing, containers, and berms and dikes will meet the requirements of this section.

• *Preventive Maintenance*—Under the preventive maintenance requirements of the pollution prevention plan, permittees are required to develop a preventive maintenance program that includes regular inspections and maintenance of storm water BMPs. The maintenance program requires periodic removal of debris from discharge diversions. Permittees using ponds to control their effluent limitation

frequently use impoundments or sedimentation ponds as their BAT/BCT.

Maintenance schedules and maintenance measures for these ponds must be provided in the pollution prevention plan.

The purpose of the inspections is to check on the accuracy of the description of potential pollution sources contained in the plan, determine the effectiveness of the plan and implementation of the storm water pollution prevention plan. The inspections allow facility personnel to monitor the success or failure of elements of the plan on a regular basis. The use of an inspection checklist is recommended. The checklist will ensure that all required areas are inspected, as well as help to meet the record keeping requirements. Based on the results of each inspection, the description of potential pollution sources, and measures and controls, the plan must be revised as appropriate within 2 weeks after each inspection. Changes in the measures and controls must be implemented on the site in a timely manner, and never more than 12 weeks after completion of the inspection.

• *Inspections*—Under the inspection requirements of the storm water pollution prevention plan elements, qualified facility personnel shall be identified to inspect designated areas of the facility, at a minimum of every 3 months. The individual or individuals who will conduct the inspections must be identified in the plan and should be members of the pollution prevention team. The following areas shall be included in all inspections: storage areas for equipment and vehicles awaiting maintenance, facility yard area where outdoor storage occurs, receiving and unloading areas and waste management areas. A set of tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections. Records of inspections shall be maintained and the pollution prevention plan modified where necessary.

In addition, qualified personnel must conduct quarterly visual inspections of all BMPs. The inspections shall include an assessment of the effectiveness and need for maintenance of storm water roofing and covers, dikes and curbs, discharge diversions, sediment control and collection systems and all other BMPs.

Quarterly visual inspections must be made at least once in each of the following designated periods during daylight hours. December–February (storm water runoff or snow melt), March–May (storm water runoff), June–

August (storm water runoff), and September–November (snow melt runoff). Records shall be maintained as part of the pollution prevention plan.

- **Employee Training**—Under the employee training component of the storm water pollution prevention plan requirements, the permittee is required to identify annual (once per year) dates for training. Employee training must, at a minimum, address the following areas when applicable to a facility: General good housekeeping practices, spill prevention and control, waste management, inspections, preventive maintenance, detection of non-storm water discharges and other areas.

- **Record Keeping and Internal Reporting**—Permittees must describe procedures for developing and retaining records on the status and effectiveness of plan implementation. The plan must address spills, monitoring, and BMP inspection and maintenance activities. Ineffective BMPs must be reported and the date of their corrective action recorded. Employees must report incidents of leaking fluids to facility management and these reports must be incorporated into the plan.

- **Storm Water Management**—The permittee must evaluate the appropriateness of each storm water BMP that diverts, infiltrates, reuses, or otherwise reduces the discharge of contaminated storm water. In addition, the permittee must describe the storm water pollutant source or activity (i.e., loading and unloading operations, raw material storage piles, waste piles, etc.) to be controlled by each storm water management practice.

(3) **Comprehensive site compliance evaluation.** The storm water pollution prevention plan must describe the scope and content of comprehensive site inspections that qualified personnel will conduct to: (1) Confirm the accuracy of the description of potential pollution sources contained in the plan; (2) determine the effectiveness of the plan; and (3) assess compliance with the terms and conditions of this section. Comprehensive site compliance evaluations should be conducted twice a year for leather tanning facilities. These inspections are intended to be more in depth than the quarterly visual inspections. The individual or individuals who will conduct the inspections must be identified in the plan and should be members of the pollution prevention team. Inspection reports must be retained for at least 3 years after the date that the permit expires. Based on the results of each inspection, the description of potential pollution sources, and measures and controls, the plan must be revised as

appropriate within 2 weeks after each inspection. Changes in the measures and controls must be implemented on the site in a timely manner, and never more than 12 weeks after completion of the inspection.

6. Numeric Effluent Limitations

There are no numeric effluent limitations for storm water discharges from leather tanning facilities beyond those described in Part VI.E. of the fact sheet.

7. Monitoring and Reporting Requirements

a. **Analytical monitoring requirements.** EPA believes that leather tanning and finishing facilities may reduce the level of pollutants in storm water runoff from their sites through the development and proper implementation of the storm water pollution prevention plan requirements discussed in today's proposed permit. In order to provide a tool for evaluating the effectiveness of the pollution prevention plan and to characterize the discharge for potential environmental impacts, the proposed permit requires leather tanning and finishing facilities to collect and analyze samples of their storm water discharges for the pollutants listed in Table Z-5. The pollutants listed in Table Z-5 were found to be above levels of concern for a significant portion of leather tanning and finishing facilities that submitted quantitative data in the group application process, or are believed to be present based upon the description of industrial activities and significant materials exposed. Because these pollutants have been reported at levels of concern from leather tanning and finishing facilities, EPA is requiring monitoring after the pollution prevention plan has been implemented to assess the effectiveness of the pollution prevention plan and to help ensure that a reduction of pollutants is realized.

At a minimum, storm water discharges from leather tanning and finishing facilities must be monitored quarterly during the second year of permit coverage. At the end of the second year of permit coverage, a facility must calculate the average concentration for each parameter listed in Table Z-5. If the permittee collects more than four samples in this period, then they must calculate an average concentration for each pollutant of concern for all samples analyzed.

TABLE Z-5.—INDUSTRY MONITORING REQUIREMENTS

| Pollutants of concern | Cut-off concentration (mg/L) |
|---|------------------------------|
| Biochemical Oxygen Demand (BOD ₅) | 9.0 |
| Total Kjeldahl Nitrogen (TKN) .. | 1.5 |
| Nitrate and Nitrite Nitrogen | 0.68 |
| Total Recoverable Aluminum ... | 0.75 |
| Total Recoverable Manganese | 0.05 |

If the average concentration for a parameter is less than or equal to the value listed in Table Z-5, then the permittee is not required to conduct quantitative analysis for that parameter during the fourth year of the permit. If, however, the average concentration for a parameter is greater than the cut-off concentration listed in Table Z-5, then the permittee is required to conduct quarterly monitoring for that parameter during the fourth year of permit coverage. Monitoring is not required during the first, third, and fifth year of the permit. The exclusion from monitoring in the fourth year of the permit is conditional on the facility maintaining industrial operations and BMPs that will ensure a quality of storm water discharges consistent with the average concentrations recorded during the second year of the permit. Table Z-6 provides a schedule of monitoring requirements.

TABLE Z-6.—SCHEDULE OF MONITORING

| 2nd Year of Permit Coverage. | |
|------------------------------|--|
| | <ul style="list-style-type: none"> • Conduct quarterly monitoring. • Calculate the average concentration for all parameters analyzed during this period. • If average concentration is greater than the value listed in Table Z-5, then quarterly sampling is required during the fourth year of the permit. • If average concentration is less than or equal to the value listed in Table Z-5, then no further sampling is required for that parameter. |

TABLE Z-6.—SCHEDULE OF MONITORING—
Continued

| | |
|------------------------------|--|
| 4th Year of Permit Coverage. | <ul style="list-style-type: none"> • Conduct quarterly monitoring for any parameter where the average concentration in year 2 of the permit is greater than the value listed in Table Z-5. • If industrial activities or the pollution prevention plan have been altered such that storm water discharges may be adversely affected, quarterly monitoring is required for all parameters of concern. |
|------------------------------|--|

In cases where the average concentration of a parameter exceeds the cut-off concentration, EPA expects permittees to place special emphasis on methods for reducing the presence of those parameters in storm water discharges. Quarterly monitoring in the fourth year of the permit will reassess the effectiveness of the adjusted pollution prevention plan.

The monitoring cut off concentrations listed in Table Z-5 are not numerical effluent limitations. These values represent a level of pollutant discharge which facilities may achieve through the implementation of pollution prevention plans. At least half of the facilities which submitted Part 2 data, reported concentrations less than or equal to the values listed in Table Z-5. Facilities that achieve average discharge concentrations which are less than or equal to the values in Table Z-5 are not relieved from the pollution prevention plan requirements or any other requirements of the permit.

b. Alternative certification. Throughout today's permit, EPA has proposed monitoring requirements for facilities which the Agency believes have the potential for contributing significant levels of pollutants to storm water discharges. The alternative described below is necessary to ensure that monitoring requirements are only imposed on those facilities that do, in fact, have storm water discharges containing pollutants at concentrations of concern. EPA has determined that if materials and activities are not exposed to storm water at the site, then the potential for pollutants to contaminate storm water discharges does not warrant monitoring.

Therefore, a discharger is not subject to the monitoring requirements of this Part provided the discharger makes a certification for a given outfall, on an annual basis, under penalty of law, signed in accordance with Part VII.G. (Signatory Requirements), that material handling equipment or activities, raw

materials, intermediate products, final products, waste materials, by-products, industrial machinery or operations, significant materials from past industrial activity, and deicing activities, that are located in areas of the facility that are within the drainage area of the outfall are not presently exposed to storm water and will not be exposed to storm water for the certification period. Such certification must be retained in the storm water pollution prevention plan and submitted to EPA in accordance with Part VI.D of this permit.

c. Reporting requirements. Permittees are required to submit all monitoring results obtained during the second and fourth year of permit coverage within 3 months of the conclusion of each year. Such permittees must submit monitoring results on four separately signed Discharge Monitoring Report Forms to the Director. For facilities conducting monitoring beyond the minimum quarterly requirements an additional Discharge Monitoring Report Form must be filed for each analysis.

d. Sample type. All discharge data shall be reported for grab samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable.

If storm water discharges associated with industrial activity commingle with process or nonprocess water, then where practicable permittees must attempt to sample the storm water discharge before it mixes with the non-storm water discharge.

EPA requests comments upon a condition of today's proposed permit that would require permittees who are unable to sample storm water discharges before they commingle with non-storm water discharges to sample the combined discharge both during dry and wet weather and submit both sets of data to the permitting authority.

e. Representative discharge. When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes

discharge substantially identical effluents, the permittee may test the effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluent. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

f. Monthly visual examination of storm water quality. Monthly visual inspections of a storm water discharge from each outfall are required for leather tanning and finishing facilities. The inspection must be of a grab sample collected from each storm water outfall. The examination of storm water grab samples shall include any observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, or other obvious indicators of storm water pollution. The inspection must be conducted in a well-lit area. No analytical tests are required to be performed on these samples.

The examination must be made at least once in each month of the permit during daylight unless there is insufficient rainfall or snow-melt to runoff. EPA expects that, whenever practicable, the same individual should carry out the collection and examination of discharges throughout the life of the permit to ensure the greatest degree of consistency possible. Grab samples shall be collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 60 minutes) of when the runoff begins discharging. Reports of the visual observation include: The examination date and time, examination personnel, visual quality of the storm water discharge, and probable sources of any observed storm water contamination. The visual observation reports must be maintained onsite with the pollution prevention plan.

When a discharger is unable to collect samples over the course of the monitoring period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds,

hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

EPA believes that this quick and simple assessment will allow the permittee to approximate the effectiveness of his/her plan on a regular basis at very little cost. Although the visual examination cannot assess the chemical properties of the storm water discharged from the site, the examination will provide meaningful results upon which the facility may act quickly. The frequency of this visual

inspection will also allow for timely adjustments to be made to the plan. If BMPs are performing ineffectively, corrective action must be implemented. A set of tracking or follow-up procedures must be used to ensure that appropriate actions are taken in response to the inspections. The visual examination is intended to be performed by members of the pollution prevention team. This hands-on inspection will enhance the staff's understanding of the storm water problems on that site and the effects of

the management practices that are included in the plan.

8. Alternative Monitoring Requirements

EPA requests comment upon the following monitoring and reporting requirements in lieu of those listed in Part XI.Z.7 of today's proposed permit.

a. Leather tanning facilities not reporting under section 313 of SARA title III. (1) During the period beginning on the effective date and lasting through the expiration date of this permit, permittees would be required to monitor those storm water discharges identified in Table Z-7 below at least annually.

Table Z-7

| Parameter | Unit | Frequency ¹ | Sample Type ² |
|-------------------------------|---------|------------------------|--------------------------|
| BOD5 | mg/L | annually ... | grab. |
| COD | mg/L | do | Do. |
| Total Kjeldahl Nitrogen | mg/L | do | Do. |
| Oil and Grease | mg/L | do | Do. |
| pH | s.u. .. | do | Do. |
| Total Phosphorus | mg/L | do | Do. |
| Total Suspended Solids | mg/L | do | Do. |
| Chromium, Total | mg/L | do | Do. |

In addition to the parameters listed above, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event which generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

¹Samples shall be taken annually over the term of the permit.

²The grab sample shall be collected in the first 30 minutes of the discharge or as soon thereafter as practical, but not to exceed 60 minutes.

b. Leather tanning facilities reporting under section 313 of SARA title III. (1) Facilities reporting under Section 313 would monitor their storm water discharges according to the requirements listed at Part VI.

c. Quarterly visual examination of storm water quality. (1) Facilities shall perform and document a visual examination of storm water quality of all storm water discharges associated with industrial activity including but not limited to loading and unloading areas, chemical storage areas, vehicle and equipment maintenance activities, equipment cleaning operations, refuse areas and waste management areas. If the storm water from such operations flows such that there are numerous small points of discharge, one visual examination of one representative discharge may be conducted as a representation of the adjacent flows. The examination must be made at least once in each designated period [described in Part (2) (below)] during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(2) Examinations shall be conducted in each of the following periods for the purposes of inspecting storm water

quality associated with storm water runoff and snow melt: December to February (storm water runoff or snow melt); March to May (storm water runoff); June to August (storm water runoff); and September to November (storm water runoff or snow melt).

(3) Visual examinations shall be conducted within the first 30 minutes (or as soon thereafter as practical, but not to exceed 60 minutes) of when the runoff begins discharging. The examinations shall include any observations of color, odor, turbidity, floating solids, foam, oil sheen, or other obvious indicators of storm water pollution. No analytical tests are required to be performed on these samples. Examinations shall be conducted so as to provide a reasonable representation of the nature of a typical storm water discharge at that site during that time of year.

(4) Information must be maintained on site and include: the examination date and time, examination personnel, visual quality of the storm water discharge, and probable sources of any observed storm water contamination.

(5) When a discharger is unable to collect samples over the course of the monitoring period as a result of adverse

climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

d. Reporting: When to submit. (1) Permittees with facilities identified in Part XI.Z.8.a. [Leather Tanning Facilities Not Reporting Under Section 313 of Superfund Amendments and Reauthorization Act (SARA) Title III] are not required to submit monitoring results, unless required in writing by the Director.

(2) Permittees with facilities identified in Part XI.Z. (Leather Tanning Facilities Reporting Under Section 313 of SARA Title III) must conduct monitoring and submit the results according to the requirements listed at Part VI.

9. Retention of Records

a. The permittee shall retain records of all inspections and monitoring

information, including certification reports, noncompliance reports, calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of all reports, and supporting data, requested by the permitting authority for at least 3 years after the date that the permit expires.

AA. Storm Water Discharges Associated With Industrial Activity From Fabricated Metal Products Industry

1. Discharges Covered Under This Section

On November 16, 1990 [55 Federal Register (FR) 47990], the U.S. Environmental Protection Agency (EPA) promulgated the regulatory definition of "storm water discharges associated with industrial activity." This section of today's proposed permit covers storm water discharges associated with industrial activities from metal fabrication processes and operations. Fabricated metal and processing facilities eligible for coverage under this section include the following types of operations:

- Fabricated Metal Products, Except Machinery and Transportation Equipment, Standard Industrial Classification (SIC) code 34 (3429, 3441, 3442, 3443, 3444, 3451, 3452, 3462, 3465, 3471, 3479, 3494, 3496, 3499)
- Jewelry, Silverware, and Plated Ware, SIC code 391.

This section covers establishments engaged in fabricating ferrous and nonferrous metal products, such as metal cans, tinware, general hardware, automotive parts, tanks, road mesh, structural metal products, nonelectrical equipment, and a variety of metal and wire products from purchased iron or steel rods, bars, or wire materials. This section does not cover discharges from establishments engaged in manufacturing and rolling of ferrous and nonferrous metals, forgings or stampings, electrolytic or other processes for refining copper from ore. These establishments are addressed in a separate section of today's proposed permit. Therefore, if a given storm water discharge is addressed by more than one set of industry specific conditions, the requirements for the applicable classes of activities apply.

Storm water discharges covered by this section include all discharges where precipitation and storm water runoff come into contact with industrial

activity including such things as: raw materials, waste products, by-products, overburden, stored materials, and fuels. This includes storm water discharges from haul roads, access roads, industrial plant yards, and rail lines used or traveled by carriers of raw materials, manufactured product, waste materials, or by-products created by the facility.

Impacts caused by storm water discharges from fabricating operations will vary from one facility to the next. Several factors influence to what extent significant materials from fabricators will affect water quality. Specifically, the use of indoor operations as opposed to outdoor storage facilities; discharges to Publicly Owned Treatment Works (POTWs); recycling programs; product choice in the various operations; and the number of operations that take place at a given facility based on customer needs; and use of storm water controls.

When an industrial facility, described by the above eligibility provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

If monitoring and pollution prevention plan requirements of another industrial activity section of this permit apply to co-located industrial activities at an industrial facility, the eligibility provisions of that industrial activity section shall not preclude the operator of the industrial facility from complying with the applicable monitoring and pollution prevention plan requirements of that section.

This section does not cover any discharge subject to process wastewater effluent limitation guidelines, including storm water that combines with process wastewater.

2. Industrial Profile

These facilities are engaged in the manufacturing of a variety of products

that are constructed primarily by using metals. The operations performed usually begin with materials in the form of raw rods, bars, sheet, castings, forgings, and other related materials and can progress to the most sophisticated surface finishing operations. There are typically several operations that take place at a fabrication facility: machining operations, grinding, cleaning and stripping, surface treatment and plating, painting, and assembly. The machining operation involves turning, drilling, milling, reaming, threading, broaching, grinding, polishing, cutting and shaping, and planing. Grinding is the process using abrasive grains such as aluminum oxide, silicon carbide, and diamond to remove stock from a workpiece. Cleaning and stripping is a preparatory process involving solvents for the removal of oil, grease and dirt. Both alkaline and acid cleaning are employed. Surface treatment and plating is a major component that involves batching operations to increase corrosion or abrasion resistance. This is generally in the form of galvanizing. Painting is generally practiced at most facilities to provide decoration and protection to the product or item. Assembly is the fitting together of previously manufactured parts into a complete unit or structure.

Industrial activities and storm water management practices are typically similar in the fabricating industry, varying mostly in the type of chemicals used in the processes and the final product. Examples of products being fabricated in this industry include: aircraft engines, screws, nuts, bolts, automotive parts (drive shafts, struts, gears, rods), tanks, hand tools, doors, and bridge grates.

Many of the operations in this industry take place indoors. The major activities evaluated for purposes of storm water contamination and control measures include: waste storage, outside product storage, use of pickling acids, storage of cutoff scrap metal, aluminum scraps, hazardous materials, galvanized steel components, solvent storage, waste paper storage, machinery storage, and maintenance of existing Best Management Practices (BMPs). The table below lists the most likely wastes to be generated at a steel fabricating facility.

TABLE AA-1.—WASTES GENERATED FROM FABRICATED METALS INDUSTRIES

| Type of waste | Activity | Source |
|--|--|--|
| Used metal working fluid with fine metal dust. | Tool workpiece interface/shaving, chip-ping. | Metal working fluid |
| Spent solvents | Parts/tools cleaning, sand blasting, metal surface cleaning, removal of applied chemicals. | Solvent cleaners, abrasive cleaners, alkaline cleaners, acid cleaners, rinse waters. |
| Cuttings, scraps, turnings, fines | Making structural components | Raw metals. |
| Paint, spent stripping solutions | Painting operations | Paints, solvents, and painting equipment. |

3. Storm Water Sampling Results

Table AA-2 summarizes the storm water monitoring results for the pollutants required by Part A of form 2F that were reported by facilities in this sector. Table AA-2 provides composite sample data and grab sample results.

TABLE AA-2.—STATISTICS FOR CONVENTIONAL AND NONCONVENTIONAL POLLUTANTS FOR THE FABRICATED METAL PRODUCTS INDUSTRY (MG/L EXCEPT AS NOTED)ⁱ

| Pollutant Sample type | # of Samples | | Mean | | Minimum | | Maximum | | Median | | 95th Percentile | | 99th Percentile | |
|--------------------------------|--------------|--------------------|--------|-------|---------|------|---------|-------|--------|-------|-----------------|-------|-----------------|-------|
| | Grab | Comp ⁱⁱ | Grab | Comp | Grab | Comp | Grab | Comp | Grab | Comp | Grab | Comp | Grab | Comp |

| Zinc | 60 | 58 | 4.20 | 2.17 | 0.0 | 0.0 | 157.0 | 22.8 | 0.36 | 0.21 | N/A | N/A | 157.0 | 22.80 |

ⁱ Mean, Minimum, Maximum, and Percentiles include all detects and nondetects.ⁱⁱ Composite samples.

EPA also reviewed the monitoring results for nonconventional and priority toxic pollutants required by Parts B and C of Form 2F. Table AA-3 summarizes the results for parameters where some of the reported values exceeded Effluent

Guideline Limitations or "Gold Book" values and may be the result of industrial activities performed by the metal fabricating industry. The toxic information is limited by the few samples received for this sector.

Therefore, it is difficult to conclude that these toxic pollutants are or are not pollutants of concern in the storm water discharges from facilities in this sector. Additional monitoring is warranted to further characterize these pollutants.

TABLE AA-3.—RESULTS OF PRIORITY TOXIC POLLUTANTS

| Pollutant | Unit | Range— grab sam- ples | Range— composite samples | Effluent guideline limits/CFR |
|------------|------|-----------------------------|--------------------------------|-------------------------------------|
| Zinc | mg/L | .021–157 | 0.12–22.8 | 1.0 (440) |
| Iron | mg/L | 0.06–25.1 | 0.06–26.0 | 7.0 (434) |
| Lead | mg/L | 0.04–0.16 | 0.018–0.22 | .6 (440) |

¹ Gold book value for acute fresh water.

a. Summary of pollutants of concern.

More than 50 percent of the facilities in the sector reported concentrations for TSS to be above 76 milligrams per liter (mg/L), which is above the effluent limitation guideline for coal pile runoff of 50 mg/L. The minimum grab TSS concentration was 0 mg/L and the mean grab concentration was 187 mg/L. In comparison to other industry sectors in today's proposed permit, these levels warrant concern. About 80 percent of the facilities in this sector indicated that most of the facilities are devoid of vegetation and ground surfaces were barren. EPA believes that this condition and the use of heavy equipment causing erosion and conveyances for storm water runoff, along with any pollutants collected in the soil can contribute to the high levels of Total Suspended Solids reported in the analytical data. In addition, concentrations of aluminum, zinc, iron, copper, and manganese varied widely, but in some cases, exceeded "Gold Book" values.

4. Options for Controlling Pollutants

The measures to control pollutants at metal fabricating operations should focus primarily on the storage of waste and raw materials; chemical storage areas; and equipment storage and

service areas. Since most of the operations occur indoors, procedures are necessary in the handling and transporting of materials to minimize exposure of pollutants to storm water runoff. Of primary importance is the control of activities and use of chemicals that have been identified as potential sources of pollutants. The most effective discharge controls for these facilities are BMPs targeted toward source control. This includes utilizing inside storage as much as possible; and implementing programs for recycling scrap materials. Many of these practices require the use of covers, indoor storage, and indoor operations. Some structural measures would provide an additional control to reduce the potential for exposure at these facilities. These include source reduction diversion dikes, grass swales, vegetative covers, and sedimentation ponds. Preventive controls are typically low in cost and relatively easy to implement, as the majority of the facilities in this industry already employ these practices. In addition, directing flows to privately owned treatment works or retention ponds will be the most effective measure. The industry also must give consideration to the non-storm water discharges associated with improper

disposal of materials from the indoor processes due to the extensive use of chemicals in the preparation and finishing phases of metal preparation and fabrication. The industry also involves grinding, welding, and sanding operations that will require special consideration to control potential pollutants that could accumulate and be subject to storm water runoff. Most of the measures commonly implemented to reduce pollutants in storm water associated with the fabricated metals industry are generally uncomplicated practices. Some of the practices may be predicated on the size of the operation, the types of processes that are exercised from a full-scale plant operation to a more specialized company that conducts only a portion of the operations usually found in the fabricating industry. Table AA-4 below is an outline of the most common activities and sources that may produce pollutants associated with different activities that routinely take place at fabricated metal industries. Following the table is a brief list of BMPs that EPA believes will help reduce and control the potential pollutant sources at fabricating facilities from contaminating storm water.

Table AA-4.—POLLUTANTS POTENTIALLY FOUND IN STORM WATER DISCHARGES ASSOCIATED WITH THE FABRICATED METAL INDUSTRY

| Activity | Pollutant source | Pollutant |
|-------------------------|---|---|
| Metal preparation | Grinding, welding, sawing, shaving, brazing, bending, cutting, etching. | Steel scraps, aluminum scraps, brass, copper, dust, chips and borings, steel scale, teflon, manganese. |
| Parts cleaning | Solvents, cold and hot dips, cleaning parts, degreasing. | Acid, coolants, clean composition, degreaser, mineral spirits, pickle liquor, spent caustic, sludge. |
| Surface Treatment | Finishing, plating, case hardening, chemical coating, coating, polishing, rinsing, abrasive cleaning, electroplating. | Acid, aromatic solvent, corn cob, lubricants, sand, oil, pH, nitrates, nitrites, carbon, phosphates, borates, nitrogen, oily sludge, nickel, chromium, hydrofluoric acid. |
| Galvanizing | Spills, leaks, transporting materials | Acid solution, phosphates, zinc chromate hexavalent chromium, nickel. |
| Painting | Empty containers, paint application wastes, spills, over spraying, storage areas. | Paint wastes, thinner, varnish, heavy metals, spent chlorinated solvents. |

Table AA-4.—POLLUTANTS POTENTIALLY FOUND IN STORM WATER DISCHARGES ASSOCIATED WITH THE FABRICATED METAL INDUSTRY—Continued

| Activity | Pollutant source | Pollutant |
|--|--|--|
| Heavy equipment use and storage | Leaking fluids, fluids replacement, washing equipment, use on poor surface area, soil disturbance. | Oil, heavy metals, organics, fuels, TSS, hydraulic oil, diesel fuel, gasoline. |
| Equipment maintenance | Leaking fluids, fluids replacement, washing equipment. | Oil, grease. |
| Storage of uncoated structural steel ... | Stored on porous pavement | Aluminum, lead, zinc, copper, iron, oxide, oil, nickel, manganese. |
| Storing galvanized steel directly on the ground. | Galvanizing material drippage or leaching | Metals: zinc, nickel, cadmium, chromium. |
| Vehicle/equipment traffic | Soil disturbance and erosion | TSS from erosion, hydraulic fluid loss/spillage. |
| Cleaning equipment/vehicles | Chemicals disposed improperly, spillage | Oil, grease, surfactants, chromates, acid, hydroxide, nitric acid. |
| Storage areas | Unidentifiable drums, extended exposure to weather conditions, tank corrosion, open containers. | Benzene, toluene, xylene, pyrene, and other volatile organics, solvents. |
| Equipment usage | Malfunctioning equipment, stockpiled obsolete equipment. | Oil, grease, lead. |
| Above ground storage tanks | Installation problems, spills, external corrosion and structural failure. | Fuel oil and various chemicals. |

Table AA-4 above shows the potential pollutants that could end up in storm water runoff if the activities typically found at a fabricating facility are not handled properly. Many of the fabricating facilities in the group application indicated several of the activities listed as a part of the normal operations carried out at the facility. Many of the pollutants involved in these activities are potentially of concern if exposed to precipitation and storm water runoff. Consideration of control measures is needed to assure that the activities minimize exposure to the potential pollutants of concern as it relates to each activity identified and control the potential sources that may generate pollutants as part of the management practices used.

5. Special Conditions

The permit conditions that apply to the fabricated metals industry build upon the requirements set forth in the general baseline permit for storm water discharges from industrial activities finalized on September 9, 1992 (57 FR 41236). The discussion that follows, therefore, only addresses conditions that differ from those required in the baseline permit.

Due to the concern that many non-storm water discharges may be present at metal fabricators, EPA is requiring that all facilities provide proof that these discharges are not commingled and are appropriately controlled so as to protect all receiving waters.

Today's proposed permit clarifies in Part XI.AA.2. (Prohibition of Non-storm Water Discharges) that non-storm water discharges, including metal fabricator operations, are not authorized by this section. The operators of such non-storm water discharges must obtain

coverage under a separate National Pollutant Discharge Elimination System (NPDES) permit if discharged to waters of the United States or through a municipal separate storm sewer system. In a related requirement under the storm water pollution prevention plan requirements, the permittee is required to attach a copy of the NPDES permit issued for metal acid baths, sludge disposal, scrap disposal or recycling or, if an NPDES permit has not yet been issued, a copy of the pending application plan. Facilities that pretreat and discharge the waste water into a POTW system must notify the operator and a copy of the notification must be attached to the plan. With regard to all the acid baths, wash waters, and any other non-storm water discharges must be considered in the plan. Some facilities may use retention ponds, recycling, collecting and hauling as methods of disposal. Other facilities discharge into separate storm sewer systems. In these instances, the facility is required to attach the disposal plans and operations to the plan.

6. Storm Water Pollution Prevention Plan Requirements

Each storm water pollution prevention plan must stipulate activities, materials, and physical features of the facility that may contribute to storm water runoff or, during periods of dry weather, result in dry weather flows. The metals fabricating industry plan will need to focus primarily on storage areas, unloading and loading areas, and any other areas where outside operations occur.

Under the description of measures and controls in the storm water pollution prevention plan requirements,

this section proposes that all areas that may contribute pollutants to storm water discharges shall be maintained in a clean, orderly manner. This section also proposes that the following areas must be specifically addressed:

a. Potential best management practices in relationship to various activities at fabricating facilities. (1) Metal fabricating areas. These areas should be kept clean by frequent sweeping to avoid heavy accumulation of steel ingots, fines, and scrap. Dust is a byproduct of many processes in the fabricating areas and therefore should be absorbed through a vacuum system to avoid accumulation on roof tops and onto the ground. Tracking of metal dusts and metal fines outdoors can be minimized by employing these management practices.

- Sweep on a regular basis all accessible paved areas.
- Maintain floors in a clean and dry condition.
- Remove waste and dispose of regularly.
- Remove obsolete equipment expeditiously.
- Sweep fabrication areas.
- Train employees on good housekeeping measures.

(2) Storage areas for raw metal. The storage of raw materials should be under a covered area whenever possible and protected from contact with the ground. The amount of material stored should be minimized to avoid corrosive activity from long-term exposed materials. Diking or berming the area to prevent or minimize run-on may be considered. Long-term exposure to weather conditions results in oxidation of the metals. Also, dirt, oil, and grease buildup on the metal are potential sources of pollutants.

- Check raw metals for corrosive activity.
- Keep area neat and orderly, stack neatly on pallets or off the ground.
- Cover exposed materials.

(3) *Receiving, unloading, and loading areas.* These areas should be enclosed where feasible using either curbing, berming, diking or other accepted containment systems in case of spills during delivery of chemicals such as lubricants, coolants, rust preventatives, solvents, oil, sodium hydroxide, hydrochloric acid, calcium chloride, polymers, sulfuric acid, and other chemicals used in the metal fabricating processes. Directing roof down spouts away from loading sites and equipment and onto grassy or vegetated areas should help prevent storm water contamination by pollutants that have accumulated in these areas.

- Clean up spills immediately.
- Check for leaks and remedy problems regularly.
- Unload under covered areas when possible.

(4) *Storage of heavy equipment.* Vehicles should be stored indoors when possible. If stored outdoors the use of gravel, concrete or other porous surfaces should be considered to minimize or prevent heavy equipment from creating ditches or other conveyances that would cause sedimentation runoff and increase TSS loadings. Also directing the flow toward the area by the use of grass swales or filter strips will reduce the runoff of materials. Directing drainage systems away from high traffic areas into collection systems will help to reduce the TSS loadings caused by exposed and eroding open areas.

- Clean prior to storage or store under cover.
- Store indoors.
- Divert drainage to the grass swales, filter strips, retention ponds, or holding tanks.

(5) *Metal working fluid areas.* Due to the toxicity of metal working fluids as well as the contamination of fluids by metal fines and dusts, spillage and loss of metal working fluids used to cleanse or prepare the steel components should be controlled throughout the process. Collection systems and storage areas need special consideration.

- Store used metal working fluid with fine metal dust indoors.
- Use tight sealing lids on all fluid containers.
- Use straw, clay absorbents, sawdust, or synthetic absorbents to confine or contain any spills, or other absorbent material.

- Establish recycling programs for used fluids when possible.

(6) *Unprotected liquid storage tanks.* Storing these tanks (this does not

include products that are gaseous at atmospheric pressure) indoors will reduce potential waste or spills from contaminating storm water. Berming outdoor areas when unable to store inside will contain potential pollutants. Cleaning up spills is essential to minimizing buildup in these areas. EPA believes that this will significantly reduce the potential for major discharges into the water of the United States during storm runoff.

- Cover all tanks whenever possible.
- Berm tanks whenever possible.
- Dike area or install grass filters to contain spills.

- Keep area clean.
- Check piping, valves and other related equipment on a regular basis.

(7) *Chemical cleaners and rinse water.* Proper disposal and use of cleaners in various activities will minimize the amount of liquid exposed to storm water by reducing the need to store contaminated liquids for an extended period of time. Controlling potential contamination of pollutants by employing simple control devices during the activity will prevent potential contamination in storm water runoff. Recycling or reuse of these materials whenever possible serves as a source reduction by reducing the necessary amount of new materials.

- Use drip pans and other spill devices to collect spills or solvents and other liquid cleaners.
- Recycle waste water.
- Store recyclable waste indoors or in covered containers.
- Substitute nontoxic cleaning agents when possible.

(8) *Raw steel collection areas.* The collection areas must be kept clean. Materials should be kept in a covered storage bin or kept inside until pickup. The use of pitched-structures should be considered.

- Collect scrap metals, fines, iron dust and store under cover.
- Recycle.

(9) *Paints and painting equipment.* Facilities using tarps, drip pans, or other spill collection devices to contain and collect spills of paints, solvents or other liquid material. Blasting in windy weather increases the potential for runoff. Enclosing outdoor sanding areas with tarps or plastic sheeting contains the finds of metal. Immediate collection of any waste and proper disposal may significantly contribute to the reduction of storm water runoff. Training employees to use the spray equipment properly may reduce waste and decrease the likelihood of accidents, as well as, reduce the amount of solvents needed to complete the job.

- Paint and sand indoors when possible.

- Avoid painting and sandblasting operations outdoors in windy weather conditions.

- If done outside, enclose sanding and painting areas with tarps or plastic sheeting.

- Use water-based paints when possible to decrease.

(10) *Vehicle and equipment maintenance areas.* Changing fluids or parts should be done indoors when possible. If maintenance is performed outdoors, fluids used in maintaining these vehicles should be contained in the area by using drip pans, large plastic sheets, canvas or other similar controls under the vehicles, or berming the area. Hydraulic fluids should be properly stored to prevent leakage and storm water contamination.

- Berm area or use other containment device to control spills.

- Use drip pans, plastic sheeting and other similar controls.

- Discard fluids properly or recycle if possible.

(11) *Hazardous waste storage areas.* All hazardous waste must be stored in sealed drums. Establishing centralized drum-storage satellite areas throughout the complex to store these materials will decrease the potential for mishandling drums. Berming the enclosed structures is added protection in case of spills. Spills or leaks that are contained within an area are easier to contain and prevent storm water contamination or runoff. Checks for corrosion and leakage of storage containers is important. Proper labelling for proper handling might be considered. All other applicable Federal, State, and local regulations must be followed.

- Store indoors.
- Label materials clearly.
- Check for corrosive activity and leaking.

- Properly dispose of outdated materials.

- Dike or use grass swales, ditches or other containment to prevent runoff or runoff in case of spills.

- Post notices prohibiting dumping of materials into storm drains.

- Store containers, drums, and bags away from direct traffic routes.

- Do not stack containers in such a way as to cause leaks or damage to the containers.

- Use pallets to store containers when possible.

- Store materials with adequate space for traffic without disturbing drums.

- Maintain low inventory level of chemicals based on need.

(12) *Transporting chemicals to storage areas.* Proper handling of drums is

needed to avoid damaging drums and causing leaks. Storage areas should be as close as possible to operational buildings.

- Forklift operators should be trained to avoid puncturing drums.

- Store drums as close to operational building as possible.

- Label all drums with proper warning and handling instructions.

(13) *Finished products (galvanized) storage.* Improper storage of finished products can cause a significant amount of erosion and contribute to the TSS levels. Also transporting these materials to the storage areas by the use of heavy equipment increases the possibility of conveyances for storm water runoff of soil and other contaminants from the finished products such as various lubricants and residual traces of metal.

- Use wooden pallets to decrease erosion of soil.

- Store on a concrete pad, gravel surface, or other impervious surface.

(14) *Wooden pallets and empty drums.* Empty drums must be thoroughly cleaned of materials to avoid contamination. Contaminated wooden pallets and empty drums stored outdoors should be stored on concrete pads. Uncovered storage outdoors of uncontaminated wooden pallets is acceptable.

- Clean contaminated wooden pallets.

- Cover empty drums.

- Cover contaminated wooden pallets.

- Store drums and pallets indoors.

(15) *Retention ponds (lagoon).* Creating and maintaining retention ponds as a treatment system for settling out TSS would help to reduce the concentrations of these pollutants in storm water runoff.

- Provide routine maintenance.
- Remove excess sludge periodically.
- Aerate periodically to maintain pond's aerobic character and ecological balance is important.

b. Comprehensive site compliance evaluation. The storm water pollution prevention plan must describe the scope and content of comprehensive site inspections that qualified personnel will conduct to (1) confirm the accuracy of the description of potential pollution sources contained in the plan, (2) determine the effectiveness of the plan, and (3) assess compliance with the terms and conditions of this section. Comprehensive site compliance evaluations should be conducted at least once a year. The individual or individuals that will conduct the inspections must be identified in the plan and should be members of the pollution prevention team. Inspection

reports must be retained for at least 3 years after the date that the permit expires.

Based on the results of each inspection, the description of potential pollution sources, and measures and controls, the plan must be revised as appropriate within 2 weeks after each inspection. Changes in the measures and controls must be implemented on the site in a timely manner, and never more than 12 weeks after completion of the inspection.

7. Numeric Effluent Limitations

There are no additional numeric effluent limitations beyond those described in Part VI of the fact sheet.

8. Monitoring and Reporting Requirements

a. Analytical monitoring requirements. EPA believes that fabricated metal and processing facilities may reduce the level of pollutants in storm water runoff from their sites through the development and proper implementation of the storm water pollution prevention plan requirements discussed in today's proposed permit. In order to provide a tool for evaluating the effectiveness of the pollution prevention plan and to characterize the discharge for potential environmental impacts, the proposed permit requires fabricated metal and processing facilities to collect and analyze samples of their storm water discharges for the pollutants listed in Table AA-5. The pollutants listed in Table AA-5 were found to be above levels of concern for a significant portion of fabricating facilities that submitted quantitative data in the group application process, or are believed to be present based upon the description of industrial activities and significant materials exposed. Because these pollutants have been reported at levels of concern from fabricated metal and processing facilities, EPA is requiring monitoring after the pollution prevention plan has been implemented to assess the effectiveness of the pollution prevention plan and to help ensure that a reduction of pollutants is realized.

At a minimum, storm water discharges from fabricated metal and processing facilities must be monitored quarterly during the second year of permit coverage. At the end of the second year of permit coverage, a facility must calculate the average concentration for each parameter listed in Table AA-5. If the permittee collects more than four samples in this period, then they must calculate an average

concentration for each pollutant of concern for all samples analyzed.

TABLE AA-5.—INDUSTRY MONITORING REQUIREMENTS

| Pollutants of concern | Cut-off concentration (mg/L) |
|-----------------------------------|------------------------------|
| Total Recoverable Aluminum | 0.75 |
| Total Recoverable Copper | 0.009 |
| Total Recoverable Manganese | 0.05 |
| Nitrate+Nitrite Nitrogen | 0.68 |
| Total Recoverable Zinc | 0.065 |
| Total Recoverable Iron | 0.3 |

If the average concentration for a parameter is less than or equal to the value listed in Table AA-5, then the permittee is not required to conduct quantitative analysis for that parameter during the fourth year of the permit. If, however, the average concentration for a parameter is greater than the cut-off concentration listed in Table AA-5, then the permittee is required to conduct quarterly monitoring for that parameter during the fourth year of permit coverage. Monitoring is not required during the first, third, and fifth year of the permit. The exclusion from monitoring in the fourth year of the permit is conditional on the facility maintaining industrial operations and BMPs that will ensure a quality of storm water discharges consistent with the average concentrations recorded during the second year of the permit.

TABLE AA-6.—SCHEDULE OF MONITORING

| 2nd Year of Permit Coverage. | |
|------------------------------|--|
| | <ul style="list-style-type: none"> • Conduct quarterly monitoring. • Calculate the average concentration for all parameters analyzed during this period. • If average concentration is greater than the value listed in Table AA-5, then quarterly sampling is required during the fourth year of the permit. • If average concentration is less than or equal to the value listed in Table AA-5, then no further sampling is required for that parameter. |

TABLE AA-6.—SCHEDULE OF MONITORING—Continued

| | |
|------------------------------|---|
| 4th Year of Permit Coverage. | <ul style="list-style-type: none"> • Conduct quarterly monitoring for any parameter where the average concentration in year 2 of the permit is greater than the value listed in Table AA-5. • If industrial activities or the pollution prevention plan have been altered such that storm water discharges may be adversely affected, quarterly monitoring is required for all parameters of concern. |
|------------------------------|---|

In cases where the average concentration of a parameter exceeds the cut-off concentration, EPA expects permittees to place special emphasis on methods for reducing the presence of those parameters in storm water discharges. Quarterly monitoring in the fourth year of the permit will reassess the effectiveness of the adjusted pollution prevention plan.

The monitoring cut off concentrations listed in Table AA-5 are not numerical effluent limitations. These values represent a level of pollutant discharge which facilities may achieve through the implementation of pollution prevention plans. At least half of the facilities which submitted Part 2 data, reported concentrations less than or equal to the values listed in Table AA-5. Facilities that achieve average discharge concentrations which are less than or equal to the values in Table AA-5 are not relieved from the pollution prevention plan requirements or any other requirements of the permit.

b. Alternative certification. Throughout today's permit, EPA has proposed monitoring requirements for facilities which the Agency believes have the potential for contributing significant levels of pollutants to storm water discharges. The alternative described below is necessary to ensure that monitoring requirements are only imposed on those facilities that do, in fact, have storm water discharges containing pollutants at concentrations of concern. EPA has determined that if materials and activities are not exposed to storm water at the site, then the potential for pollutants to contaminate storm water discharges does not warrant monitoring.

Therefore, a discharger is not subject to the monitoring requirements of this Part provided the discharger makes a certification for a given outfall, on an annual basis, under penalty of law, signed in accordance with Part VII.G. (Signatory Requirements), that material handling equipment or activities, raw

materials, intermediate products, final products, waste materials, by-products, industrial machinery or operations, significant materials from past industrial activity, or, in the case of airports, deicing activities, that are located in areas of the facility that are within the drainage area of the outfall are not presently exposed to storm water and will not be exposed to storm water for the certification period. Such certification must be retained in the storm water pollution prevention plan and submitted to EPA in accordance with Part VI.C of this permit.

c. Reporting requirements. Permittees are required to submit all monitoring results obtained during the second and fourth year of permit coverage within 3 months of the conclusion of each year. Such permittees must submit monitoring results on four separately signed Discharge Monitoring Report Forms to the Director. For facilities conducting monitoring beyond the minimum quarterly requirements an additional Discharge Monitoring Report Form must be filed for each analysis.

d. Sample type. All discharge data shall be reported for grab samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable.

If storm water discharges associated with industrial activity commingle with process or non-process water, then where practicable permittees must attempt to sample the storm water discharge before it mixes with the non-storm water discharge.

EPA requests comments upon a condition of today's proposed permit that would require permittees who are unable to sample storm water discharges before they commingle with non-storm water discharges to sample the combined discharge both during dry and wet weather and submit both sets of data to the permitting authority.

e. Representative discharge. When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes

discharge substantially identical effluents, the permittee may test the effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluent. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area (e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)) shall be provided in the plan.

f. Monthly visual examination of storm water quality. Monthly visual inspections of storm water discharges from each outfall are required at fabricated metal products facilities. The inspection must be of a grab sample collected from each storm water outfall. The examination of storm water grab samples shall include any observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, or other obvious indicators of storm water pollution. The inspection must be conducted in a well lit area. No analytical tests are required to be performed on these samples.

The examination must be made at least once in each month of the permit during daylight unless there is insufficient rainfall or snow-melt to runoff. EPA expects that, whenever practicable, the same individual should carry out the collection and examination of discharges throughout the life of the permit to ensure the greatest degree of consistency possible. Grab samples shall be collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 60 minutes) of when the runoff begins discharging. Reports of the visual observation include: The examination date and time, examination personnel, visual quality of the storm water discharge, and probable sources of any observed storm water contamination. The visual observation reports must be maintained onsite with the pollution prevention plan.

When a discharger is unable to collect samples over the course of the monitoring period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds,

hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

EPA believes that this quick and simple assessment will allow the permittee to approximate the effectiveness of his/her plan on a regular basis at very little cost. Although the visual examination cannot assess the chemical properties of the storm water discharged from the site, the examination will provide meaningful results upon which the facility may act quickly. The frequency of this visual inspection will also allow for timely adjustments to be made to the plan. If BMPs are performing ineffectively, corrective action must be implemented. A set of tracking or follow-up procedures must be used to ensure that appropriate actions are taken in response to the inspections. The visual examination is intended to be performed by members of the pollution prevention team. This hands-on inspection will enhance the staff's understanding of the storm water problems on that site and the effects of

the management practices that are included in the plan.

9. Alternative Monitoring Requirements

EPA requests comment upon the following monitoring and reporting requirements in lieu of those listed in Part XI.AA. of today's proposed permit.

a. Fabricated metal facilities are required under this permit to conduct annual monitoring of their storm water discharges for total suspended solids the first year the permit is issued and annually throughout the life of the permit if the limit exceeds the maximum allowable discharge prescribed under this permit. Permittees are also required to monitor annually for zinc, iron, chromium, cadmium and lead for the term of the permit. In addition, any pollutant limited by an effluent limitation guideline to which the facility is subject must be monitored annually throughout the life of the permit. Permittees must also estimate flows. These monitoring requirements are summarized in Table AA-7.

Visual inspections of all storm water discharges associated with industrial activity are required quarterly. These

visual inspections shall include observations for color, odor, turbidity, floating solids, foam, scum, and oil sheen. Examinations shall be conducted in each of the following periods for the purposes of inspecting storm water quality associated with storm water runoff and snow melt: December to February (storm water runoff or snow melt); March to May (storm water runoff); June to August (storm water runoff); and September to November (storm water runoff or snow melt).

Visual inspections must be made during daylight hours during precipitation events unless there is insufficient rainfall to produce a runoff event. Examinations are to be made within the first 30 minutes but not more than 60 minutes of flow. Reports of the inspection must be maintained onsite and include: the date, time, name of personnel conducting the inspection, visual quality of the storm water discharge, and any probable source of any observed storm water contamination. Based on the results, the pollution prevention plan must be modified to control sources.

TABLE AA-7.—MONITORING REQUIREMENTS

| Parameter | Unit | Frequency | Sample type |
|------------------------------------|---------------|--|-------------|
| Total flow | gallons | Annual | Estimate. |
| Total Suspended Solids (TSS) | mg/L | Annual (unless TSS is 50 mg/L; no monitoring if less than 50 mg/L) | Grab. |
| Zinc | mg/L | Annual | Do. |
| Iron | mg/L |do | Do. |
| Chromium | mg/L |do | Do. |
| Cadmium | mg/L |do | Do. |
| Lead | mg/L |do | Do. |
| Nickel | mg/L |do | Do. |

In addition, the permittee shall record the following:

- Date and duration (in hours) of the storm event(s) sampled.
- Rainfall measurements (in inches) of the storm event.
- Duration between storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event.
- Estimate the total flow (in gallons) of each discharge sampled.

AB. Storm Water Discharges Associated With Industrial Activity From Facilities That Manufacture Transportation Equipment, Industrial, or Commercial Machinery

On November 16, 1990 (55 FR 47990), EPA promulgated the regulatory definition of "storm water discharge associated with industrial activity." This definition includes point source discharges of storm water from eleven categories of facilities, including " * * * (xi) facilities classified as Standard Industrial Classification (SIC) codes * * * 35 (except SIC 357), 37 (except SIC 373), * * * ." Facilities eligible for coverage under this section of today's permit are commonly identified by the following SIC codes:

- Engines and Turbines (SIC Code 351).
- Farm and Garden Machinery and Equipment (SIC Code 352).
- Construction, Mining, and Materials Handling Machinery and Equipment (SIC Code 353).
- Metalworking Machinery and Equipment (SIC Code 354).
- Special Industry Machinery, Except Metalworking Machinery (SIC Code 355).
- General Industrial Machinery and Equipment (SIC Code 356).
- Refrigeration and Service Industry Machinery (SIC Code 358).
- Miscellaneous Industrial and Commercial Machinery and Equipment (SIC Code 359).

- Motor Vehicles and Motor Vehicle Equipment (SIC Code 371).
 - Aircraft and Parts (SIC Code 372).
 - Motorcycles, Bicycles, and Parts (SIC Code 375).
 - Guided Missiles and Space Vehicles and Parts (SIC Code 376).
 - Miscellaneous Transportation Equipment (SIC Code 379).
- This section establishes special conditions for storm water discharges associated with industrial activities at facilities which manufacture transportation equipment, industrial or commercial machinery. The SIC codes of these facilities are in category (xi) of the definition of storm water discharges associated with industrial activity. Storm water discharges from facilities in this category are only regulated where

precipitation and storm water runoff come into contact with areas associated with industrial activities, and significant materials. Significant materials include, but are not limited to, raw materials, waste products, fuels, finished products, intermediate products, by-products, and other materials associated with industrial activities.

When an industrial facility, described by the above eligibility provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

If monitoring and pollution prevention plan requirements of another industrial activity section of this permit apply to co-located industrial activities at an industrial facility, the eligibility provisions of that industrial activity section shall not preclude the operator of the industrial facility from complying with the applicable monitoring and pollution prevention plan requirements of that section.

1. Industry Profile

There are approximately 14,000 facilities which handle and process ferrous and nonferrous metals to manufacture transportation equipment, industrial or commercial machinery. These facilities vary in size, age, number of employees and the types of operations performed. The manufacturing processes for these facilities are similar, although the finished products may vary. The general manufacturing process is conducted indoors, and includes activities such as cutting, shaping, grinding, cleaning, coating, forming, and finishing. Specific processes are referred to as "unit operations," and there are approximately 45 unit operations utilized by facilities that manufacture transportation equipment, industrial, or commercial machinery. Since these operations occur predominately indoors, contamination of storm water discharges from the manufacturing process is unlikely. Unit operations

include the following: electroplating, electroless plating, anodizing, chemical conversion coating, etching and chemical milling, cleaning, machining, grinding, polishing, barrel finishing, burnishing, impact deformation, pressure deformation, shearing, heat treating, thermal cutting, welding, brazing, soldering, flame spraying, sand blasting, abrasive jet machining, electrical discharge machining, electrochemical machining, electron beam machining, laser beam machining, plasma arc machining, ultrasonic machining, sintering, laminating, hot dip coating, sputtering, vapor plating, thermal infusion, salt bath descaling, solvent degreasing, paint stripping, painting, electrostatic painting, electropainting, vacuum metalizing, assembly, calibration, testing, and mechanical plating.

Facilities which manufacture transportation equipment, industrial and commercial machinery will utilize many of the same unit operations listed above. Aside from the specific unit operations, other types of industrial activity are shared by facilities covered by this section. For example, the majority of these facilities have outdoor material handling and storage activities, and share the same types of raw, scrap, and waste materials.

The primary raw materials utilized by this industry group include ferrous and nonferrous metals, such as aluminum, copper, iron, steel and alloys of these metals; either in raw form or as intermediate products. These metals are typically received at loading/unloading docks and are taken to outdoor storage areas (e.g., stockpiles, holding bins) before manufacturing.

Besides metals, other raw materials are utilized in the manufacturing process. These materials include paints, solvents (e.g., paint thinners, degreasers), chemicals (e.g., acids, bases, liquid gases), fuels (e.g., gasoline and diesel fuel), lubricating and cutting oils, and plastics. These materials are typically stored in bins, tanks, and/or 55 gallon drums outdoors on wooden pallets or concrete pads. They are used during the unit operations to cool and lubricate the metals (oils), clean metal parts (solvents, acids, bases), and coat metal parts before shipment (plastics, paints). Intermediate products are also sometimes stored outdoors before shipment or further manufacturing. These products may have residues of oils, solvents and metal particles, which are potential sources of pollutants to storm water discharges. Similarly, scrap metal will have the same residues, and is almost always stored outdoors in bins

before being sold to scrap metal recyclers.

The manufacturing process produces several types of hazardous and nonhazardous wastes. Hazardous wastes including paint wastes, solvent wastes, and sludge wastes are generated in small quantities at the facilities within this industrial group. Paint wastes result from painting operations and consist of paints and paint thinners. Solvent wastes result from metal cutting, shaping, and cleaning operations. As the metals are manufactured into different parts and treated with various chemicals, the different assembly parts must be cleaned with solvents to remove any chemical residues and rinsed with water. The metal parts are subject to more cleaning with detergents to remove the solvents and chemical residues and rinsed again with water to remove the detergents. Sludge wastes are generated when wastewater discharges from painting, plating, finishing and parts cleaning operations are treated, and is generally shipped offsite for disposal. Hazardous wastes are stored in 55 gallon drums outdoors before shipment and may be exposed to storm water discharges.

Nonhazardous wastes from this industry group include glass, tires, used wooden pallets, used equipment and machinery, as well as plastics and rubber wastes. All of these waste materials are stored outdoors and have the potential to pollute storm water discharges. Storm water runoff from these materials could include solids, oils, solvents and other pollutants generated in the manufacturing process.

Air emissions from stacks and ventilation systems are potential areas for exposure of materials to storm water discharges. Facilities which have high levels of engine exhaust from the manufacturing equipment, paint residue, and particulates in fumes from metal processing activities such as cutting, grinding, shaping, and welding, are subject to having particulate in the air emissions that may pollute storm water discharges.

Material handling activities such as loading and unloading areas may be exposed to storm water discharges. These are areas where significant materials are received and shipped at the facilities. Exposure of these materials to storm water may be minimized by having shipping/receiving areas under cover.

For those facilities engaged in fueling and vehicle maintenance, gasoline and diesel fuel are frequently stored outdoors in aboveground storage tanks and 55 gallon drums. Most vehicles and equipment also require oil, hydraulic

fluids, antifreeze, and other fluids that may leak and contaminate storm water discharges. The discharges from these areas are addressed elsewhere in today's proposed permit.

2. Pollutants Found in Storm Water Discharges From Facilities Which Manufacture Transportation Equipment, Industrial or Commercial Machinery

The impact of industrial activities at facilities which manufacture transportation equipment, industrial or commercial machinery on storm water discharges will vary. Factors at a site which influence the water quality

include geographic location, hydrogeology, the industrial activities exposed to storm water discharges, the facility's size, the types of pollution prevention measures/best management practices in place, and the type, duration, and intensity of storm events. Taken together or separately, these factors determine how polluted the storm water discharges will be at a given facility. For example, scrap piles may be a significant source of pollutants at some facilities, while particulate stack emissions may be the primary pollutant source at others. Additionally, pollutant sources other than storm water, such as

illicit connections, spills, and other improperly dumped materials, may increase the pollutant loading discharged into Waters of the United States.

Table AB-1 lists industrial activities that commonly occur at transportation equipment, industrial or commercial machinery manufacturers, the pollutant sources at these facilities, and pollutants that are associated with these activities. Table AB-1 identifies oil and grease, TSS, organics, and other parameters as potential pollutants of concern associated with facilities covered by this section.

TABLE AB-1.—DESCRIPTION OF INDUSTRIAL ACTIVITIES, POTENTIAL POLLUTANT SOURCES, AND POSSIBLE POLLUTANTS

| Activity | Pollutant source | Pollutants |
|---|---|---|
| Outdoor Material Loading/Unloading . | Wooden pallets, castings, foundry sand, limestone, spills/leaks from material handling equipment, solvents. | TSS, turbidity, dust, oil and grease, organics. |
| Outdoor Material and Equipment Storage. | Foundry sand, limestone, used equipment, above ground tanks, scrap metal, oil and grease, raw materials (e.g., aluminum, steel, iron, copper), castings, solvents, acids, and paints. | TSS, turbidity, dust, oil and grease, heavy metals, and organics. |

Source: NPDES Storm Water Group Applications—Part 1. Received by EPA, March 18, 1991 through December 31, 1992.

Part 2 group application data that was statistically summarized indicated large variations in the minimum and maximum values reported for each of the eight conventional pollutants monitored:

- Oil and grease samples ranged from 0 mg/L to 233 mg/L.
- Grab sample values for Total Suspended Solids (TSS) ranged from 0 mg/L to 6,453 mg/L, and flow-weighted composite sample values ranged from 0 mg/L to 3,600 mg/L.
- Grab samples for Chemical Oxygen Demand (COD) ranged from 0 mg/L to 940 mg/L.

The remaining conventional pollutants sampled also varied in their minimum and maximum values. However, the values were typically low relative to other sectors in today's proposed permit. As discussed in greater detail in the monitoring section of this section, part 2 data indicates that the high levels of pollutants at some facilities are atypical to those experienced by the majority of facilities which manufacture transportation equipment, industrial or commercial machinery. Table AB-2 indicates the sampling results for the conventional pollutants that were statistically analyzed by EPA. This table indicates

the minimum and maximum values, means, medians, 95th percentiles, 99th percentiles, and the total number of samples analyzed for each of the conventional pollutants. Part 2 data which has not been statistically summarized is generally consistent with the values reported in Table AB-2.

Group applicants were only required to sample for metals if the facility knew or had reason to believe they would be present in the discharge. Part 2 data indicated that facilities which sampled for metals generally reported low values compared to the most stringent storm water effluent guideline limitations.

TABLE AB-2.—STATISTICS FOR CONVENTIONAL POLLUTANTS IN STORM WATER:
[mg/L, except as noted]

| Pollutant Sample Type | # of Samples | | Mean | | Minimum | | Maximum | | Median | | 95th Percentile | | 99th Percentile | |
|--------------------------------|--------------|--------------------|------|------|---------|------|---------|-------|--------|-------|-----------------|-------|-----------------|-------|
| | Grab | Comp ¹¹ | Grab | Comp | Grab | Comp | Grab | Comp | Grab | Comp | Grab | Comp | Grab | Comp |
| BOD ⁵ | 182 | 179 | 13.0 | 7.3 | 0.0 | 0.0 | 513.0 | 226.0 | 6.0 | 5.0 | 32.0 | 19.0 | 194.0 | 76.0 |
| COD | 174 | 169 | 66.9 | 46.6 | 0.0 | 0.0 | 940.0 | 610.0 | 36.0 | 29.0 | 310.0 | 149.2 | 570.0 | 334.0 |
| Nitrate+Nitrite Nitrogen | 184 | 174 | 1.20 | 1.28 | 0.0 | 0.0 | 19.2 | 28.0 | 0.575 | 0.450 | 5.0 | 4.5 | 8.80 | 25.6 |
| Total Kjeldahl Nitrogen | 170 | 165 | 2.47 | 1.81 | 0.00 | 0.0 | 55.0 | 30.0 | 1.3 | 1.1 | 5.8 | 4.75 | 41.0 | 20.0 |
| Oil and Grease | 189 | N/A | 7.8 | N/A | 0.0 | N/A | 223.0 | N/A | 0.0 | N/A | 34.0 | N/A | 190.0 | N/A |
| pH (s.u.) | 179 | N/A | N/A | N/A | 4.1 | N/A | 9.1 | N/A | N/A | N/A | N/A | N/A | N/A | N/A |
| Total Phosphorus | 176 | 172 | 0.29 | 0.4 | 0.0 | 0.0 | 4.3 | 13.0 | 0.14 | 0.13 | 1.0 | 1.12 | 2.8 | 11.5 |
| Tot. Suspended Solids | 173 | 169 | 163 | 100 | 0 | 0 | 6453 | 3600 | 30 | 17 | 576 | 319 | 3700 | 1868 |

¹Applicants that did not report the units of measurement for the reported values of pollutants were not included in these statistics.¹¹Composite samples.

Chemical Oxygen Demand (COD), pH, Oil and grease, and Total Suspended Solids (TSS) are conventional pollutants commonly associated with the industrial activities and materials used onsite at these manufacturing facilities. The data included in part 2 of the application indicate that the potential for discharges to contain significant levels of pollutants does not justify analytical analysis of storm water discharges under this permit from transportation equipment, industrial and commercial machinery manufacturers.

- **Chemical Oxygen Demand (COD)**—COD measures the total amount of oxygen necessary for oxidation. COD is an effective indicator of levels of biologically resistant organic substances. Higher COD levels, for example, may be attributed to the presence of biologically resistant organics, such as oil and grease. The statistically summarized part 2 data indicated the following results concerning COD at facilities which manufacture transportation equipment, industrial, or commercial machinery:

- Approximately 6 percent of the sampling facilities reported COD higher than 150 mg/L.
- The mean concentrations for grabs and composites were approximately 66.9 mg/L and 46.6 mg/L, respectively.
- The median concentrations for grabs and composites were approximately 36 mg/L and 29 mg/L, respectively.
- The 95th percentile concentration (i.e., 95 percent of the values are below) for grabs and composites were approximately 310 mg/L and 149.2 mg/L, respectively.
- The 99th percentile concentration (i.e., 99 percent of the values are below) for grabs and composite were 570 mg/L and 334 mg/L, respectively.

A review of additional part 2 data also revealed COD levels frequently below the most stringent storm water effluent guideline limitations. Therefore, EPA does not believe it is necessary to impose monitoring of COD.

- **Oil and Grease**—There are several sources of oil and grease from transportation equipment, industrial or commercial machinery manufacturing facilities. These sources include unloading/loading areas; vehicle/equipment maintenance and cleaning; and outdoor storage of vehicles, equipment and castings. Oil and grease emulsions are detrimental to aquatic organisms and inhabitants because: (1) deposition of oil and grease in bottom sediments can serve to inhibit normal benthic growths, impacting the aquatic food chain; (2) oil and grease emulsion

may destroy algae or other plankton; (3) oil and grease emulsions may adhere to the gills of fish exerting a toxic effect to fish; and (4) water insoluble components damage the plumage and coats of aquatic animals and fowls. Floating oil may reduce the re-aeration of the water surface, and in conjunction with emulsified oil, may interfere with photosynthesis. In addition to environmental impacts, oil and grease impact the aesthetic qualities of water by forming unsightly surface slicks that affect water beaches and shorelines.

Part 2 oil and grease data that was statistically summarized for facilities which manufacture transportation equipment, industrial or commercial machinery indicate the following:

- The mean concentration was 7.5 mg/L.
- The 95th percentile concentration (i.e., 95 percent of the values are below) was 34 mg/L.
- The 99th percentile concentration (i.e., 99 percent of the values are below) was 190 mg/L.

The most stringent storm water effluent guidelines establish a limit of 15 mg/L of oil and grease in a discharge.¹³⁰ The statistically summarized part 2 data indicates that the mean and median concentration of oil and grease are below this limit and, therefore, EPA does not believe it is necessary to impose continued monitoring for oil and grease. Further supporting EPA's belief that oil and grease are not a pollutant of concern, a review of additional part 2 data revealed oil and grease values typically below the 15 mg/L limit established by the most stringent storm water effluent guideline limitations.

- **pH**—pH is a measure of the acidity or alkalinity of a discharge. On the pH scale ranging from zero to fourteen, a value of seven represents neutral conditions in which the concentrations of hydrogen and hydroxyl ions are equal. Values of pH less than seven represent acidic conditions; values greater than seven represent basic conditions.

The pH level is easily measured and is an indication of potential environmental impacts. Storm water discharges with pH values markedly different from the pH values of the receiving stream are potentially detrimental to the environment. At outfalls and prior to complete mixing of storm water discharges with receiving waters, a zone of sudden pH change can damage or kill biota engulfed in the zone of change.

Statistically summarized part 2 data indicate that approximately 5 percent of the sampling facilities reported a pH below 6.

The part 2 data indicates that pH concentration levels are inside the permitted range for wastewater discharges under effluent limitation guidelines. Additional part 2 data revealed a high frequency of pH values within the permitted range of wastewater discharges. Therefore, EPA does not believe monitoring for pH is justified.

- **Total Suspended Solids (TSS)**—TSS is associated with facilities which manufacture transportation equipment, industrial or commercial machinery because their sites are sparsely vegetated, and have a low percentage of impervious land areas and, therefore, are unstabilized. TSS in storm water discharges from these types of manufacturing facilities primarily consists of inorganic materials such as sand, silt, and limestone. Because suspended solids increase the turbidity of water, less light is able to penetrate the water, reducing photosynthetic activity of aquatic vegetation. Over time, total suspended solids settle out to form deposits that can be detrimental to stream environments. These deposits may destroy fauna that breed and grow in or near the bottoms of streams and serve as food for fish and other aquatic life. The deposits can also blanket and destroy spawning grounds for fish. The statistically summarized part 2 data indicated the following results concerning TSS from facilities which manufacture transportation equipment, industrial or commercial machinery:

- Approximately 5 percent of the sampling facilities reported TSS levels above 548 mg/L.
- The mean concentrations for grabs and composites were approximately 163 mg/L and 100 mg/L, respectively.
- The median concentrations for grabs and composites were approximately 30 mg/L and 17 mg/L, respectively.
- The 95th percentile concentration (i.e., 95 percent of the values are below) for grabs and composites were approximately 576 and 319, respectively.
- The 99th percentile concentration (i.e., 99 percent of the values are below) for grabs and composite were 3,700 mg/L and 1,868 mg/L, respectively.

A review of additional part 2 data showed TSS values generally below the 168 mg/L grab sample mean concentration. Therefore, data submitted in part 2 applications does not support continued monitoring of TSS.

¹³⁰ Per 40 CFR part 419.

• **Heavy Metals**—EPA is not proposing to require monitoring of metals by facilities covered under this section of today's proposed permit. As required by 40 CFR 122.26 (g)(ii) and (iii), group applicants were only required to sample for metals if the facility knew or had reason to believe they would be expected in the discharge. Of the part 2 data which was statistically summarized, less than 10 percent of the facilities submitting data reported on heavy metals.

EPA considers the high levels of heavy metals reported by certain facilities to be atypical of those experienced by the majority of facilities which manufacture transportation equipment, industrial or commercial machinery. Part 2 data indicated that facilities sampling for heavy metals typically reported concentrations below the most stringent storm water effluent guideline limitations. Therefore, EPA does not believe it is necessary to impose monitoring for heavy metals.

3. Options for Controlling Pollutants

In evaluating options for controlling pollutants in storm water discharges, EPA must achieve compliance with the technology-based standards of the Clean Water Act (Best Available Technology (BAT) and Best Conventional Technology)). The Agency does not believe that it is appropriate to establish specific numeric effluent limitations or a specific design or performance standard in this section for storm water discharges associated with industrial activity from facilities which

manufacture transportation equipment, industrial or commercial machinery to meet BAT/BCT standards of the Clean Water Act. Instead, this section establishes requirements for the development and implementation of site-specific storm water pollution prevention plans consisting of a set of Best Management Practices (BMPs) that are sufficiently flexible to address different sources of pollutants at different sites.

Certain BMPs are implemented to prevent and/or minimize exposure of pollutants from industrial activities to storm water discharges. EPA believes the most effective BMPs for reducing pollutants in storm water discharges are exposure minimization practices. Exposure minimization practices lessen the potential for storm water to come into contact with pollutants. Good housekeeping practices ensure that facilities are sensitive to routine and nonroutine activities which may increase pollutants in storm water discharges. The BMPs which address good housekeeping and exposure minimization are easily implemented, inexpensive, and require little, if any, maintenance. BMP expenses may include construction of roofs for storage areas or other forms of permanent cover and the installation of berms/dikes. Other BMPs such as detention/retention ponds and filtering devices may be needed at these facilities because of the contaminant level in the storm water discharges. The types of BMPs implemented will depend on the type of

discharge, types and concentrations of contaminants, and the volume of the flow.

The selection of the most effective BMPs will be based on site-specific considerations such as: facility size, climate, geographic location, geology/hydrology and the environmental setting of each facility, and volume and type of discharge generated. Each facility will be unique in that the source, type, and volume of contaminated storm water discharges will differ. In addition, the fate and transport of pollutants in these discharges will vary. EPA believes that the management practices discussed herein are well suited mechanisms to prevent or control the contamination of storm water discharges associated with transportation equipment, industrial or commercial machinery manufacturers.

Part 1 group application data indicate that BMPs have not been widely implemented at the representative sampling facilities. Less than 25 percent of the sampling subgroup reported that they store some materials indoors; less than 10 percent cover loading areas, dumpsters, drums, or above ground tanks; less than 5 percent of the representative facilities utilize waste minimization practices (e.g., recycling or reusing materials).¹³¹ Because BMPs described in part 1 data are limited, the following table is provided to identify BMPs associated with activities that routinely occur at facilities which manufacture transportation equipment, industrial or commercial machinery.

TABLE AB-3.—GENERAL STORM WATER BMPs FOR FACILITIES WHICH MANUFACTURE TRANSPORTATION EQUIPMENT, INDUSTRIAL, OR COMMERCIAL MACHINERY

| Activity | Best management practices (BMPs) |
|--|---|
| Outdoor unloading and loading | Confine loading/unloading activities to a designated area. Consider performing loading/unloading activities indoors or in a covered area. Consider covering loading/unloading area with permanent cover (e.g., roofs) or temporary cover (e.g., tarps). Close storm drains during loading/unloading activities in surrounding areas. Avoid loading/unloading materials in the rain. Inspect the unloading/loading areas to detect problems before they occur. Inspect all containers prior to loading/unloading of any raw or spent materials. Consider berming, curbing, or diking loading/unloading areas. Use dry clean-up methods instead of washing the areas down. Train employees on proper loading/unloading techniques. |
| Outdoor material storage (including waste, and particulate emission management). | Confine storage of materials, parts, and equipment to designated areas. Consider curbing, berming, or diking all liquid storage areas. Train employees on proper waste control and disposal. Consider covering tanks. Ensure that all containers are closed (e.g., valves shut, lids sealed, caps closed). Wash and rinse containers indoors before storing them outdoors. If outside or in covered areas, minimize runoff of storm water by grading the land to divert flow away from containers. Inventory all raw and spent materials. Clean around vents and stacks. |

¹³¹ These percentages were based on the information reported in the Part 1 group applications. However, some facilities which utilize

these BMPs as part of their daily activities may not recognize these practices as BMPs and as a result did not report this information in their applications.

TABLE AB-3.—GENERAL STORM WATER BMPs FOR FACILITIES WHICH MANUFACTURE TRANSPORTATION EQUIPMENT, INDUSTRIAL, OR COMMERCIAL MACHINERY—Continued

| Activity | Best management practices (BMPs) |
|----------|---|
| | Place tubs around vents and stacks to collect particulate. Inspect air emission control systems (e.g., baghouses) regularly, and repair or replace when necessary. Store wastes in covered, leak proof containers (e.g., dumpsters, drums). Consider shipping all wastes to offsite landfills or treatment facilities. Ensure hazardous waste disposal practices are performed in accordance with Federal, State, and local requirements. |

4. Special Conditions

There are no additional requirements under this section other than those stated in the general fact sheet language.

5. Storm Water Pollution Prevention Plan Requirements

EPA believes that pollution prevention is the most effective approach for controlling contaminated storm water discharges from facilities which manufacture transportation equipment, industrial or commercial machinery. The requirements included in the pollution prevention plans provide a flexible framework for the development and implementation of site-specific controls to minimize the pollutants in storm water discharges. This flexibility is necessary because each facility is unique in that the source, type, and volume of contaminated storm water discharge will vary from site to site.

Under today's proposed permit, all facilities must prepare and implement a storm water pollution prevention plan. The pollution prevention plan requirement reflects EPA's decision to allow operators of transportation equipment, industrial or commercial machinery manufacturing facilities to utilize BMPs as the BAT/BCT level of control for the storm water discharges covered by this section. The pollution prevention plan requirements in this section are consistent with EPA's storm water general permits finalized on September 9, 1992 (57 FR 41236), and September 25, 1992 (57 FR 44438), for discharges in nonauthorized NPDES States.

There are two major objectives to a pollution prevention plan: (1) To identify sources of pollution potentially affecting the quality of storm water discharges associated with industrial activity from a facility; and (2) to describe and ensure implementation of practices to minimize and control pollutants in storm water discharges

associated with industrial activity from a facility.

Specific requirements for a pollution prevention plan for transportation equipment, industrial or commercial machinery manufacturing facilities are described below. These requirements must be implemented in addition to the baseline pollution prevention plan provisions discussed previously.

a. Contents of the plan. Storm water pollution prevention plans are intended to aid operators of transportation equipment, industrial or commercial machinery manufacturing facilities to evaluate all potential prevention sources at a site, and assist in the selection and implementation of appropriate measures designed to prevent, or control, the discharge of pollutants in storm water runoff. EPA has developed guidance entitled "Storm Water Management for Industrial Activities: Developing Pollution Prevention Plans and Best Management Practices," EPA, 1992, (EPA 832-R-92-006) to assist permittees in developing and implementing pollution prevention measures.

(1) Description of potential pollutant sources. Each storm water pollution prevention plan must describe activities, materials, and physical features of the facility that may contribute pollutants to storm water runoff or, during periods of dry weather, result in dry weather flows. This assessment of potential storm water pollutant source will support subsequent efforts to identify and set priorities for necessary changes in materials, materials management practices, or site features, as well as aid in the selection of appropriate structural and nonstructural control techniques. Plans must describe the following elements:

(a) Site map.—The plan must contain a map of the site that shows the pattern of storm water drainage, structural and nonstructural features that control pollutants in storm water runoff and process wastewater discharges, surface

water bodies (including wetlands), places where significant materials¹³² are exposed to rainfall and runoff, and locations of major spills and leaks that occurred in the 3 years prior to the effective date of this permit. The map must also indicate the direction of storm water flow. An outline of the drainage area for each outfall must be provided; and the location of each outfall and monitoring points must be indicated. An estimation of the total site acreage utilized for each industrial activity (e.g., storage of raw materials, waste materials, and used equipment) must be provided. These areas include liquid storage tanks, stockpiles, holding bins, used equipment, and empty drum storage. These areas are considered to be significant potential sources of pollutants at facilities which manufacture transportation equipment, industrial or commercial machinery.

(b) Inventory of exposed materials.—Facility operators are required to carefully conduct an inspection of the site to identify significant materials that are or may be exposed to storm water discharges. The inventory must address materials that within 3 years prior to the effective date of this permit have been handled, stored, processed, treated, or disposed of in a manner to allow exposure to storm water. Findings of the inventory must be documented in detail in the pollution prevention plan. At a minimum, the plan must describe the method and location of onsite storage or

¹³² Significant materials include, " * * * but [are] not limited to: Raw materials, fuels, materials such as solvents, detergents, and plastic pellets; finished materials such as metallic products; . . . hazardous substances designated under section 101(14) of CERCLA; any chemical facilities are required to report pursuant to section 313 of Title III of SARA; fertilizers; pesticides; and waste products such as ashes, slag, and sludge that have the potential to be released with storm water discharge." (40 CFR 122.26(b)(12)). Significant materials commonly found at transportation equipment, industrial or commercial machinery manufacturing facilities include raw and scrap metals; solvents; used equipment; petroleum based products; waste materials or by-products used or created by the facility.

disposal; practices used to minimize contact of materials with precipitation and runoff; existing structural and nonstructural controls that reduce pollutants in storm water; existing structural controls that limit process wastewater discharges; and any treatment the runoff receives before it is discharged to surface waters or through a separate storm sewer system. The description must be updated whenever there is a significant change in the type or amounts of materials, or material management practices, that may affect the exposure of materials to storm water.

(c) *Significant spills and leaks*—The plan must include a list of any significant spills and leaks of toxic or hazardous pollutants that occurred in the 3 years prior to the effective date of the permit. Significant spills include, but are not limited to, releases of oil or hazardous substances in excess of reportable quantities under Section 311 of CWA (see 40 CFR Section 110.10 and Section 117.21) or Section 102 of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) (see 40 CFR Section 302.4). Significant spills may also include releases of oil or hazardous substances that are not in excess of reporting requirements and releases of materials that are not classified as oil or a hazardous substance.

(d) *Non-storm water discharges*—Each pollution plan must include a certification, signed by an authorized individual, that discharges from the site have been tested or evaluated for the presence of non-storm water, the results of any test and/or evaluation conducted to detect such discharges, the test method or evaluation criteria used, the dates on which tests or evaluations were performed, and the onsite drainage points directly observed during the test or evaluation. Pollution prevention plans must identify and ensure the implementation of appropriate pollution prevention measures for any non-storm water discharges.

(e) *Sampling data*—Any existing data describing the quality or quantity of storm water discharges from the facility must be summarized in the plan. The description should include a discussion of the methods used to collect and analyze the data. Sample collection points should be identified in the plan and shown on the site map.

(f) *Summary of potential pollutant sources*—The description of potential pollutant sources should clearly point to activities, materials, and physical features of the facility that have a reasonable potential to contribute significant amounts of pollutants to

storm water. Any such activities, materials, or features must be addressed by the measures and controls subsequently described in the plan. In conducting the assessment, the facility operator must consider the following activities: raw materials (liquid storage tanks, stockpiles, holding bins), waste materials (empty drum storage), and used equipment storage areas. The assessment must list any significant pollutant parameter(s) (i.e., total suspended solids, oil and grease, etc.) associated with each source.

(2) *Measures and controls*. Permittees must select, describe, and evaluate the pollution prevention measures, BMPs, and other controls that will be implemented at the facility. Source reduction measures include preventive maintenance, spill prevention, good housekeeping, training, and proper materials management. If source reduction is not an option, EPA supports the use of source control measures. These include BMPs such as material covering, water diversion, and dust control. If source reduction or source control are not available, then recycling or waste treatment are other alternatives. Recycling allows the reuse of storm water, while treatment lowers pollutant concentrations prior to discharge. Since the majority of transportation equipment, industrial or commercial machinery manufacturing occurs indoors, the BMPs identified above are geared towards only those activities occurring outdoors or otherwise have a potential to contribute pollutants to storm water discharges.

Pollution prevention plans must discuss the reasons each selected control or practice is appropriate for the facility and how each of the potential pollutant sources will be addressed. Plans must identify the time during which controls or practices will be implemented, as well the effect the controls or practices will have on storm water discharges from the site. At a minimum, the measures and controls must address the following components:

(a) *Good housekeeping*—Permittees must describe protocols established to reduce the possibility of mishandling chemicals or equipment and training employees in good housekeeping techniques. Specifics of this plan must be communicated to appropriate plant personnel.

(b) *Preventive maintenance*—Permittees are required to develop a preventive maintenance program that includes regular inspections and maintenance of storm water BMPs. Inspections should assess the effectiveness of the storm water pollution prevention plan. They allow

facility personnel to monitor the components of the plan on a regular basis. The use of a checklist is encouraged, as it will ensure that all of the appropriate areas are inspected and provide documentation for recordkeeping purposes.

(c) *Spill prevention and response procedures*—Permittees are required to identify proper material handling procedures, storage requirements, containment or diversion equipment, and spill removal procedures to reduce exposure of spills to storm water discharges. Areas and activities which are high risks for spills at transportation equipment, industrial or commercial machinery manufacturing facilities include raw material unloading and product loading areas, material storage areas, and waste management areas. These activities and areas and their drainage points must be described in the plan.

(d) *Inspections*—Qualified personnel must inspect designated equipment and areas of the facility at the proper intervals specified in the plan. The plan should identify areas which have the potential to pollute storm water for periodic inspections. Records of inspections must be maintained onsite.

(e) *Employee training*—Permittees must describe a program for informing and educating personnel at all levels of responsibility of the components and goals of the storm water pollution prevention plan. A schedule for conducting this training should be provided in the plan. Where appropriate, contractor personnel must also be trained in relevant aspects of storm water pollution prevention. Topics for employee training should include good housekeeping, materials management, and spill response procedures.

(f) *Recordkeeping and internal reporting procedures*—Permittees must describe procedures for developing and retaining records on the status and effectiveness of plan implementation. This includes the success and failure of BMPs implemented at the facility.

(g) *Sediment and erosion control*—Permittees must identify areas, due to topography, activities, soils, cover materials, or other factors that have a high potential for soil erosion. Measures to eliminate erosion must be identified in the plan.

(h) *Management of runoff*—Permittees must provide an assessment of traditional storm water management practices that divert, infiltrate, reuse, or otherwise manage storm water so as to reduce the discharge of pollutants. Based on this assessment, practices to control runoff from these areas must be

identified and implemented as required by the plan.

(3) *Comprehensive site compliance evaluation.* The storm water pollution prevention plan must describe the scope and content of comprehensive site inspections that qualified personnel will conduct to: (1) confirm the accuracy of the description of potential sources contained in the plan, (2) determine the effectiveness of the plan, and (3) assess compliance with the terms and conditions of this section. Comprehensive site compliance evaluations must be conducted once a year for transportation equipment, industrial or commercial machinery manufacturing facilities. The individual(s) who will conduct the inspections must be identified in the plan and should be members of the pollution prevention team. Inspection reports must be retained for at least 3 years after the date that the permit expires.

Based on the results of each inspection, the description of potential pollution sources, and measures and controls, the plan must be revised as appropriate within 2 weeks after each inspection. Changes in the measures and controls must be implemented on the site in a timely manner, never more than 12 weeks after completion of the inspection.

6. Numeric Effluent Limitation

There are no additional requirements under this section other than those stated in the general fact sheet language.

7. Monitoring and Reporting Requirements

a. Monitoring requirements. The regulatory modifications at 40 CFR-122.44 (i)(2) established on April 2, 1992, grant permit writers the flexibility to reduce monitoring requirements in storm water discharge permits. EPA has determined that the potential for storm water discharges to contain pollutants above benchmark levels, because of the industrial activities and materials exposed to precipitation, does not support sampling at facilities that manufacture transportation equipment, industrial, or commercial machinery. Based on a consideration of the BMPs typically used at these facilities, and generally low pollutant values from the application data, EPA believes that the pollution prevention plan with visual observations of storm water discharges will help to ensure storm water contamination is minimized. Because permittees are not required to conduct sampling, they will be able to focus their resources on developing and

implementing the pollution prevention plan.

Quarterly visual inspections of a storm water discharge from each outfall are required at transportation equipment, industrial, or commercial machinery manufacturing facilities. The inspection must be of a grab sample collected from each storm water outfall. The examination of storm water grab samples shall include any observations of color, odor, turbidity, floating solids, foam, oil sheen, or other obvious indicators of storm water pollution. The inspections must be conducted in a well lit area. No analytical tests are required to be performed on these samples.

The examination must be made at least once in each designated period during daylight hours unless there is insufficient rainfall or snow-melt to runoff. EPA expects that, whenever practicable, the same individual should carry out the collection and examination of discharges throughout the life of the permit to ensure the greatest degree of consistency possible. Examinations shall be conducted in each of the following periods for the purposes of inspecting storm water quality associated with storm water runoff and snow melt: December to February; March to May; June to August; September to November. Grab samples shall be collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 60 minutes) of when the runoff begins discharging. Reports of the visual observation include: the examination date and time, examination personnel, visual quality of the storm water discharge, and probable sources of any observed storm water contamination. The visual observation reports must be maintained onsite with the pollution prevention plan.

EPA believes that this quick and simple assessment will help the permittee to determine the effectiveness of his/her plan on a regular basis at very little cost. Although the visual examination cannot assess the chemical properties of the storm water discharged from the site, the examination will provide meaningful results upon which the facility may act quickly. The frequency of this visual inspection will also allow for timely adjustments to be made to the plan. If BMPs are performing ineffectively, corrective action must be implemented. A set of tracking or follow-up procedures must be used to ensure that appropriate actions are taken in response to the inspections. The visual examination is intended to be performed by members of the pollution prevention team. This hands-on inspection will enhance the staff's understanding of the storm water

problems on that site and the effects of the management practices that are included in the plan.

When a discharger is unable to collect samples over the course of the monitoring period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

As discussed above, EPA does not believe that chemical monitoring is necessary for facilities that manufacture transportation equipment, industrial, or commercial machinery. EPA believes that between quarterly visual inspections and site compliance evaluations potential sources of contaminants can be recognized, addressed, and then controlled with BMPs. In determining the monitoring requirements, EPA considered the nature of the industrial activities and significant materials exposed at these sites, and performed a review of data provided in Part 2 group applications.

8. Cost Estimates

There are no additional requirements under this section other than those stated in the general fact sheet language.

AC. Storm Water Discharges Associated With Industrial Activity From Facilities That Manufacture Electronic and Electrical Equipment and Components, Photographic and Optical Goods

1. Discharges Covered Under This Section

This sector covers storm water discharges associated with industrial activity from facilities in major Standard Industrial Classification (SIC) groups 36 and 38, and industrial group 357.

Major SIC group 36 includes manufacturers of a broad range of electronic and electrical equipment and components, not including computer equipment. Specifically, this group includes manufacturers of electricity distribution equipment such as transformers and switch-gear, electrical industrial equipment such as motors and generators, household appliances, electric lighting and wiring equipment such as light bulbs and lighting fixtures, and audio and video equipment including phonograph records and audio tapes and disks. Also included are manufacturers of communication

equipment including telephone and telegraph equipment, radio and television equipment, electronic components such as printed circuit boards and semiconductors and related devices, and miscellaneous electrical items such as batteries and electrical equipment for automobiles.

Major SIC group 38 includes manufacturers of measuring, analyzing, and controlling instruments, photographic, medical and optical goods, and watches and clocks. Specifically, this group includes facilities which manufacture search, detection, navigation, or guidance systems such as radar and sonar equipment, measurement and control instruments and laboratory apparatus, surgical, medical and dental instruments and supplies, photographic equipment and supplies, and watches and clocks.

Computer and office equipment is included in industrial SIC group 357. This group includes manufacturers of computers, computer storage devices, and peripheral equipment for computers such as printers and plotters. Manufacturers of miscellaneous office machines are also included in this group.

The SIC codes of the facilities covered by this section are in category (xi) of the definition of storm water discharges associated with industrial activity. Storm water discharges from facilities in this category are only regulated where precipitation and storm water runoff come into contact with areas associated with industrial activities, and significant materials. Significant materials include, but are not limited to, raw materials, waste products, fuels, finished products, intermediate products, by-products, and other materials associated with industrial activities.

When an industrial facility, described by the above eligibility provisions of this section, has industrial activities

being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

If monitoring and pollution prevention plan requirements of another industrial activity section of this permit apply to co-located industrial activities at an industrial facility, the eligibility provisions of that industrial activity section shall not preclude the operator of the industrial facility from complying with the applicable monitoring and pollution prevention plan requirements of that section.

2. Pollutants Found in Storm Water Discharges

a. Sources of pollutants. As discussed above, the SICs of the facilities in this sector fall into category (xi) of the definition of "storm water associated with industrial activity" found at 40 Code of Federal Regulations (CFR) 122.26(b)(14). As noted in the preamble to the final storm water regulations of November 16, 1990, most of the actual manufacturing and processing activity at these types of facilities normally occurs indoors (55 FR 48008).

Additional information concerning these manufacturing processes and the industrial sector itself can be found in the following documents:

- "Development Document for Effluent Limitations Guidelines and Standards for the Electrical and

Electronics Components Point Source Category, Phase I," EPA 440/1-83/075.

- "Development Document for Effluent Limitations Guidelines and Standards for the Electrical and Electronic Components Point Source Category, Phase II," EPA 440/1-84/075.

- "Development Document for Existing Source Pretreatment Standards for the Electroplating Point Source Category," EPA 440/1-79/003.

- "Development Document for Effluent Limitations Guidelines and Standards for the Metal Finishing Point Source Category," EPA 440/1-83/091.

The types of activities at these facilities where exposure to storm water may occur consist primarily of loading/unloading activities, and the storage and handling of raw materials, by-products, final products or waste products. A wide variety of materials are used at these facilities including metals, acids used for chemical etching, alkaline solutions, solvents, various oils and fuels and miscellaneous chemicals. Tanks or drums of these materials may be exposed to storm water during loading/unloading operations, or through outdoor storage or handling at some facilities.

Liquid wastes which may be exposed at least temporarily include spent solvents and acids, miscellaneous chemicals and oily wastes. These wastes may be contaminated with a variety of heavy metals and chlorinated hydrocarbons. Used equipment, scrap metal and wire, soiled rags and sanding materials may also be exposed to storm water and constitute a potential source of pollutants. In addition, some facilities reported that dumpsters containing non-hazardous wastes or manufacturing debris may be exposed to storm water.

Table AC-1 lists potential pollutant sources from activities that commonly take place at facilities which manufacture electronic and electrical equipment and components, photographic and optical goods.

TABLE AC-1.—COMMON POLLUTANT SOURCES

| Activity | Pollutant source | Pollutants |
|---|---|--|
| Outdoor Material Loading/Unloading | Wooden pallets, spills/leaks from material handling equipment, raw materials, finished products, solvents. | TSS, oil and grease, organics. |
| Outdoor Material and Equipment Storage. | Sulfuric acid, alkaline solutions, solvents, miscellaneous chemicals, oily wastes, lead, silver, copper, zinc, spent solvents and acids, scrap metal and wire, oily rags. | Organics, oil and grease, acids, alkalinity, heavy metals. |

b. Storm water sampling results. Tables AC-2 and AC-3 summarize the storm water monitoring results for the basic parameters which were reported

by facilities in this sector. Table AC-2 provides composite sample data and Table AC-3 provides the grab sample results.

TABLE AC-2.—COMPOSITE SAMPLE RESULTS

| Pollutant | Units | Number of Samples | Mean | Min | Max | Median | 95th Perc. | 99th Perc. |
|--|----------|-------------------|-------|------|-------|--------|------------|------------|
| BOD ₅ | mg/L | 64 | 8.81 | 1.0 | 139.0 | 5.5 | 14.0 | 54.0 |
| COD | mg/L | 65 | 59.18 | 4.0 | 220.0 | 46.0 | 200.0 | 450.0 |
| NO ₃ + NO ₂ nitrogen | mg/L | 64 | 0.83 | 0.16 | 2.54 | 0.512 | 1.43 | 6.97 |
| Total Kjeldahl nitrogen | mg/L | 62 | 1.46 | 0.06 | 13.6 | 1.050 | 3.70 | 10.20 |
| Oil and grease | mg/L | N/A | N/A | N/A | N/A | N/A | N/A | N/A |
| pH | s.u. ... | 69 | N/A | 5.5 | 8.3 | N/A | N/A | N/A |
| Total phosphorus | mg/L | 64 | 7.43 | 0.01 | 44.4 | 0.132 | 1.2 | 80.10 |
| TSS | mg/L | 63 | 89.21 | 1.0 | 716.0 | 29.0 | 370.0 | 610.0 |

TABLE AC-3.—GRAB SAMPLE RESULTS

| Pollutant | Units | Number of samples | Mean | Min | Max | Median | 95th Perc. | 99th Perc. |
|--|----------|-------------------|-------|------|-------|--------|------------|------------|
| BOD ₅ | mg/L | 64 | 8.81 | 0.0 | 54.0 | 5.50 | 32.0 | 54.0 |
| COD | mg/L | 65 | 59.18 | 0.0 | 450.0 | 46.0 | 170.0 | 450.0 |
| NO ₃ + NO ₂ nitrogen | mg/L | 64 | 0.83 | 0.00 | 6.97 | 0.512 | 2.8 | 6.97 |
| Total Kjeldahl nitrogen | mg/L | 62 | 1.46 | 0.0 | 10.2 | 1.05 | 4.29 | 10.20 |
| Oil and grease | mg/L | 69 | 0.58 | 0.00 | 9.0 | 0.0 | 5.0 | 9.0 |
| pH | s.u. ... | 69 | N/A | 5.04 | 8.8 | N/A | N/A | N/A |
| Total phosphorus | mg/L | 64 | 1.50 | 0.01 | 80.1 | 0.132 | 1.1 | 80.10 |
| TSS | mg/L | 63 | 89.21 | 1.0 | 610.0 | 29.00 | 348.0 | 610.0 |

For the majority of the pollutants, the grab sample results are somewhat higher than the composite results indicating a moderate "first flush" effect. Overall, the results summarized in Table AC-3

do not differ substantially from the NURP results. As with the NURP results, these data indicate wide variability in the monitoring results.

EPA has also reviewed the monitoring results for nonconventional and priority

toxic pollutants required by Parts B and C of Form 2F. Table AC-4 summarizes the results for parameters where at least some of the reported values exceeded NURP averages and may be a result of industrial activities at the facilities.

TABLE AC-4.—RESULTS FOR NONCONVENTIONAL AND PRIORITY TOXIC POLLUTANTS

| Pollutant | Unit | Number of obs./detects grab samples | Range grab samples | Number of obs./detects comp. samples | Range composite samples | Range NURP |
|--------------|------|-------------------------------------|--------------------|--------------------------------------|-------------------------|---------------|
| Copper | mg/L | 54/24 | 0.00–1.00 | 50/14 | 0.00–.06 | .001–.1 |
| Lead | mg/L | 60/24 | 0.00–.57 | 56/13 | 0.00–.17 | 0.006–.46 |
| Silver | mg/L | 52/4 | 0.00–0.01 | 48/3 | 0.00–0.01 | 0.0002–0.0008 |
| Zinc | mg/L | 51/38 | 0.00–1.1 | 48/37 | 0.00–1.2 | .01–2.4 |

EPA contacted certain group members to try to determine more specifically the possible sources of the pollutants reported above. Copper is widely used in the manufacture of electrical products and was commonly detected in storm water samples. However, only one grab sample (10 mg/L) exceeded by a wide margin the weighted mean for copper (.43 mg/L) in Table AC-3 reported by the NURP study. In this case the copper was thought to be a result of leaks associated with the maintenance of a waste tank containing copper. Other readings for copper which exceeded the NURP average were thought to result from factors such as the leaching of old pipes or from soils naturally high in copper.

One grab sample was reported in which lead was detected at a level (0.57

mg/L) which exceeded the range reported in the NURP study. However, the facility in question could not explain the result and indicated that minimal amounts of lead are used at the facility. Facilities which reported elevated levels in zinc were also uncertain as to the source; however, leaching of old pipes was suggested as a possibility.

One facility reported a concentration of 0.01 mg/L for silver in storm water runoff. Although a special silver based solder is used onsite, the facility could still not explain the monitoring result.

Facilities in this sector utilize and also conducted sampling for a wide variety of nonconventional and priority toxic pollutants in addition to those listed above. While the sampling results did not indicate any special concerns

with regards to other pollutants, it should be noted that the above results are based on the limited sampling activity required by the group application regulations (40 CFR 122.26(c)(2)). Therefore, it would be premature to conclude that the above pollutants are the only pollutants that could ever be present at benchmark levels in the storm water discharges from facilities in this sector.

3. Options for Controlling Pollutants

In evaluating options for controlling pollutants in storm water discharges, EPA must achieve compliance with the technology-based standards of the Clean Water Act (Best Available Technology (BAT) and Best Conventional Technology)). The Agency does not believe that it is appropriate to establish

specific numeric effluent limitations or a specific design or performance standard in this section for storm water discharges associated with industrial activity from facilities which manufacture electronic and electrical equipment and components, and photographic and optical goods to meet BAT/BCT standards of the Clean Water Act. Instead, this section establishes requirements for the development and implementation of site-specific storm water pollution prevention plans consisting of a set of Best Management Practices (BMPs) that are sufficiently flexible to address different sources of pollutants at different sites.

Certain BMPs are implemented to prevent and/or minimize exposure of pollutants from industrial activities to storm water discharges. EPA believes the most effective BMPs for reducing pollutants in storm water discharges are exposure minimization practices. Exposure minimization practices lessen the potential for storm water to come into contact with pollutants. Good housekeeping practices ensure that facilities are sensitive to routine and nonroutine activities which may

increase pollutants in storm water discharges. The BMPs which address good housekeeping and exposure minimization are easily implemented, inexpensive, and require little, if any, maintenance. BMP expenses may include construction of roofs for storage areas or other forms of permanent cover and the installation of berms/dikes. Other BMPs such as detention/retention ponds and filtering devices may be needed at these facilities because of the contaminant level in the storm water discharges. The types of BMPs implemented will depend on the type of discharge, types and concentrations of contaminants, and the volume of the flow.

The selection of the most effective BMPs will be based on site-specific considerations such as: facility size, climate, geographic location, geology/hydrology and the environmental setting of each facility, and volume and type of discharge generated. Each facility will be unique in that the source, type, and volume of contaminated storm water discharges will differ. In addition, the fate and transport of pollutants in these

discharges will vary. EPA believes that the management practices discussed herein are well suited mechanisms to prevent or control the contamination of storm water discharges associated with manufacturers of electronic and electrical equipment and components, and photographic and optical goods.

Part 1 group application data indicated that the most widely implemented BMPs are spill prevention and response techniques (used by approximately 68 percent of the sampling facilities) and waste minimization practices (employed by approximately 54 percent of the sampling facilities). However, less than 30 percent of the sampling subgroup reported that they use covering; approximately 3 percent have roofs over their raw materials; and less than 3 percent store raw materials indoors.¹³³ Because BMPs described in part 1 data are generally limited, Table AC-5 is provided to identify BMPs associated with activities that routinely occur at manufacturers of electronic and electrical equipment and components, and photographic and optical goods.

TABLE AC-5.—GENERAL STORM WATER BMPs FOR MANUFACTURERS OF ELECTRONIC AND ELECTRICAL EQUIPMENT AND COMPONENTS, PHOTOGRAPHIC AND OPTICAL GOODS

| Activity | Best management practices (BMPs) |
|-------------------------------------|--|
| Outdoor Unloading and Loading | <p>Confine loading/unloading activities to a designated area.</p> <p>Consider performing loading/unloading activities indoors or in a covered area.</p> <p>Consider covering loading/unloading area with permanent cover (e.g., roofs) or temporary cover (e.g., tarps).</p> <p>Close storm drains during loading/unloading activities in surrounding areas.</p> <p>Avoid loading/unloading materials in the rain.</p> <p>Inspect the unloading/loading areas to detect problems before they occur.</p> <p>Inspect all containers prior to loading/unloading of any raw or spent materials.</p> <p>Consider berming, curbing, or diking loading/unloading areas.</p> <p>Dead-end sump where spilled materials could be directed.</p> <p>Drip pans under hoses.</p> <p>Use dry clean-up methods instead of washing the areas down.</p> <p>Train employees on proper loading/unloading techniques and spill prevention and response.</p> |

¹³³ These percentages were based on the information reported in the Part 1 group applications. However, some facilities which utilize

these BMPs as part of their daily activities may not recognize these practices as BMPs and as a result did not report this information in their applications.

TABLE AC-5.—GENERAL STORM WATER BMPs FOR MANUFACTURERS OF ELECTRONIC AND ELECTRICAL EQUIPMENT AND COMPONENTS, PHOTOGRAPHIC AND OPTICAL GOODS—Continued

| Activity | Best management practices (BMPs) |
|--|--|
| Outdoor Material Storage (including waste, and particulate emission management). | Confine storage of materials, parts, and equipment to designated areas. Consider secondary containment using curbing, berming, or diking all liquid storage areas. Train employees in spill prevention and response techniques. Train employees on proper waste control and disposal. Consider covering tanks. Ensure that all containers are closed (e.g., valves shut, lids sealed, caps closed). Wash and rinse containers indoors before storing them outdoors. If outside or in covered areas, minimize runoff of storm water by grading the land to divert flow away from containers. Leak detection and container integrity testing Direct runoff to onsite retention pond. Inventory all raw and spent materials. Clean around vents and stacks. Place tubs around vents and stacks to collect particulate. Inspect air emission control systems (e.g., baghouses) regularly, and repair or replace when necessary. Store wastes in covered, leak proof containers (e.g., dumpsters, drums). Consider shipping all wastes to offsite landfills or treatment facilities. Ensure hazardous waste disposal practices are performed in accordance with Federal, State, and local requirements. |

Sources: NPDES Storm Water Group Applications—Part 1. Received by EPA, March 18, 1991, through December 31, 1992. EPA, Office of Water, September 1992. "Storm Water Management for Industrial Activities: Developing Pollution Prevention Plans and Best Management Practices." EPA 832-R-92-006.

4. Special Conditions

There are no additional requirements under this section other than those stated in Part VI.B of this fact sheet.

5. Storm Water Pollution Prevention Plan Requirements

There are no additional requirements beyond those described in Part VI.C. of this fact sheet.

6. Numeric Effluent Limitations

No numeric effluent limitations are proposed for facilities in this sector, beyond those described in Part VI.F. of this fact sheet.

7. Monitoring and Reporting Requirements

a. Monitoring requirements. The regulatory modifications at 40 CFR 122.44(i)(2) established on April 2, 1992, grant permit writers the flexibility to reduce monitoring requirements in storm water discharge permits. EPA has determined that the potential for storm water discharges to contain pollutants above benchmark levels, because of the industrial activities and materials exposed to precipitation, does not support sampling at facilities that manufacture electronic and electrical equipment and components, photographic, and optical goods. Based on a consideration of the BMPs typically used at these facilities, and generally low pollutant values from the application data, EPA believes that the pollution prevention plan with visual observations of storm water discharges will help to ensure storm water

contamination is minimized. Because permittees are not required to conduct sampling, they will be able to focus their resources on developing and implementing the pollution prevention plan.

Quarterly visual inspection of a storm water discharge from each outfall are required. The inspection must be of a grab sample collected from each storm water outfall. The examination of storm water grab samples shall include any observations of color, odor, turbidity, floating solids, foam, oil sheen, or other obvious indicators of storm water pollution. The inspection must be conducted in a well lit area. No analytical tests are required to be performed on these samples.

The examination must be made at least once in each designated period during daylight hours unless there is insufficient rainfall or snow-melt to runoff. EPA expects that, whenever practicable, the same individual should carry out the collection and examination of discharges throughout the life of the permit to ensure the greatest degree of consistency possible. Examinations shall be conducted in each of the following periods for the purposes of inspecting storm water quality associated with storm water runoff and snow melt: December to February; March to May; June to August; September to November. Grab samples shall be collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 60 minutes) of when the runoff begins discharging. Reports of the visual observation

include: the examination date and time, examination personnel, visual quality of the storm water discharge, and probable sources of any observed storm water contamination. The visual observation reports must be maintained onsite with the pollution prevention plan.

EPA believes that this quick and simple assessment will help the permittee to determine the effectiveness of his/her plan on a regular basis at very little cost. Although the visual examination cannot assess the chemical properties of the storm water discharged from the site, the examination will provide meaningful results upon which the facility may act quickly. The frequency of this visual inspection will also allow for timely adjustments to be made to the plan. If BMPs are performing ineffectively, corrective action must be implemented. A set of tracking or follow-up procedures must be used to ensure that appropriate actions are taken in response to the inspections. The visual examination is intended to be performed by members of the pollution prevention team. This hands-on inspection will enhance the staff's understanding of the storm water problems on that site and the effects of the management practices that are included in the plan.

When a discharger is unable to collect samples over the course of the monitoring period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions which may prohibit the collection of samples include

weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

As discussed above, EPA does not believe that chemical monitoring is necessary for facilities that manufacture electronic and electrical equipment and components, photographic, and optical goods. EPA believes that between quarterly visual inspections and site compliance evaluations potential sources of contaminants can be recognized, addressed, and then controlled with BMPs. In determining the monitoring requirements, EPA considered the nature of the industrial activities and significant materials exposed at these sites, and performed a review of data provided in Part 2 group applications.

8. Alternative Monitoring Requirements

EPA requests comment upon the following monitoring and reporting requirements in lieu of those listed in Part XI.AC. of today's proposed permit.

a. Annual monitoring requirements.

During the period beginning on the effective date and lasting through the expiration date of this permit, and except as provided in VI.E.3., 6. and 7. (Sampling Waiver, Representative Discharge, and Alternative Certification), or VIII.AC.8.c. (Exemptions From Storm Water Monitoring), facilities covered under this section of the permit shall monitor storm water discharges associated with industrial activity once per year for the following pollutants:

- Oil and grease, COD, TSS, and pH; and
- Any additional toxic pollutants that the permittee finds in the Description of Potential Pollutant Sources [Section VI.C.2 above] and may be present in storm water discharges in significant quantities.

Permittees must retain monitoring results in accordance with Part VI.E.4. (Retention of Records). In addition to the parameters listed below, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event which generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

b. Sample type. All samples shall be collected as grab samples. All such

samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable.

c. Exemptions from storm water monitoring. Storm water monitoring may be discontinued on a pollutant-by-pollutant basis for the pollutants specified in VIII.AC.8. above if two successive samples indicate that a particular pollutant is not present in significant quantities. Monitoring may be discontinued entirely if two successive samples indicate that no pollutants are found in significant quantities.

d. Quarterly visual examination of storm water runoff. (1) On a quarterly basis, permittees shall conduct a visual examination of storm water discharges from each outfall which discharges storm water associated with industrial activity. If the facility has two or more outfalls with substantially identical effluents (based on a consideration of industrial activity, significant materials, and management practices and activities in the area drained by the outfall), the visual examination may be conducted on only one such outfall.

(2) The examination must be made at least once in each designated period during daylight hours unless there is insufficient rainfall or snow-melt to produce a runoff event. Examinations shall be conducted in each of the following periods for purposes of inspecting storm water quality associated with storm water runoff and snow-melt: December to February (storm water runoff or snow-melt); March to May (storm water runoff); June to August (storm water runoff); and September to November (storm water runoff or snow-melt).

(3) Examinations shall be conducted within the first 30 minutes (or as soon thereafter as practical, but not to exceed 60 minutes) of when the runoff begins discharging. The examinations shall include any observations of color, odor, turbidity, floating solids, foam, oil sheen or other obvious indications of storm water pollution. No analytical tests are required to be performed. Examinations shall be conducted so as to provide a reasonable representation of the nature

of a typical storm water discharge at that site during that time of year.

(4) Information must be maintained onsite and include: the examination date and time, examination personnel, visual quality of the storm water discharge, and probable sources of any observed storm water contamination.

IX. Paperwork Reduction Act

EPA has reviewed the requirements imposed on regulated facilities in this proposed multi-sector general permit under the Paperwork Reduction Act of 1980, 44 U.S.C. 3501 et seq. The information collection requirements in today's permit have already been approved by the Office of Management and Budget (OMB) in previous submissions made for the NPDES permit program under the provisions of the Clean Water Act.

X. Regulatory Flexibility Act

Under the Regulatory Flexibility Act, 5 U.S.C. 601 et seq., EPA is required to prepare a Regulatory Flexibility Analysis to assess the impact of rules on small entities. Under 5 U.S.C. 605(b), no Regulatory Flexibility Analysis is required, however, where the head of the Agency certifies that the rule will not have a significant economic impact on a substantial number of small entities.

Today's proposed permit will provide any small entity the opportunity to obtain storm water permit coverage as a result of the group application process. Group applications provided small entities a mechanism to reduce their permit application burden by grouping together with other industrial facilities and submitting a common permit application with reduced monitoring requirements and shared costs. The group application information submitted to EPA provided a basis for the development of storm water permit conditions tailored specifically for each industry. The permit requirements have been designed to minimize significant administrative and economic impacts on small entities and should not have a significant impact on industry in general. In addition, small entities and other industrial facilities are encouraged to review and comment on the terms and conditions of the proposed permit and assess the feasibility of permit compliance. Moreover, the proposed permit reduces a significant burden on regulated sources of applying for individual permits.

Accordingly, I hereby certify pursuant to 5 U.S.C. 605(b) that this permit will not have a significant impact on a substantial number of small entities.

Authorization to Discharge Under the National Pollution Discharge Elimination System

In compliance with the provisions of the Clean Water Act, as amended, (33 U.S.C. 1251 et seq., the "Act") except as provided in part I.B.3. of this storm water multi-sector general permit, operators of point source discharges of storm water associated with industrial activity that discharge into waters of the United States, represented by the industry sectors identified in part XI. of this permit, are authorized to discharge in the areas of coverage listed below in accordance with the conditions and requirements set forth herein.

Operators of storm water discharges from the industrial activities covered under this permit who intend to be authorized by this permit must submit an Notice of Intent (NOI) in accordance with part II.B. of this permit. Operators of storm water discharges associated with industrial activity who fail to submit an NOI with part II.B. of this permit are not authorized under this general multi-sector permit.

This permit shall become effective on [leave blank], and shall expire at midnight on [enter five years from effective date].

NPDES General Permit for Storm Water Discharges From Industrial Activities

Table of Contents

I. Coverage Under This Permit

- A. Permit Area
- B. Eligibility
 - 1. Discharges Covered
 - 2. Construction
 - 3. Limitations on Coverage
 - 4. Storm Water Not Associated With Industrial Activity
 - 5. Endangered Species Protection
 - 6. National Historic Preservation Act
 - 7. Discharges Subject to New Source Performance Standards

C. Authorization

II. Notice of Intent Requirements

A. Deadlines for Notification

- 1. Existing Facility
 - 2. New Facility
 - 3. Oil and Gas Operations
 - 4. New Operator
 - 5. Late Notification
- #### B. Contents of Notice of Intent
- 1. Permit
 - 2. Name
 - 3. Location
 - 4. Indian Lands
 - 5. Receiving Water
 - 6. Co-permittee
 - 7. Monitoring
 - 8. SIC Code
 - 9. Other Permits
 - 10. Eligibility Certification
 - 11. Pollution Prevention Plan Certification
- #### C. Where to Submit
- #### D. Additional Notification

III. Special Conditions

A. Prohibition of Non-storm Water Discharges

- 1. Storm Water Discharges
 - 2. Non-storm Water Discharges
- #### B. Releases in Excess of Reportable Quantities

- 1. Hazardous Substances or Oil
- 2. Multiple Anticipated Discharges
- 3. Spills

C. Co-located Industrial Activity

IV. Storm Water Pollution Prevention Plans

A. Deadlines for Plan Preparation and Compliance

- 1. Existing Facilities
- 2. New Facilities
- 3. Oil and Gas Facilities
- 4. Facilities Previously Subject to the Baseline General Permit
- 5. Measures That Require Construction
- 6. Extensions

B. Signature and Plan Review

- 1. Signature/Location
- 2. Availability
- 3. Required Modifications
- 4. Keeping Plans Current
- 5. Contents of the Plan

D. Special Pollution Prevention Plan Requirements

- 1. Additional Requirements for Storm Water Discharges Associated With Industrial Activity Through Municipal Separate Storm Sewer Systems Serving a Population of 100,000 or More
- 2. Additional Requirements for Storm Water Discharges Associated With Industrial Activity From Facilities Subject to EPCRA Section 313 Requirements
- 3. Additional Requirements for Salt Storage
- 4. Consistency With Other Plans

V. Numeric Effluent Limitations

- A. Discharges Associated With Specific Industrial Activity
- B. Coal Pile Runoff

VI. Monitoring and Reporting Requirements

- A. Monitoring Requirements
 - 1. Limitations on Monitoring Requirements
- B. Reporting: Where to Submit
 - 1. Location
 - 2. Additional Notification
- C. Special Monitoring Requirements
 - 1. Coal Pile Runoff
 - 2. Sample Type
 - 3. Sampling Waiver
 - 4. Representative Discharge
 - 5. Alternative Certification
 - 6. When to Submit

VII. Standard Permit Conditions

- A. Duty to Comply
 - 1. Permittee's Duty to Comply
 - 2. Penalties for Violations of Permit Conditions
- B. Continuation of the Expired General Permit
- C. Need to Halt or Reduce Activity Not a Defense
- D. Duty to Mitigate
- E. Duty to Provide Information
- F. Other Information
- G. Signatory Requirements
 - 1. Signature
 - 2. Authorized Representative
- H. Penalties for Falsification of Reports
- I. Penalties for Falsification of Monitoring Systems
- J. Oil and Hazardous Substance Liability
- K. Property Rights
- L. Severability
- M. Requiring an Individual Permit or an Alternative General Permit
 - 1. Director Designation
 - 2. Individual Permit Application
 - 3. Individual/Alternative General Permit Issuance

- N. State/Environmental Laws
- O. Proper Operation and Maintenance
- P. Monitoring and Records
 - 1. Representative Samples/Measurements
 - 2. Retention of Records
 - 3. Records Contents
 - 4. Approved Monitoring Methods

- Q. Inspection and Entry
- R. Permit Actions
 - 1. Notice
 - 2. Prohibition of Bypass
- T. Upset Conditions
 - 1. Affirmative Defense
 - 2. Required Defense
 - 3. Burden of Proof

VIII. Reopener Clause

- A. Potential or Realized Impacts on Water Quality

B. Applicable Regulations

IX. Termination of Coverage

A. Notice of Termination

- 1. Facility Information
- 2. Operator Information
- 3. Permit Number
- 4. Reason for Termination
- 5. Certification

B. Addresses

X. Definitions

XI. Specific Requirements for Industrial Activities

A. Storm Water Discharges Associated With Industrial Activity From Timber Products Facilities

- 1. Discharges Covered Under This Section
- 2. Special Conditions
- 3. Storm Water Pollution Prevention Plan Requirements

4. Numeric Effluent Limitations

5. Monitoring and Reporting Requirements

B. Storm Water Discharges Associated With Industrial Activity From Paper And Allied Products Manufacturing Facilities

- 1. Discharges Covered Under This Section
- 2. Special Conditions
- 3. Storm Water Pollution Prevention Plan Requirements

4. Numeric Effluent Limitations

5. Monitoring and Reporting Requirements

C. Storm Water Discharges Associated With Industrial Activity From Chemical and Allied Products Manufacturing Facilities

- 1. Discharges Covered Under This Section
- 2. Discharges Not Covered By This Section
- 3. Special Conditions

4. Storm Water Pollution Prevention Plan Requirements

5. Numeric Effluent Limitations

6. Monitoring and Reporting Requirements

D. Storm Water Discharges Associated With Industrial Activity From Asphalt Paving and Roofing Materials and Lubricant Manufacturers

- 1. Discharges Covered Under This Section
- 2. Special Conditions
- 3. Storm Water Pollution Prevention Plan Requirements

4. Numeric Effluent Limitations

5. Monitoring and Reporting Requirements

E. Storm Water Discharges Associated With Industrial Activity From Glass, Clay, Cement, Concrete, and Gypsum Product Manufacturing Facilities

- 1. Discharges Covered Under This Section
- 2. Special Conditions
- 3. Storm Water Pollution Prevention Plan Requirements

4. Numeric Effluent Limitations

5. Monitoring and Reporting Requirements

F. Storm Water Discharges Associated With Industrial Activity From Primary Metals Facilities

- 1. Discharges Covered Under This Section
- 2. Special Conditions
- 3. Storm Water Pollution Prevention Plan Requirements

4. Numeric Effluent Limitations

5. Monitoring and Reporting Requirements

G. Storm Water Discharges Associated With Industrial Activity From Metal Mining (Ore Mining and Dressing) Facilities

- 1. Discharges Covered Under This Section
- 2. Special Definitions

3. Storm Water Pollution Prevention Plan Requirements
4. Numeric Effluent Limitations
5. Monitoring and Reporting Requirements
- H. Storm Water Discharges Associated With Industrial Activity From Coal Mines and Coal Mining-Related Facilities
 1. Discharges Covered Under This Section
 2. Special Conditions
3. Storm Water Pollution Prevention Plan Requirements
4. Numeric Effluent Limitations
5. Monitoring and Reporting Requirements
- I. Storm Water Discharges Associated With Industrial Activity From Oil and Gas Extraction Facilities
 1. Discharges Covered Under This Section
 2. Special Conditions
3. Storm Water Pollution Prevention Plan Requirements
4. Numeric Effluent Limitations
5. Monitoring and Reporting Requirements
- J. Storm Water Discharges Associated With Industrial Activity From Mineral Mining and Processing Facilities
 1. Discharges Covered Under This Section
 2. Special Conditions
3. Storm Water Pollution Prevention Plan Requirements
4. Numeric Effluent Limitations
5. Monitoring and Reporting Requirements
- K. Storm Water Discharges Associated With Industrial Activity From Hazardous Waste Treatment, Storage, or Disposal Facilities
 1. Discharges Covered Under This Section
 2. Special Conditions
3. Storm Water Pollution Prevention Plan Requirements
4. Numeric Effluent Limitations
5. Monitoring and Reporting Requirements
- L. Storm Water Discharges Associated With Industrial Activity From Landfills and Land Application Sites
 1. Discharges Covered Under This Section
 2. Special Conditions
3. Storm Water Pollution Prevention Plan Requirements
4. Numeric Effluent Limitations
5. Monitoring and Reporting Requirements
6. Definition
- M. Storm Water Discharges Associated With Industrial Activity From Automobile Salvage Yards
 1. Discharges Covered Under This Section
 2. Storm Water Pollution Prevention Plan Requirements
3. Storm Water Pollution Prevention Plan Requirements
4. Numeric Effluent Limitations
5. Monitoring and Reporting Requirements
5. Retention of Records
- N. Storm Water Discharges Associated With Industrial Activity From Scrap and Waste Material Processing and Recycling Facilities
 1. Discharges Covered Under This Section

3. Storm Water Pollution Prevention Plan Requirements
4. Numeric Effluent Limitations
5. Monitoring and Reporting Requirements
- S. Storm Water Discharges Associated With Industrial Activity From Vehicle Maintenance Areas, Equipment Cleaning Areas, or Deicing Areas Located at Air Transportation Facilities
 1. Discharges Covered Under This Section
 2. Special Conditions
3. Storm Water Pollution Prevention Plan Requirements
4. Numeric Effluent Limitations
5. Monitoring and Reporting Requirements
- T. Storm Water Discharges Associated With Industrial Activity From Treatment Works
 1. Discharges Covered Under This Section
 2. Special Conditions
3. Storm Water Pollution Prevention Plan Requirements
4. Numeric Effluent Limitations
5. Monitoring and Reporting Requirements
- U. Storm Water Discharges Associated With Industrial Activity From Food and Kindred Products Facilities
 1. Discharges Covered Under This Section
 2. Special Conditions
3. Storm Water Pollution Prevention Plan Requirements
4. Numeric Effluent Limitations
5. Monitoring and Reporting Requirements
- V. Storm Water Discharges Associated With Industrial Activity From Textile Mills, Apparel, and Other Fabric Product Manufacturing Facilities
 1. Discharges Covered Under This Section
 2. Special Conditions
3. Storm Water Pollution Prevention Plan Requirements
4. Numeric Effluent Limitations
5. Monitoring and Reporting Requirements
4. Numeric Effluent Limitations
5. Monitoring and Reporting Requirements
- W. Storm Water Discharges Associated With Industrial Activity From Wood and Metal Furniture and Fixture Manufacturing Facilities
 1. Discharges Covered Under This Section
 2. Special Conditions
3. Storm Water Pollution Prevention Plan Requirements
4. Numeric Effluent Limitations
5. Monitoring and Reporting Requirements
- X. Storm Water Discharges Associated With Industrial Activity From Printing and Publishing Facilities
 1. Discharges Covered Under This Section
 2. Special Conditions
3. Storm Water Pollution Prevention Plan Requirements
4. Numeric Effluent Limitations
5. Monitoring and Reporting Requirements
- Y. Storm Water Discharges Associated With Industrial Activity From Rubber, Miscellaneous Plastic Products, and Miscellaneous Manufacturing Industries
 1. Discharges Covered Under This Section
 2. Special Conditions
3. Storm Water Pollution Prevention Plan Requirements
4. Numeric Effluent Limitations
5. Monitoring and Reporting Requirements
- Z. Storm Water Discharges Associated With Industrial Activity From Leather Tanning and Finishing Facilities
 1. Discharges Covered Under This Section
 2. Special Conditions
3. Storm Water Pollution Prevention Plan Requirements
4. Numeric Effluent Limitations
5. Monitoring and Reporting Requirements
- AA. Storm Water Discharges Associated With Industrial Activity From Fabricated Metal Products Industry
 1. Discharges Covered Under This Section
 2. Special Conditions
3. Storm Water Pollution Prevention Plan Requirements
4. Numeric Effluent Limitations
5. Monitoring and Reporting Requirements
- AB. Storm Water Discharges Associated With Industrial Activity From Facilities That Manufacture Transportation Equipment, Industrial, or Commercial Machinery
 1. Discharges Covered Under This Section
 2. Special Conditions
3. Storm Water Pollution Prevention Plan Requirements
4. Numeric Effluent Limitations
5. Monitoring and Reporting Requirements
- AC. Storm Water Discharges Associated With Industrial Activity From Facilities That Manufacture Electronic and Electrical Equipment and Components, Photographic and Optical Goods
 1. Discharges Covered Under This Section
 2. Special Conditions
3. Storm Water Pollution Prevention Plan Requirements
4. Numeric Effluent Limitations
5. Monitoring and Reporting Requirements

Addenda

Addendum A—Pollutants Identified in Tables II and III of Appendix D of 40 CFR part 122

Addendum B—Notice of Intent (NOI) Form (an NOI will not appear in today's proposed permit but will be included in the final rule)

Addendum C—Notice of Termination (NOT) Form (an NOT will not appear in today's proposed permit but will be included in the final rule)

Addendum D—Large, Medium, and Designated Municipalities

Addendum E—Basic Format for Environmental Assessment

Addendum F—Section 313 Water Priority Chemicals

Addendum G—Region-Specific Permit Conditions

I. Coverage Under This Permit

A. Permit Area

The permit covers all areas of:

Region I—for the States of Maine, Massachusetts, and New Hampshire; for Indian lands located in Connecticut, Massachusetts, New Hampshire, Maine, Rhode Island, and Vermont; and for Federal facilities in Vermont.

Region II—for the Commonwealth of Puerto Rico; for Indian lands located in New York; and for Federal facilities in the U.S. Virgin Islands.

Region III—for the District of Columbia and for Federal facilities in Delaware.

Region IV—for the State of Florida; and for Indian lands located in Alabama, Florida, Mississippi, and North Carolina.

Region VI—for the States of Louisiana, New Mexico, Oklahoma, and Texas; and for Indian lands located in Louisiana, New Mexico (except Navajo lands and Ute Mountain Reservation lands), Oklahoma, and Texas.

Region VIII—for the State of South Dakota; for Indian lands located in Colorado, Montana, North Dakota, South Dakota, Utah (except Goshute Reservation and Navajo Reservation lands), and Wyoming; for the portion of the Pine Ridge Reservation located in Nebraska; for the Ute Mountain Reservation in Colorado and New Mexico; and for Federal facilities in Colorado.

Region IX—for the State of Arizona; for the Territories of American Samoa, Guam, Johnston Atoll, and Midway and Wake Island; for the Commonwealth of

the Northern Mariana Islands; for the Republic of Palau (Trust Territory of the Pacific Islands); and for Indian lands located in California and Nevada; and for the Goshute Reservation in Utah and Nevada, the Navajo Reservation in Utah, New Mexico, and Arizona, the Duck Valley Reservation in Nevada and Idaho; and the Fort McDermitt Reservation in Oregon and Nevada.

Region X—for the State of Alaska, and Idaho; for Indian lands located in Alaska, Oregon (except for Fort McDermitt Reservation lands), Idaho (except Duck Valley Reservation lands), and Washington; and for Federal facilities in Washington.

B. Eligibility

1. *Discharges covered.* Except for storm water discharges identified under paragraph I.B.3., this permit may cover all new and existing point source discharges of storm water to waters of the United States that are associated with industrial activity identified under the eligibility sections contained in Part XI. (see Table 1).

TABLE 1

| Storm water discharges from | Are eligible for coverage if listed in part |
|---|---|
| Timber Products Facilities | XI.A.1. |
| Paper and Allied Products Manufacturing Facilities | XI.B.1. |
| Chemical and Allied Products Manufacturing Facilities | XI.C.1. |
| Asphalt Paving, Roofing Materials, and Lubricant Manufacturing Facilities | XI.D.1. |
| Glass, Clay, Cement, Concrete, and Gypsum Product Manufacturing Facilities | XI.E.1. |
| Primary Metals Facilities | XI.F.1. |
| Metal Mines (Ore Mining and Dressing) | XI.G.1. |
| Coal Mines and Coal Mine-Related Facilities | XI.H.1. |
| Oil or Gas Extraction Facilities | XI.I.1. |
| Mineral Mining and Processing Facilities | XI.J.1. |
| Hazardous Waste Treatment Storage or Disposal Facilities | XI.K.1. |
| Landfills and Land Application Sites | XI.L.1. |
| Automobile Salvage Yards | XI.M.1. |
| Scrap and Waste Material Processing and Recycling Facilities | XI.N.1. |
| Steam Electric Power Generating Facilities | XI.O.1. |
| Vehicle Maintenance or Equipment Cleaning areas at Motor Freight Transportation Facilities, Passenger Transportation Facilities, Petroleum Bulk Oil Stations and Terminals, the United States Postal Service, or Railroad Transportation Facilities | XI.P.1. |
| Vehicle Maintenance Areas and Equipment Cleaning Areas of Water Transportation Facilities | XI.Q.1. |
| Ship or Boat Building and Repair Yards | XI.R.1. |
| Vehicle Maintenance Areas, Equipment Cleaning Areas or From Airport Deicing Operations located at Air Transportation Facilities | XI.S.1. |
| Wastewater Treatment Works | XI.T.1. |
| Food and Kindred Products Facilities | XI.U.1. |
| Textile Mills, Apparel and other Fabric Product Manufacturing Facilities | XI.V.1. |
| Furniture and Fixture Manufacturing Facilities | XI.W.1. |
| Printing and Publishing Facilities | XI.X.1. |
| Rubber and Miscellaneous Plastic Product Manufacturing Facilities | XI.Y.1. |
| Leather Tanning and Finishing Facilities | XI.Z.1. |
| Facilities That Manufacture Metal Products including Jewelry, Silverware and Plated Ware | XI.AA.1. |
| Facilities That Manufacture Transportation Equipment, Industrial or Commercial Machinery | XI.AB.1. |
| Facilities That Manufacture Electronic and Electrical Equipment and Components, Photographic and Optical Goods | XI.AC.1. |

2. *Construction.* This permit may authorize storm water discharges associated with industrial activity that

are mixed with storm water discharges associated with industrial activity from construction activities provided that the

storm water discharge from the construction activity is authorized by and in compliance with the terms of a

different NPDES general permit or individual permit authorizing such discharges.

3. *Limitations on coverage.* The following storm water discharges associated with industrial activity are not authorized by this permit:

a. Storm water discharges associated with industrial activities that are not listed under the eligibility sections contained in Part XI. (see Table 1).

b. Storm water discharges subject to New Source Performance Standards except as provided in Part I.B.7. below.

c. Storm water discharges associated with industrial activity that are mixed with sources of non-storm water other than non-storm water discharges that are:

(1) In compliance with a different NPDES permit; or

(2) Identified by and in compliance with Part III.A. (Prohibition of Non-storm Water Discharges) of this permit.

d. Storm water discharges associated with industrial activity that are subject to an existing NPDES individual or general permit (except storm water discharges subject to the NPDES General Permit for Storm Water Discharges Associated With Industrial Activity published September 9, 1992 [57 FR 41297], or September 25, 1992 [57 FR 44438]), are located at a facility where an NPDES permit has been terminated (other than at the request of the permittee) or denied, or that are issued a permit in accordance with Part VII.M (Requirements for Individual or Alternative General Permits) of this permit;

e. Storm water discharges associated with industrial activity that the Director [U.S. Environmental Protection Agency (EPA)] has determined to be or may reasonably be expected to be contributing to a violation of a water quality standard;

4. *Storm water not associated with industrial activity.* Storm water discharges associated with industrial activity that are authorized by this permit may be combined with other sources of storm water that are not classified as associated with industrial activity pursuant to 40 CFR 122.26(b)(14).

5. *Endangered species protection.* In order to be eligible for coverage under this permit, the applicant must ensure compliance with the Endangered Species Act. A discharge of storm water associated with industrial activity may be covered under this permit only if either:

(i) The storm water discharge has no direct or indirect effect on a listed endangered or threatened species or its designated critical habitat, or

(ii) The applicant has obtained and is in compliance with an effective incidental take permit issued by either the U.S. Fish and Wildlife Service or National Marine Fisheries Service pursuant to Section 10(a) of the Endangered Species Act.

6. *National Historic Preservation Act.* In order to be eligible for coverage under this permit, the applicant must ensure compliance with the National Historic Preservation Act. A discharge of storm water associated with industrial activity may be covered under this permit only if either:

(i) The storm water discharge will not disturb a site that is listed or is eligible for listing in the National Historic Register maintained by the Secretary of Interior, or

(ii) The applicant has obtained and is in compliance with a written agreement between the applicant and the State Historic Preservation Officer (SHPO) that is signed by the SHPO and that outlines all measures to be undertaken by the applicant to mitigate or prevent adverse effects to the historic site.

7. *Discharges subject to new source performance standards.* Operators of facilities with storm water discharges subject to New Source Performance Standards¹ shall have documentation of a final Agency decision indicating that the Agency has determined that the storm water discharge has no direct or indirect impact. This documentation shall be obtained and retained on site prior to the submittal of the Notice of Intent. Operators of these facilities shall not be authorized under the terms and conditions of this permit until the submittal of a Notice of Intent to gain coverage under this permit. Where documentation of the Agency's decision has not been obtained for a facility subject to New Source Performance Standards, the operator must obtain such documentation prior to submitting an NOI. The permittee may use the format in Addendum E to submit information to EPA to initiate the

¹ Storm water discharges subject to New Source Performance Standards (NSPS) and that may be covered under this permit include: runoff from material storage piles at cement manufacturing facilities (40 CFR Part 411 Subpart C (established February 23, 1977)); contaminated runoff from phosphate fertilizer manufacturing facilities (40 CFR Part 418 Subpart A (established April 8, 1974)); coal pile runoff at steam electric generating facilities (40 CFR Part 423 (established November 19, 1982)); and runoff from asphalt emulsion facilities (40 CFR Part 443 Subpart A (established July 24, 1975)). NSPS apply only to discharges from those facilities or installations that were constructed after the promulgation of NSPS. For example, storm water discharges from areas where the production of asphalt paving and roofing emulsions occurs are subject to NSPS only if the asphalt emulsion facility was constructed after July 24, 1975.

process of the environmental review. The information shall be sent to the appropriate address listed in Part VI.B. of this permit. In order to maintain eligibility, the permittee must implement any mitigation required of the facility as a result of the NEPA review process. Failure to implement mitigation measures upon which the Agency's NEPA finding is based is grounds for termination of permit coverage.

C. Authorization

Dischargers of storm water associated with industrial activity must submit an NOI in accordance with the requirements of Part II of this permit, using an NOI form as found in Addendum C (or photocopy thereof), to be authorized to discharge under this general permit.² Unless notified by the Director to the contrary, owners or operators who submit such notification are authorized to discharge storm water associated with industrial activity under the terms and conditions of this permit 2 days after the date that the NOI is postmarked. The Director may deny coverage under this permit and require submittal of an application for an individual NPDES permit based on a review of the NOI or other information.

II. Notice of Intent Requirements

A. Deadlines for Notification

1. *Existing facility.* Except as provided in paragraphs II.A.4. (New Operator), and II.A.5. (Late Notification), individuals who intend to obtain coverage for an existing storm water discharge associated with industrial activity under this general permit shall submit an NOI in accordance with the requirements of this part on or before [insert date 90 days after permit finalization];

2. *New facility.* Except as provided in paragraphs II.A.3. (Oil and Gas Operations), II.A.4. (New Operator), and II.A.5. (Late Notification), operators of facilities that begin industrial activity after [insert date 90 days after permit finalization] shall submit an NOI in accordance with the requirements of this part at least 2 days prior to the commencement of the industrial activity at the facility;

3. *Oil and gas operations.* Operators of oil and gas exploration, production, processing, or treatment operations or transmission facilities, that are not required to submit a permit application as of [insert date 90 days after permit finalization] in accordance with 40 CFR

² A copy of the approved NOI form is not provided in today's proposed permit; however, it will be included in Addendum C of the final notice.

122.26(c)(1)(iii), but that after [insert date 90 days after permit finalization] have a discharge of a reportable quantity of oil or a hazardous substance for which notification is required pursuant to either 40 CFR 110.6, 40 CFR 117.21, or 40 CFR 302.6, must submit an NOI in accordance with the requirements of Part II.C. of this permit within 14 calendar days of the first knowledge of such release.

4. *New operator.* Where the operator of a facility with a storm water discharge associated with industrial activity that is covered by this permit changes, the new operator of the facility must submit an NOI in accordance with the requirements of this part at least 2 days prior to the change.

5. *Late notification.* An operator of a storm water discharge associated with industrial activity is not precluded from submitting an NOI in accordance with the requirements of this part after the dates provided in Parts II.A.1., 2., 3., or 4. (above) of this permit. In such instances, EPA may bring appropriate enforcement actions.

B. Contents of Notice of Intent

The NOI shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit and shall include the following information:

1. *Permit.* An indication of which NPDES storm water general permit is being applied for;

2. *Name.* The operator's name, address, telephone number, and status as Federal, State, private, public, or other entity;

3. *Location.* The street address of the facility for which the notification is submitted. Where a street address for the site is not available, the location of the approximate center of the facility must be described in terms of the latitude and longitude to the nearest 15 seconds, or the quarter section, township and range (to the nearest quarter section);

4. *Indian lands.* An indication of whether the facility is located on Indian Lands;

5. *Receiving water.* The name of the receiving water(s), or if the discharge is through a municipal separate storm sewer, the name of the municipal operator of the storm sewer and the ultimate receiving water(s) for the discharge through the municipal separate storm sewer;

6. *Co-permittee.* The storm water general permit number if such a number has been issued to a co-permittee;

7. *Monitoring.* The monitoring status of the facility;

8. *SIC code.* Up to four 4-digit Standard Industrial Classification (SIC)

codes that best represent the principal products produced or services rendered, or for hazardous waste treatment, storage or disposal facilities, land/disposal facilities that receive or have received any industrial waste, steam electric power generating facilities, or treatment works treating domestic sewage, a narrative identification of those activities;

9. *Other permits.* The permit number(s) of additional NPDES permit(s) for any discharge(s) (including non-storm water discharges) from the site that are currently authorized by an NPDES permit;

10. *Eligibility certification.* The following certification shall be signed in accordance with Part VII.G.

I certify under penalty of law that I have read and understand the Part I.B. Eligibility requirements for coverage under the general NPDES Multi-sector storm water permit for which this Notice of Intent is being submitted, including those eligibility requirements relating to protection of; endangered or threatened species under the Endangered Species Act, and sites that are either listed or eligible for listing in the National Historic Register under the National Historic Preservation Act. To the best of my knowledge the discharges covered under this Notice are eligible for coverage. I further certify that I understand that continued authorization to discharge under this permit is contingent on maintaining eligibility as provided in Part I.B.;

11. *Pollution prevention plan certification.* For any facility that begins to discharge storm water associated with industrial activity after [insert date 270 days after permit finalization], a certification that a storm water pollution prevention plan has been prepared for the facility in accordance with Part IV. of this permit. (Do not include a copy of the plan with the NOI submission.)

C. Where to Submit

Facilities that discharge storm water associated with industrial activity must use an NOI form provided by the Director (or photocopy thereof). NOIs must be signed in accordance with Part VII.G. (Signatory Requirements) of this permit. NOIs are to be submitted to the Director of the NPDES program in care of the following address:
[Address to be provided in Final Notice.]

D. Additional Notification

Facilities that discharge storm water associated with industrial activity through large or medium municipal separate storm sewer systems (systems located in an incorporated city with a population of 100,000 or more, or in a county identified as having a large or medium system (see definition in Part

X. of this permit and Addendum D of this notice)), or into a municipal separate storm sewer that has been designated by the permitting authority shall, in addition to filing copies of the NOI in accordance with paragraph II.C., submit signed copies of the NOI to the operator of the municipal separate storm sewer through which they discharge in accordance with the deadlines in Part II.A. (Deadlines for Notification) of this permit.

III. Special Conditions

A. Prohibition of Non-storm Water Discharges

1. *Storm water discharges.* Except as provided in paragraph III.A.2 (below), all discharges covered by this permit shall be composed entirely of storm water.

2. *Non-storm water discharges.* a. Except as provided in paragraph III.A.2.b (below), discharges of material other than storm water must be in compliance with an NPDES permit (other than this permit) issued for the discharge.

b. The following non-storm water discharges may be authorized by this permit provided the non-storm water component of the discharge is in compliance with Part IV. discharges from fire fighting activities; fire hydrant flushings; potable water sources including waterline flushings; irrigation drainage; lawn watering; routine external building washdown that does not use detergents or other compounds; pavement washwaters where spills or leaks of toxic or hazardous materials have not occurred (unless all spilled material has been removed) and where detergents are not used; air conditioning condensate; uncontaminated springs; uncontaminated ground water; and foundation or footing drains where flows are not contaminated with process materials such as solvents.

B. Releases in Excess of Reportable Quantities

1. *Hazardous substances or oil.* The discharge of hazardous substances or oil in the storm water discharge(s) from a facility shall be prevented or minimized in accordance with the applicable storm water pollution prevention plan for the facility. This permit does not relieve the permittee of the reporting requirements of 40 CFR Part 117 and 40 CFR Part 302. Except as provided in paragraph III.B.2 (Multiple Anticipated Discharges) of this permit, where a release containing a hazardous substance in an amount equal to or in excess of a reporting quantity established under either 40

CFR Part 117 or 40 CFR Part 302, occurs during a 24-hour period:

a. The discharger is required to notify the National Response Center (NRC) (800-424-8802; in the Washington, DC metropolitan area 202-426-2675) in accordance with the requirements of 40 CFR Part 117 and 40 CFR Part 302 as soon as he or she has knowledge of the discharge;

b. The storm water pollution prevention plan required under Part IV. (Storm Water Pollution Prevention Plans) of this permit must be modified within 14 calendar days of knowledge of the release to: Provide a description of the release, the circumstances leading to the release, and the date of the release. In addition, the plan must be reviewed by the permittee to identify measures to prevent the reoccurrence of such releases and to respond to such releases, and the plan must be modified where appropriate; and

c. The permittee shall submit within 14 calendar days of knowledge of the release a written description of: The release (including the type and estimate of the amount of material released), the date that such release occurred, the circumstances leading to the release, and steps to be taken in accordance with paragraph III.B.1.b. (above) of this permit to the appropriate EPA Regional Office at the address provided in Part VI.B. (Reporting: Where to Submit) of this permit.

2. *Multiple anticipated discharges.* Facilities that have more than one anticipated discharge per year containing the same hazardous substance in an amount equal to or in excess of a reportable quantity established under either 40 CFR Part 117 or 40 CFR Part 302, that occurs during a 24-hour period, where the discharge is caused by events occurring within the scope of the relevant operating system shall:

a. Submit notifications in accordance with Part III.B.1.b. (above) of this permit for the first such release that occurs during a calendar year (or for the first year of this permit, after submittal of an NOI); and

b. Shall provide in the storm water pollution prevention plan required under Part IV. (Storm Water Pollution Prevention Plan) a written description of the dates on which all such releases occurred, the type and estimate of the amount of material released, and the circumstances leading to the release. In addition, the plan must be reviewed to identify measures to prevent or minimize such releases and the plan must be modified where appropriate.

3. *Spills.* This permit does not authorize the discharge of hazardous

substances or oil resulting from an onsite spill.

C. Co-located Industrial Activity

Co-located industrial activities located at facilities described in Part XI. of this permit are those activities that support the primary industrial activity of the facility. Storm water discharges from co-located industrial activities are authorized by this permit, provided that the industrial facility complies with the additive pollution prevention plan and monitoring requirements applicable to the co-located industrial activity. The operator of the facility shall determine which additional pollution prevention plan and monitoring requirements are applicable to the co-located industrial activity by examining the narrative descriptions of the sections in Part XI. of this permit.

IV. Storm Water Pollution Prevention Plans

A storm water pollution prevention plan shall be developed for each facility covered by this permit. Storm water pollution prevention plans shall be prepared in accordance with good engineering practices and in accordance with the factors outlined in 40 CFR 125.3(d)(2) or (3) as appropriate. The plan shall identify potential sources of pollution that may reasonably be expected to affect the quality of storm water discharges associated with industrial activity from the facility. In addition, the plan shall describe and ensure the implementation of practices that are to be used to reduce the pollutants in storm water discharges associated with industrial activity at the facility and to assure compliance with the terms and conditions of this permit. Facilities must implement the provisions of the storm water pollution prevention plan required under this part as a condition of this permit.

A. Deadlines for Plan Preparation and Compliance

1. *Existing facilities.* Except as provided in paragraphs 3., 4., and 5. (below), all existing facilities and new facilities that begin operation on or before [insert date 270 days after permit finalization] shall prepare and implement the plan by [insert date 270 days after permit finalization].

2. *New facilities.* Facilities that begin operation after [insert date 270 days after permit finalization] shall prepare and implement the plan prior to submitting the Notice of Intent.

3. *Oil and gas facilities.* Oil and gas exploration, production, processing or treatment facilities that are not required to submit a permit application on or

before [insert date 90 days after permit finalization] in accordance with 40 CFR 122.26(c)(1)(iii), but after [insert date 270 days after permit finalization] have a discharge of a reportable quantity of oil or a hazardous substance for which notification is required pursuant to either 40 CFR 110.6 or 40 CFR 302.6, shall prepare and implement the plan on or before the date 60 calendar days after first knowledge of such release.

4. *Facilities previously subject to the baseline general permit.* Facilities previously subject to the NPDES General Permit for Storm Water Discharges Associated With Industrial Activity (57 FR 41297 or 57 FR 44438) shall continue to implement the storm water pollution prevention plan required by that permit. The plan shall be revised as necessary to address requirements under Part XI. of this permit no later than [insert date 270 days after permit finalization]. The revisions made to the plan shall be implemented on or before [insert date 270 days after permit finalization].

5. *Measures that require construction.* In cases where construction is necessary to implement measures required by the plan, the plan shall contain a schedule that provides compliance with the plan as expeditiously as practicable, but no later [insert date 3 years after permit finalization].

6. *Extensions.* Upon a showing of good cause, the Director may establish a later date in writing for preparing and compliance with a plan for a storm water discharge associated with industrial activity.

B. Signature and Plan Review

1. *Signature/location.* The plan shall be signed in accordance with Part VII.G. (Signatory Requirements), and be retained onsite at the facility that generates the storm water discharge in accordance with Part VII.P.2. (Retention of Records) of this permit. For inactive facilities, the plan may be kept at the nearest office of the permittee.

2. *Availability.* The permittee shall make plans available upon request to the Director, or authorized representative, or in the case of a storm water discharge associated with industrial activity that discharges through a municipal separate storm sewer system, to the operator of the municipal system.

3. *Required modifications.* The Director, or authorized representative, may notify the permittee at any time that the plan does not meet one or more of the minimum requirements of this part. Such notification shall identify those provisions of the permit that are not being met by the plan, and identify

which provisions of the plan requires modifications in order to meet the minimum requirements of this part. Within 30 days of such notification from the Director, (or as otherwise provided by the Director), or authorized representative, the permittee shall make the required changes to the plan and shall submit to the Director a written certification that the requested changes have been made.

C. Keeping Plans Current

The permittee shall amend the plan whenever there is a change in design, construction, operation, or maintenance,

that has a significant effect on the potential for the discharge of pollutants to the waters of the United States or if the storm water pollution prevention plan proves to be ineffective in eliminating or significantly minimizing pollutants from sources identified under Part IV.D. (Contents of the Plan) of this permit, or in otherwise achieving the general objectives of controlling pollutants in storm water discharges associated with industrial activity. Amendments to the plan may be reviewed by EPA in the same manner as Part IV.B. (above).

D. Contents of the Plan

The contents of the pollution prevention plan shall comply with the requirements listed in the appropriate section of Part XI. (Specific Requirements for Industrial Activities). Table 2 lists the location of the plan requirements for the respective industrial activities. These requirements are cumulative. If a facility has co-located activities that are covered in more than one section of Part XI., that facility's pollution prevention plan must comply with the requirements listed in all applicable sections of this permit.

TABLE 2.—POLLUTION PREVENTION PLAN REQUIREMENTS

| Storm water discharges from | Are subject to pollution prevention plan requirements listed in part |
|---|--|
| Timber Products Facilities | XI.A.3. |
| Paper and Allied Products Manufacturing Facilities | XI.B.3. |
| Chemical and Allied Products Manufacturing Facilities | XI.C.4. |
| Asphalt Paving, Roofing Materials, and Lubricant Manufacturing Facilities | XI.D.3. |
| Glass, Clay, Cement Concrete and Gypsum Product Manufacturing Facilities | XI.E.3. |
| Primary Metals Facilities | XI.F.3. |
| Metal Mines (Ore Mining and Dressing) | XI.G.3. |
| Coal Mines and Coal Mine-Related Facilities | XI.H.3. |
| Oil or Gas Extraction Facilities | XI.I.3. |
| Mineral Mining and Processing Facilities | XI.J.3. |
| Hazardous Waste Treatment Storage or Disposal Facilities | XI.K.3. |
| Landfills and Land Application Sites | XI.L.3. |
| Automobile Salvage Yards | XI.M.3. |
| Scrap and Waste Material Processing and Recycling Facilities | XI.N.3. |
| Steam Electric Power Generating Facilities | XI.O.3. |
| Vehicle Maintenance or Equipment Cleaning areas at Motor Freight Transportation Facilities, Passenger Transportation Facilities, Petroleum Bulk Oil Stations and Terminals, the United States Postal Service, or Railroad Transportation Facilities. | XI.P.3. |
| Vehicle Maintenance Areas and Equipment Cleaning Areas of Water Transportation Facilities | XI.Q.3. |
| Ship or Boat Building and Repair Yards | XI.R.3. |
| Vehicle Maintenance Areas, Equipment Cleaning Areas or From Airport Deicing Operations located at Air Transportation Facilities. | XI.S.3. |
| Wastewater Treatment Works | XI.T.3. |
| Food and Kindred Products Facilities | XI.U.3. |
| Textile Mills, Apparel and other Fabric Product Manufacturing Facilities | XI.V.3. |
| Furniture and Fixture Manufacturing Facilities | XI.W.3. |
| Printing and Publishing Facilities | XI.X.3. |
| Rubber and Miscellaneous Plastic Product Manufacturing Facilities | XI.Y.3. |
| Leather Tanning and Finishing Facilities | XI.Z.3. |
| Facilities That Manufacture Metal Products including Jewelry, Silverware and Plated Ware | XI.AA.3. |
| Facilities That Manufacture Transportation Equipment, Industrial or Commercial Machinery | XI.AB.3. |
| Facilities That Manufacture Electronic and Electrical Equipment and Components, Photographic and Optical Goods | XI.AC.3. |

E. Special Pollution Prevention Plan Requirements

In addition to the minimum standards listed in Part XI. of this permit (Special Requirements for Discharges Associated With Specific Industrial Activities), the storm water pollution prevention plan shall include a complete discussion of measures taken to conform with the following applicable guidelines, other effective storm water pollution prevention procedures, and applicable State rules, regulations and guidelines:

*1. Additional requirements for storm water discharges associated with industrial activity through municipal separate storm sewer systems serving a population of 100,000 or more—*a. In addition to the applicable requirements of this permit, facilities covered by this permit must comply with applicable requirements in municipal storm water management programs developed under NPDES permits issued for the discharge of the municipal separate storm sewer system that receives the facility's

discharge, provided the discharger has been notified of such conditions.

b. Permittees that discharge storm water associated with industrial activity through a municipal separate storm sewer system serving a population of 100,000 or more, or a municipal system designated by the Director shall make plans available to the municipal operator of the system upon request.

2. Additional requirements for storm water discharges associated with industrial activity from facilities subject to EPCRA section 313 requirements. In

addition to the requirements of Part XI. of this permit and other applicable conditions of this permit, storm water pollution prevention plans for facilities subject to reporting requirements under EPCRA Section 313 for chemicals that are classified as "Section 313 water priority chemicals" in accordance with the definition in Part X. of this permit shall describe and ensure the implementation of practices that are necessary to provide for conformance with the following guidelines:

a. In areas where Section 313 water priority chemicals are stored, processed or otherwise handled, appropriate containment, drainage control and/or diversionary structures shall be provided. At a minimum, one of the following preventive systems or its equivalent shall be used:

(1) Curbing, culverting, gutters, sewers, or other forms of drainage control to prevent or minimize the potential for storm water runoff to come into contact with significant sources of pollutants; or

(2) Roofs, covers or other forms of appropriate protection to prevent storage piles from exposure to storm water and wind.

b. In addition to the minimum standards listed under Part IV.E.1.a. (above) of this permit, the storm water pollution prevention plan shall include a complete discussion of measures taken to conform with the following applicable guidelines, other effective storm water pollution prevention procedures, and applicable State rules, regulations, and guidelines:

(1) *Liquid storage areas where storm water comes into contact with any equipment, tank, container, or other vessel used for section 313 water priority chemicals*—(a) No tank or container shall be used for the storage of a Section 313 water priority chemical unless its material and construction are compatible with the material stored and conditions of storage such as pressure and temperature, etc.

(b) Liquid storage areas for Section 313 water priority chemicals shall be operated to minimize discharges of Section 313 chemicals. Appropriate measures to minimize discharges of Section 313 chemicals may include secondary containment provided for at least the entire contents of the largest single tank plus sufficient freeboard to allow for precipitation, a strong spill contingency and integrity testing plan, and/or other equivalent measures.

(2) *Material storage areas for section 313 water priority chemicals other than liquids*. Material storage areas for Section 313 water priority chemicals other than liquids that are subject to

runoff, leaching, or wind shall incorporate drainage or other control features that will minimize the discharge of Section 313 water priority chemicals by reducing storm water contact with Section 313 water priority chemicals.

(3) *Truck and rail car loading and unloading areas for liquid section 313 water priority chemicals*. Truck and rail car loading and unloading areas for liquid Section 313 water priority chemicals shall be operated to minimize discharges of Section 313 water priority chemicals. Protection such as overhangs or door skirts to enclose trailer ends at truck loading/unloading docks shall be provided as appropriate. Appropriate measures to minimize discharges of Section 313 chemicals may include: the placement and maintenance of drip pans (including the proper disposal of materials collected in the drip pans) where spillage may occur (such as hose connections, hose reels and filler nozzles) for use when making and breaking hose connections; a strong spill contingency and integrity testing plan; and/or other equivalent measures.

(4) *Areas where section 313 water priority chemicals are transferred, processed, or otherwise handled*. Processing equipment and materials handling equipment shall be operated so as to minimize discharges of Section 313 water priority chemicals. Materials used in piping and equipment shall be compatible with the substances handled. Drainage from process and materials handling areas shall minimize storm water contact with Section 313 water priority chemicals. Additional protection such as covers or guards to prevent exposure to wind, spraying or releases from pressure relief vents from causing a discharge of Section 313 water priority chemicals to the drainage system shall be provided as appropriate. Visual inspections or leak tests shall be provided for overhead piping conveying Section 313 water priority chemicals without secondary containment.

(5) *Discharges from areas covered by paragraphs (1), (2), (3), or (4)*—(a) Drainage from areas covered by paragraphs (1), (2), (3), or (4) of this part should be restrained by valves or other positive means to prevent the discharge of a spill or other excessive leakage of Section 313 water priority chemicals. Where containment units are employed, such units may be emptied by pumps or ejectors; however, these shall be manually activated.

(b) Flapper-type drain valves shall not be used to drain containment areas. Valves used for the drainage of containment areas should, as far as is

practical, be of manual, open-and-closed design.

(c) If facility drainage is not engineered as above, the final discharge of all in-facility storm sewers shall be equipped to be equivalent with a diversion system that could, in the event of an uncontrolled spill of Section 313 water priority chemicals, return the spilled material to the facility.

(d) Records shall be kept of the frequency and estimated volume (in gallons) of discharges from containment areas.

(6) *Facility site runoff other than from areas covered by (1), (2), (3), or (4)*.

Other areas of the facility (those not addressed in paragraphs (1), (2), (3), or (4)), from which runoff that may contain Section 313 water priority chemicals or spills of Section 313 water priority chemicals could cause a discharge shall incorporate the necessary drainage or other control features to prevent discharge of spilled or improperly disposed material and ensure the mitigation of pollutants in runoff or leachate.

(7) *Preventive maintenance and housekeeping*. All areas of the facility shall be inspected at specific intervals identified in the plan for leaks or conditions that could lead to discharges of Section 313 water priority chemicals or direct contact of storm water with raw materials, intermediate materials, waste materials or products. In particular, facility piping, pumps, storage tanks and bins, pressure vessels, process and material handling equipment, and material bulk storage areas shall be examined for any conditions or failures that could cause a discharge. Inspection shall include examination for leaks, wind blowing, corrosion, support or foundation failure, or other forms of deterioration or noncontainment. Inspection intervals shall be specified in the plan and shall be based on design and operational experience. Different areas may require different inspection intervals. Where a leak or other condition is discovered that may result in significant releases of Section 313 water priority chemicals to waters of the United States, action to stop the leak or otherwise prevent the significant release of Section 313 water priority chemicals to waters of the United States shall be immediately taken or the unit or process shut down until such action can be taken. When a leak or noncontainment of a Section 313 water priority chemical has occurred, contaminated soil, debris, or other material must be promptly removed and disposed in accordance with Federal, State, and local requirements and as described in the plan.

(8) *Facility security.* Facilities shall have the necessary security systems to prevent accidental or intentional entry that could cause a discharge. Security systems described in the plan shall address fencing, lighting, vehicular traffic control, and securing of equipment and buildings.

(9) *Training.* Facility employees and contractor personnel that work in areas where Section 313 water priority chemicals are used or stored shall be trained in and informed of preventive measures at the facility. Employee training shall be conducted at intervals specified in the plan, but not less than once per year, in matters of pollution control laws and regulations, and in the storm water pollution prevention plan and the particular features of the facility and its operation that are designed to minimize discharges of Section 313 water priority chemicals. The plan shall designate a person who is accountable for spill prevention at the facility and who will set up the necessary spill emergency procedures and reporting requirements so that spills and emergency releases of Section 313 water priority chemicals can be isolated and contained before a discharge of a Section 313 water priority chemical can occur. Contractor or temporary personnel shall be informed of facility operation and design features in order to prevent discharges or spills from occurring.

(10) *Engineering certification.* The storm water pollution prevention plan for a facility subject to EPCRA Section 313 requirements for chemicals that are classified as Section 313 water priority chemicals shall be reviewed and certified by a Registered Professional Engineer. The Registered Professional Engineer authorized to conduct the certification shall recertify the plan every 3 years thereafter or as soon as practicable after significant modifications are made to the facility. By means of these certifications, the Registered Professional Engineer, having examined the facility and being familiar with the provisions of this part, shall attest that the storm water pollution prevention plan has been prepared in accordance with good engineering practices. Such certifications shall in no way relieve the owner or operator of a facility covered by the plan of their duty to prepare and fully implement such plan.

3. *Additional requirements for salt storage.* Storage piles of salt used for deicing or other commercial or industrial purposes and that generate a storm water discharge associated with industrial activity that is discharged to waters of the United States shall be

enclosed or covered to prevent exposure to precipitation, except for exposure resulting from adding or removing materials from the pile. Dischargers shall demonstrate compliance with this provision as expeditiously as practicable, but in no event later than [insert date 3 years after permit finalization]. Piles do not need to be enclosed or covered where storm water from the pile is not discharged to waters of the United States.

4. *Consistency with other plans.* Storm water pollution prevention plans may reference the existence of other plans for Spill Prevention Control and Countermeasure (SPCC) plans developed for the facility under Section 311 of the CWA or Best Management Practices (BMP) Programs otherwise required by an NPDES permit for the facility as long as such requirement is incorporated into the storm water pollution prevention plan.

V. Numeric Effluent Limitations

A. Discharges Associated With Specific Industrial Activity

Numeric effluent limitations for storm water discharges associated with a specific industrial activity are described in Part XI. of this permit.

B. Coal Pile Runoff

Any discharge composed of coal pile runoff shall not exceed a maximum concentration for any time of 50 mg/L total suspended solids. Coal pile runoff shall not be diluted with storm water or other flows in order to meet this limitation. The pH of such discharges shall be within the range of 6.0 to 9.0. Runoff from coal piles located at steam electric generating facilities shall be in compliance with these limits upon submittal of the Notice of Intent (NOI). Runoff from coal piles at all other types of facilities shall comply with these limitations as expeditiously as practicable, but in no case later than [insert date 3 years after permit finalization]. Any untreated overflow from facilities designed, constructed and operated to treat the volume of coal pile runoff that is associated with a 10-year, 24-hour rainfall event shall not be subject to the 50 mg/L limitation for total suspended solids.

VI. Monitoring and Reporting Requirements

A. Monitoring Requirements

1. *Limitations on Monitoring Requirements*—a. Except as required by paragraph b., only those facilities with discharges or activities identified in Part VI.C. and Part XI. are required to conduct sampling of their storm water

discharges associated with industrial activity. Monitoring requirements under parts VI.C. and XI. are additive. Facilities with discharges or activities described in more than one monitoring section are subject to all applicable monitoring requirements.

b. The Director can provide written notice to any facility otherwise exempt from the sampling requirements of Parts VI.C. and XI. that it shall conduct discharge sampling for a specific monitoring frequency for specific parameters.

B. Reporting: Where to Submit

1. *Location.* Signed copies of discharge monitoring reports required under Parts XI. and VI.C., individual permit applications, and all other reports required herein, shall be submitted to the Director of the NPDES program at the address of the appropriate Regional Office:

a. *CT, MA, ME, NH, RI, VT, EPA,* Region I, Water Management Division, (WCP-2109), Storm Water Staff, John F. Kennedy Federal Building, Room 2209, Boston, MA 02203.

b. *NJ, NY, PR, VI, EPA,* Region II, Water Management Division, (2WM-WPC), Storm Water Staff, 26 Federal Plaza, New York, NY 10278.

c. *DE, DC, MD, PA, VA, WV, EPA,* Region III, Water Management Division, (3WM55), Storm Water Staff, 841 Chestnut Building, Philadelphia, PA 19107.

d. *FL and Indian Lands in AL, FL, MS, and NC, EPA,* Region IV, Water Management Division, Permits Section (WPEB-7), 345 Courtland Street, NE, Atlanta, GA 30365.

e. *AR, LA, NM (except see Region IX for Navajo lands, and see Region VIII for Ute Mountain Reservation lands), OK, TX, EPA,* Region VI, Water Management Division, (6W-EA), Storm Water Staff, First Interstate Bank Tower at Fountain Place, 1445 Ross Avenue, 12th Floor, Suite 1200, Dallas, TX 75202.

f. *CO, MT, ND, SD, WY, UT (except see Region IX for Goshute Reservation and Navajo Reservation lands) and Portions of Pine Ridge Reservation in Nebraska, EPA,* Region VIII, NPDES Branch (8WM-C), 999 18th Street, Suite 500, Denver, CO 80202-2466.

Note—For Montana Indian Lands, please use the following address: EPA, Region VIII, Montana Operations Office, Federal Office Building, Drawer 10096, 301 South Park, Helena, MT 59620-0026.

g. *AZ, CA, HI, NV, Guam, American Samoa, the Goshute Reservation in UT and NV, the Navajo Reservation in UT, NM, and AZ, the Duck Valley Reservation in NV and ID, EPA,* Region

IX, Water Management Division, (W-5-1), Storm Water Staff, 75 Hawthorne Street, San Francisco, CA 94105.

h. AK, ID (except see Region IX for Duck Valley Reservation lands), OR (except see Region IX for Fort McDermitt Reservation lands), WA, EPA, Region X, Water Division, (WD-134), Storm Water Staff, 1200 Sixth Avenue, Seattle, WA 98101.

2. Additional notification. In addition to filing copies of discharge monitoring reports in accordance with Part VI.B. (Reporting: Where to Submit), facilities with at least one storm water discharge associated with industrial activity through a large or medium municipal separate storm sewer system (systems serving a population of 100,000 or more) or a municipal system designated by the Director must submit signed copies of discharge monitoring reports to the operator of the municipal separate storm sewer system in accordance with the dates provided in Part XI. Facilities not required to report monitoring data under Part XI. and facilities that are not otherwise required to monitor their discharges, need not comply with this provision.

C. Special Monitoring Requirements

During the period beginning on the effective date and lasting through the expiration date of this permit, permittees with facilities and activities identified in Parts VI.C.1. (below) must monitor those storm water discharges identified below at least annually (1 time per year). Permittees with facilities identified in Parts VI.C.1. (below) must report in accordance with Part VI.B. (Reporting: Where to Submit). In addition to the parameters listed below, the permittee shall provide the date and duration (in hours) of the storm event(s) samples: rainfall measurements or estimates (in inches) of the storm event that generated the sampled runoff; the duration between the storm event samples and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge samples.

1. Coal pile runoff. In addition to any monitoring required by Part XI., facilities with coal piles exposed to storm water shall monitor such storm water for: pH and TSS (mg/L).

2. Sample type. For discharges from holding ponds or other impoundments with a retention period greater than 24 hours (estimated by dividing the volume of the detention pond by the estimated volume of water discharged during the 24 hours previous to the time that the sample is collected), a minimum of one grab sample may be taken. For all other

discharges, data shall be reported for a grab sample. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable.

3. Sampling waiver. When a discharger is unable to collect samples due to adverse climatic conditions, the discharger must submit in lieu of sampling data a description of why samples could not be collected, including available documentation of the event. Adverse weather conditions that may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.). Dischargers are precluded from exercising this waiver more than once during a 2-year period.

4. Representative discharge. When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, and the permittee reasonably believes substantially identical effluents are discharged, the permittee may test the effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfalls provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area (e.g., low (under 40 percent), medium (40 to 65 percent) or high (above 65 percent)) shall be provided in the plan. Permittees required to submit monitoring information under Part VIII. of this permit shall include the description of the location of the outfalls, explanation of why outfalls are expected to

discharge substantially identical effluents, and estimate of the size of the drainage area and runoff coefficient with the Discharge Monitoring Report. Permittees who received approval from the Environmental Protection Agency of a substantially identical outfall petition prior to submitting their application may submit a copy of the petition and the letter from the Permits Division of the NPDES Program Branch in lieu of the above information.

5. Alternative certification. A discharger is not subject to the monitoring requirements of Part VI. of this permit provided the discharger makes a certification for a given outfall, on an annual basis, under penalty of law, signed in accordance with Part VII.G. (Signatory Requirements), that coal piles that are located in areas of the facility that are within the drainage area of the outfall are not presently exposed to storm water and are not expected to be exposed to storm water for the certification period. Such certification must be retained in the storm water pollution prevention plan, and submitted to EPA in accordance with Part VI.B. of this permit.

6. When to submit. Permittees subject to monitoring requirements under Part VI.A. shall submit monitoring results annually no later than the 28th day of [insert month following permit finalization].

VII. Standard Permit Conditions

A. Duty to Comply

1. Permittee's duty to comply. The permittee must comply with all conditions of this permit. Any permit noncompliance constitutes a violation of Clear Water Act and is grounds for enforcement action; for permit termination, revocation and reissuance, or modification; or for denial of a permit renewal application.

2. Penalties for violations of permit conditions a. Criminal—(1) Negligent violations. The CWA provides that any person who negligently violates permit conditions implementing Sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to a fine of not less than \$2,500 nor more than \$25,000 per day of violation, or by imprisonment for not more than 1 year, or both.

(2) Knowing violations. The CWA provides that any person who knowingly violates permit conditions implementing Sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to a fine of not less than \$5,000 nor more than \$50,000 per day of violation, or by imprisonment for not more than 3 years, or both.

(3) *Knowing endangerment.* The CWA provides that any person who knowingly violates permit conditions implementing Sections 301, 302, 306, 307, 308, 318, or 405 of the Act and who knows at that time that he is placing another person in imminent danger of death or serious bodily injury is subject to a fine of not more than \$250,000, or by imprisonment for not more than 15 years, or both.

(4) *False statement.* The CWA provides that any person who knowingly makes any false material statement, representation, or certification in any application, record, report, plan, or other document filed or required to be maintained under the Act or who knowingly falsifies, tampers with, or renders inaccurate, any monitoring device or method required to be maintained under the Act, shall upon conviction, be punished by a fine of not more than \$10,000 or by imprisonment for not more than 2 years, or by both. If a conviction is for a violation committed after a first conviction of such person under this paragraph, punishment shall be by a fine of not more than \$20,000 per day of violation, or by imprisonment of not more than 4 years, or by both. (See Section 309(c)(4) of the Clean Water Act).

b. Civil penalties. The CWA provides that any person who violates a permit condition implementing Sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to a civil penalty not to exceed \$25,000 per day for each violation.

c. Administrative penalties. The CWA provides that any person who violates a permit condition implementing Sections 301, 302, 306, 307, 308, 318, or 405 of the Act is subject to an administrative penalty, as follows:

(1) *Class I penalty.* Not to exceed \$10,000 per violation nor shall the maximum amount exceed \$25,000.

(2) *Class II penalty.* Not to exceed \$10,000 per day for each day during which the violation continues nor shall the maximum amount exceed \$125,000.

B. Continuation of the Expired General Permit

This permit expires on [insert date 5 years after permit finalization]. However, an expired general permit continues in force and effect until a new general permit is issued. Permittees that choose or are required, to obtain an individual permit must submit an application (Forms 1 and 2F and any other applicable forms) 180 days prior to expiration of this permit. Permittees that are eligible and choose to be covered by a new general permit must

submit an NOI by the date specified in that permit.

C. Need to Halt or Reduce Activity Not a Defense

It shall not be a defense for a permittee in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this permit.

D. Duty to Mitigate

The permittee shall take all reasonable steps to minimize or prevent any discharge in violation of this permit that has a reasonable likelihood of adversely affecting human health or the environment.

E. Duty to Provide Information

The permittee shall furnish to the Director, within a time specified by the Director, any information that the Director may request to determine compliance with this permit. The permittee shall also furnish to the Director upon request copies of records required to be kept by this permit.

F. Other Information

When the permittee becomes aware that he or she failed to submit any relevant facts or submitted incorrect information in the NOI or in any other report to the Director, he or she shall promptly submit such facts or information.

G. Signatory Requirements

All Notices of Intent, Notices of Termination, storm water pollution prevention plans, reports, certifications or information either submitted to the Director (and/or the operator of a large or medium municipal separate storm sewer system), or that this permit requires be maintained by the permittee, shall be signed.

1. *Signature.* All reports required by the permit and other information requested by the Director shall be signed as follows:

a. For a corporation: by a responsible corporate officer. For the purpose of this section, a responsible corporate officer means: (1) a president, secretary, treasurer, or vice-president of the corporation in charge of a principal business function, or any other person who performs similar policy or decision-making functions for the corporation; or (2) the manager of one or more manufacturing, production or operating facilities employing more than 250 persons or having gross annual sales or expenditures exceeding \$25,000,000 (in second-quarter 1980 dollars) if authority to sign documents has been

assigned or delegated to the manager in accordance with corporate procedures;

b. For a partnership or sole proprietorship: by a general partner or the proprietor, respectively; or

c. For a municipality: State, Federal, or other public facility: by either a principal executive officer or ranking elected official. For purposes of this section, a principal executive officer of a Federal agency includes (1) the chief executive officer of the agency, or (2) a senior executive officer having responsibility for the overall operations of a principal geographic unit of the agency (e.g., Regional Administrators of EPA).

2. *Authorized representative.* All reports required by the permit and other information requested by the Director shall be signed by a person described in Section VII.G.1. above or be signed by a duly authorized representative of that person. A person is a duly authorized representative only if:

a. The authorization is made in writing by a person described above and submitted to the Director.

b. The authorization specifies either an individual or a position having responsibility for the overall operation of the regulated facility or activity, such as the position of manager, operator, superintendent, or position of equivalent responsibility or an individual or position having overall responsibility for environmental matters for the company. (A duly authorized representative may thus be either a named individual or any individual occupying a named position).

c. *Changes to authorization.* If an authorization under paragraph VII.G.2. is no longer accurate because a different individual or position has responsibility for the overall operation of the facility, a new NOI satisfying the requirements of paragraph II.B. (Contents of NOI) must be submitted to the Director prior to or together with any reports, information, or applications to be signed by an authorized representative.

d. *Certification.* Any person signing documents under this section shall make the following certification:

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gathered and evaluated the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

H. Penalties for Falsification of Reports

Section 309(c)(4) of the Clean Water Act provides that any person who knowingly makes any false material statement, representation, or certification in any record or other document submitted or required to be maintained under this permit, including reports of compliance or noncompliance shall, upon conviction, be punished by a fine of not more than \$10,000, or by imprisonment for not more than 2 years, or by both.

I. Penalties for Falsification of Monitoring Systems

The CWA provides that any person who falsifies, tampers with, or knowingly renders inaccurate any monitoring device or method required to be maintained under this permit shall, upon conviction, be punished by fines and imprisonment described in Section 309 of the CWA.

J. Oil and Hazardous Substance Liability

Nothing in this permit shall be construed to preclude the institution of any legal action or relieve the permittee from any responsibilities, liabilities, or penalties to which the permittee is or may be subject under Section 311 of the CWA or Section 106 of the Comprehensive Environmental Response, Compensation and Liability Act of 1980 (CERCLA).

K. Property Rights

The issuance of this permit does not convey any property rights of any sort, nor any exclusive privileges, nor does it authorize any injury to private property nor any invasion of personal rights, nor any infringement of Federal, State, or local laws or regulations.

L. Severability

The provisions of this permit are severable, and if any provision of this permit, or the application of any provision of this permit to any circumstance, is held invalid, the application of such provision to other circumstances, and the remainder of this permit shall not be affected thereby.

M. Requiring an Individual Permit or an Alternative General Permit

1. Director designation. The Director may require any person authorized by this permit to apply for and/or obtain either an individual NPDES permit or an alternative NPDES general permit. Any interested person may petition the Director to take action under this paragraph. The Director may require any owner or operator authorized to discharge under this permit to apply for an individual NPDES permit only if the

owner or operator has been notified in writing that a permit application is required. This notice shall include a brief statement of the reasons for this decision, an application form, a statement setting a deadline for the owner or operator to file the application, and a statement that on the effective date of issuance or denial of the individual NPDES permit or the alternative general permit as it applies to the individual permittee, coverage under this general permit shall automatically terminate. Individual permit applications shall be submitted to the address of the appropriate Regional Office shown in Part VI.B. (Reporting: Where to Submit) of this permit. The Director may grant additional time to submit the application upon request of the applicant. If an owner or operator fails to submit in a timely manner an individual NPDES permit application as required by the Director, then the applicability of this permit to the individual NPDES permittee is automatically terminated at the end of the day specified for application submittal.

2. Individual permit application. Any owner or operator authorized by this permit may request to be excluded from the coverage of this permit by applying for an individual permit. The owner or operator shall submit an individual application (Form 1 and Form 2F) with reasons supporting the request to the Director. Individual permit applications shall be submitted to the address of the appropriate Regional Office shown in Part VI.B. of this permit. The request may be granted by the issuance of any individual permit or an alternative general permit if the reasons cited by the owner or operator are adequate to support the request.

3. Individual/alternative general permit issuance. When an individual NPDES permit is issued to an owner or operator otherwise subject to this permit, or the owner or operator is authorized for coverage under an alternative NPDES general permit, the applicability of this permit to the individual NPDES permittee is automatically terminated on the effective date of the individual permit or the date of authorization of coverage under the alternative general permit, whichever the case may be. When an individual NPDES permit is denied to an owner or operator otherwise subject to this permit, or the owner or operator is denied for coverage under an alternative NPDES general permit, the applicability of this permit to the individual NPDES permittee is automatically terminated on the date of

such denial, unless otherwise specified by the Director.

N. State/Environmental Laws

Nothing in this permit shall be construed to preclude the institution of any legal action or relieve the permittee from any responsibilities, liabilities, or penalties established pursuant to any applicable State law or regulation under authority preserved by Section 510 of the Act.

No condition of this permit shall release the permittee from any responsibility or requirements under other environmental statutes or regulations.

O. Proper Operation and Maintenance

The permittee shall at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) that are installed or used by the permittee to achieve compliance with the conditions of this permit and with the requirements of storm water pollution prevention plans. Proper operation and maintenance also includes adequate laboratory controls and appropriate quality assurance procedures. Proper operation and maintenance requires the operation of backup or auxiliary facilities or similar systems, installed by a permittee only when necessary to achieve compliance with the conditions of the permit.

P. Monitoring and Records

1. Representative samples/measurements. Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity.

2. Retention of records—*a.* The permittee shall retain the pollution prevention plan developed in accordance with Parts IV. and XI. of this permit until at least 1 year after coverage under this permit terminates. The permittee shall retain all records of all monitoring information, copies of all reports required by this permit, and records of all data used to complete the NOI to be covered by this permit, until at least 1 year after coverage under this permit terminates. This period may be explicitly modified by specific provisions of this permit or extended by request of the Director at any time.

b. For discharges subject to monitoring requirements pursuant to Parts VI. and XI. of this permit, in addition to the requirements of paragraph VII.P.2.a. (above), permittees are required to retain for a 6-year period from the date of sample collection or for the term of this permit, whichever is greater, records of all monitoring

information collected during the term of this permit. Permittees must submit such monitoring results to the Director upon request.

3. Records contents. Records of monitoring information shall include:

- a. The date, exact place, and time of sampling or measurements;
- b. The initials or name(s) of the individual(s) who performed the sampling or measurements;
- c. The date(s) analyses were performed;
- d. The time(s) analyses were initiated;
- e. The initials or name(s) of the individual(s) who performed the analyses;
- f. References and written procedures, when available, for the analytical techniques or methods used; and
- g. The results of such analyses, including the bench sheets, instrument readouts, computer disks or tapes, etc., used to determine these results.

4. Approved monitoring methods. Monitoring must be conducted according to test procedures approved under 40 CFR Part 136, unless other test procedures have been specified in this permit.

Q. Inspection and Entry

The permittee shall allow the Director or an authorized representative of EPA, the State environmental agency, or, in the case of a facility that discharges through a municipal separate storm sewer, an authorized representative of the municipal operator or the separate storm sewer receiving the discharge, upon the presentation of credentials and other documents as may be required by law, to: Enter upon the permittee's premises where a regulated facility or activity is located or conducted or where records must be kept under the conditions of this permit; have access to and copy at reasonable times, any records that must be kept under the conditions of this permit; and inspect at reasonable times any facilities or equipment (including monitoring and control equipment).

R. Permit Actions

This permit may be modified, revoked and reissued, or terminated for cause. The filing of a request by the permittee for a permit modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any permit condition.

S. Bypass of Treatment Facility

1. Notice—*a. Anticipated bypass.* If a permittee subject to the numeric effluent limitation of Parts V. and XI. of this permit knows in advance of the

need for a bypass, he or she shall submit prior notice, if possible, at least 10 days before the date of the bypass; including an evaluation of the anticipated quality and effect of the bypass.

b. Unanticipated bypass. The permittee subject to the numeric effluent limitation of Parts V. and XI. of this permit shall submit notice of an unanticipated bypass. Any information regarding the unanticipated bypass shall be provided orally within 24 hours from the time the permittee became aware of the circumstances. A written submission shall also be provided within 5 days of the time the permittee became aware of the circumstances. The written submission shall contain a description of the bypass and its cause; the period of the bypass; including exact dates and times, and if the bypass has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent reoccurrence of the bypass.

2. Prohibition of bypass—*a.* Bypass is prohibited and the Director may take enforcement action against a permittee for a bypass. Unless:

- (1) The bypass was unavoidable to prevent loss of life, personal injury, or severe property damage;
- (2) There were no feasible alternatives to the bypass, such as the use of auxiliary facilities, retention of untreated wastes, or maintenance during normal periods of equipment downtime. This condition is not satisfied if the permittee should, in the exercise of reasonable engineering judgement, have installed adequate backup equipment to prevent a bypass that occurred during normal periods of equipment downtime or preventive maintenance; and
- (3) The permittee submitted notices of the bypass.

b. The Director may approve an anticipated bypass after considering its adverse effects, if the Director determines that it will meet the three conditions listed in Part VII.S.2.a.

T. Upset Conditions

1. Affirmative defense. An upset constitutes an affirmative defense to an action brought for noncompliance with technology-based numeric effluent limitations in Parts V. and XI. of this permit if the requirements of paragraph 2 below are met. No determination made during administrative review of claims that noncompliance was caused by upset, and before an action for noncompliance, if final administrative action subject to judicial review.

2. Required defense. A permittee who wishes to establish the affirmative defense of an upset shall demonstrate,

through properly signed, contemporaneous operating logs, or other relevant evidence, that:

- a. An upset occurred and that the permittee can identify the specific cause(s) of the upset;
- b. The permitted facility was at the time being properly operated; and
- c. The permittee provided oral notice of the upset to EPA within 24 hours from the time the permittee became aware of the circumstances. A written submission shall also be provided within 5 days of the time the permittee became aware of the circumstances. The written submission shall contain a description of the upset and its cause; the period of the upset; including exact dates and times, and if the upset has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent reoccurrence of the upset.

3. Burden of proof. In any enforcement proceeding the permittee seeking to establish the occurrence of an upset has the burden of proof.

VIII. Reopener Clause

A. Potential or Realized Impacts on Water Quality

If there is evidence indicating potential or realized impacts on water quality due to any storm water discharge associated with industrial activity covered by this permit, the owner or operator of such discharge may be required to obtain an individual permit or an alternative general permit in accordance with Part VII.M. (Requiring an Individual Permit or Alternative General Permit) of this permit or the permit may be modified to include different limitations and/or requirements.

B. Applicable Regulations

Permit modification or revocation will be conducted according to 40 CFR 122.62, 122.63, 122.64, and 124.5.

IX. Termination of Coverage

A. Notice of Termination

Where all storm water discharges associated with industrial activity that are authorized by this permit are eliminated, or where the operator of storm water discharges associated with industrial activity at a facility changes, the operator of the facility may submit a Notice of Termination that is signed in accordance with Part VII.G. (Signatory Requirements) of this permit. The Notice of Termination shall include the following information:

- 1. Facility information.** Name, mailing address, and location of the facility for which the notification is submitted.

Where a street address for the site is not available, the location of the approximate center of the site must be described in terms of the latitude and longitude to the nearest 15 seconds, or the section, township and range to the nearest quarter section;

2. Operator information. The name, address, and telephone number of the operator addressed by the Notice of Termination;

3. Permit number. The NPDES permit number for the storm water discharge associated with industrial activity identified by the Notice of Termination;

4. Reason for termination. An indication of whether the storm water discharges associated with industrial activity have been eliminated or the operator of the discharges has changed; and

5. Certification. The following certification signed in accordance with Part VII.G. (Signatory Requirements) of this permit:

I certify under penalty of law that all storm water discharges associated with industrial activity from the identified facility that are authorized by an NPDES general permit have been eliminated or that I am no longer the operator of the industrial activity. I understand that by submitting this notice of termination, that I am no longer authorized to discharge storm water associated with industrial activity under this general permit, and that discharging pollutants in storm water associated with industrial activity to waters of the United States is unlawful under the Clean Water Act where the discharge is not authorized by an NPDES permit. I also understand that the submittal of this notice of termination does not release an operator from liability for any violations of this permit or the Clean Water Act.

B. Addresses

All Notices of Termination are to be sent, using the form provided by the Director (or a photocopy thereof),³ to the Director of the NPDES program in care of the address that will be provided in the final permit notice.

X. Definitions

Best Management Practices ("BMPs") means schedules of activities, prohibitions of practices, maintenance procedures, and other management practices to prevent or reduce the pollution of waters of the United States. BMPs also include treatment requirements, operating procedures, and practices to control facility site runoff, spillage or leaks, sludge or waste disposal, or drainage from raw material storage.

Bypass means the intentional diversion of waste streams from any portion of a treatment facility.

Coal pile runoff means the rainfall runoff from or through any coal storage pile.

Co-located industrial activity means when an industrial facility has industrial activities being conducted onsite that meet the description of industrial activities in another section of the permit, that industrial facility shall comply with all applicable monitoring and pollution prevention plan requirements of the other section in addition to its applicable requirements.

CWA means Clean Water Act (formerly referred to as the Federal Water Pollution Control Act or Federal Water Pollution Control Act Amendments of 1972).

Director means the Regional Administrator or an authorized representative.

Flow-weighted composite sample means a composite sample consisting of a mixture of aliquots collected at a constant time interval, where the volume of each aliquot is proportional to the flow rate of the discharge.

Landfill means an area of land or an excavation in which wastes are placed for permanent disposal, and that is not a land application unit, surface impoundment, injection well, or waste pile.

Land application unit means an area where wastes are applied onto or incorporated into the soil surface (excluding manure spreading operations) for treatment or disposal.

Large and medium municipal separate storm sewer system means all municipal separate storm sewers that are either:

(i) Located in an incorporated place (city) with a population of 100,000 or more as determined by the latest Decennial Census by the Bureau of Census (these cities are listed in Appendices F and G of 40 CFR Part 122); or

(ii) Located in the counties with unincorporated urbanized populations of 100,000 or more, except municipal separate storm sewers that are located in the incorporated places, townships or towns within such counties (these counties are listed in Appendices H and I of 40 CFR Part 122); or

(iii) Owned or operated by a municipality other than those described in paragraph (i) or (ii) and that are designated by the Director as part of the large or medium municipal separate storm sewer system.

NOT means notice of termination (see Part IX.A. of this permit.)

Point source means any discernible, confined, and discrete conveyance, including but not limited to, any pipe, ditch, channel, tunnel, conduit, well, discrete fissure, container, rolling stock, concentrated animal feeding operation, landfill leachate collection system, vessel or other floating craft from which pollutants are or may be discharges. This term does not include return flows from irrigated agriculture or agricultural storm water runoff.

Section 313 water priority chemical means a chemical or chemical categories that are: (1) are listed at 40 CFR 372.65 pursuant to Section 313 of the Emergency Planning and Community Right-to-Know Act (EPCRA) (also known as Title III of the Superfund Amendments and Reauthorization Act (SARA) of 1986); (2) are present at or above threshold levels at a facility subject to EPCRA Section 313 reporting requirements; and (3) that meet at least one of the following criteria: (i) are listed in Appendix D of 40 CFR Part 122 on either Table II (organic priority pollutants), Table III (certain metals, cyanides, and phenols) or Table V (certain toxic pollutants and hazardous substances); (ii) are listed as a hazardous substance pursuant to Section 311(b)(2)(A) of the CWA at 40 CFR 116.4; or (iii) are pollutants for which EPA has published acute or chronic water quality criteria. See Addendum A of this permit.

Significant materials includes, but is not limited to: raw materials; fuels; materials such as solvents, detergents, and plastic pellets; finished materials such as metallic products; raw materials used in food processing or production; hazardous substances designated under Section 101(14) of CERCLA; any chemical the facility is required to report pursuant to EPCRA Section 313; fertilizers; pesticides; and waste products such as ashes, slag and sludge that have the potential to be released with storm water discharges.

Significant spills includes, but is not limited to: releases of oil or hazardous substances in excess of reportable quantities under Section 311 of the Clean Water Act (see 40 CFR 110.10 and CFR 117.21) or Section 102 of CERCLA (see 40 CFR 302.4).

Storm water means storm water runoff, snow melt runoff, and surface runoff and drainage.

Storm water associated with industrial activity means the discharge from any conveyance that is used for collecting and conveying storm water and that is directly related to manufacturing, processing or raw materials storage areas at an industrial plant. The term does not include

³ A copy of the approved NOT form is provided in Addendum D of this notice.

discharges from facilities or activities excluded from the NPDES program. For the categories of industries identified in paragraphs (i) through (x) of this definition, the term includes, but is not limited to, storm water discharges from industrial plant yards; immediate access roads and rail lines used or traveled by carriers of raw materials, manufactured products, waste material, or by-products used or created by the facility; material handling sites; refuse sites; sites used for the application or disposal of process waste waters (as defined at 40 CFR Part 401); sites used for the storage and maintenance of material handling equipment; sites used for residual treatment, storage, or disposal; shipping and receiving areas; manufacturing buildings; storage areas (including tank farms) for raw materials, and intermediate and finished products; and areas where industrial activity has taken place in the past and significant materials remain and are exposed to storm water. For the categories of industries identified in paragraph (xi) of this definition, the term includes only storm water discharges from all areas (except access roads and rail lines) listed in the previous sentence where material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, or industrial machinery are exposed to storm water. For the purposes of this paragraph, material handling activities include the storage, loading and unloading, transportation, or conveyance of any raw material, intermediate product, finished product, by-product or waste product. The term excludes areas located on plant lands separate from the plant's industrial activities, such as office buildings and accompanying parking lots as long as the drainage from the excluded areas is not mixed with storm water drained from the above described areas. Industrial facilities (including industrial facilities that are Federally, State, or municipally owned or operated that meet the description of the facilities listed in this paragraphs (i) to (xi) of this definition) include those facilities designated under 122.26(a)(1)(v). The following categories of facilities are considered to be engaging in "industrial activity" for purposes of this subsection:

(i) Facilities subject to storm water effluent limitations guidelines, new source performance standards, or toxic pollutant effluent standards under 40 CFR Subchapter N (except facilities with toxic pollutant effluent standards that are exempted under category (xi) of this definition);

(ii) Facilities classified as Standard Industrial Classifications 24 (except 2434), 26 (except 265 and 267), 28 (except 283), 29, 311, 32 (except 323), 33, 3441, 373;

(iii) Facilities classified as Standard Industrial Classifications 10 through 14 (mineral industry) including active or inactive mining operations (except for areas of coal mining operations no longer meeting the definition of a reclamation area under 40 CFR 434.11(l) because the performance bond issued to the facility by the appropriate SMCRA authority has been released, or except for areas of noncoal mining operations that have been released from applicable State or Federal reclamation requirements after December 17, 1990) and oil and gas exploration, production, processing, or treatment operations, or transmission facilities that discharge storm water contaminated by contact with or that has come into contact with, any overburden, raw material, intermediate products, finished products, byproducts or waste products located on the site of such operations; inactive mining operations are mining sites that are not being actively mined, but that have an identifiable owner/operator;

(iv) Hazardous waste treatment, storage, or disposal facilities, including those that are operating under interim status or a permit under Subtitle C of RCRA;

(v) Landfills, land application sites, and open dumps that have received any industrial wastes (waste that is received from any of the facilities described under this subsection) including those that are subject to regulation under Subtitle D of RCRA;

(vi) Facilities involved in the recycling of materials, including metal scrapyards, battery reclaimers, salvage yards, and automobile junkyards, including but limited to those classified as Standard Industrial Classification 5015 and 5093;

(vii) Steam electric power generating facilities, including coal handling sites;

(viii) Transportation facilities classified as Standard Industrial Classifications 40, 41, 42 (except 4221-25), 43, 44, 45 and 5171 that have vehicle maintenance shops, equipment cleaning operations, or airport deicing operations. Only those portions of the facility that are either involved in vehicle maintenance (including vehicle rehabilitation, mechanical repairs, painting, fueling, and lubrication), equipment cleaning operations, airport deicing operations, or that are otherwise identified under paragraphs (i) to (vii) or (ix) to (xi) of this subsection are associated with industrial activity;

(ix) Treatment works treating domestic sewage or any other sewage sludge or wastewater treatment device or system, used in the storage treatment, recycling, and reclamation of municipal or domestic sewage, including land dedicated to the disposal of sewage sludge that are located within the confines of the facility, with a design flow of 1.0 mgd or more, or required to have an approved pretreatment program under 40 CFR Part 403. Not included are farm lands, domestic gardens or lands used for sludge management where sludge is beneficially reused and that are not physically located in the confines of the facility, or areas that are in compliance with 40 CFR Part 503;

(x) Construction activity including clearing, grading and excavation activities except: operations that result in the disturbance of less than 5 acres of total land area that are not part of a larger common plan of development or sale;

(xi) Facilities under Standard Industrial Classifications 20, 21, 22, 23, 2434, 25, 265, 267, 27, 283, 285, 30, 31 (except 311), 323, 34 (except 3441), 35, 36, 37 (except 373), 38, 39, 4221-25, (and that are not otherwise included within categories (i) to (x)).⁴

Time-weighted composite means a composite sample consisting of a mixture of equal volume aliquots collected at a constant time interval.

Upset means an exceptional incident in which there is unintentional and temporary noncompliance with the numeric effluent limitations of Parts V. and XI. of this permit because of factors beyond the reasonable control of the permittee. An upset does not include noncompliance to the extent caused by operational error, improperly designed treatment facilities, inadequate treatment facilities, lack of preventive maintenance, or careless or improper operation.

Waste pile means any noncontainerized accumulation of solid, nonflowing waste that is used for treatment or storage.

Waters of the United States means:

(a) All waters that are currently used, were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters that are subject to the ebb and flow of the tide;

(b) All interstate waters, including interstate "wetlands";

(c) All other waters such as interstate lakes, rivers, streams (including

⁴ On June 4, 1992, the United States Court of Appeals for the Ninth Circuit remanded the exclusion for manufacturing facilities in category (xi) that do not have materials or activities exposed to storm water to the EPA for further rulemaking. (Nos. 90-70671 and 91-70200.)

intermittent streams), mudflats, sandflats, wetlands, sloughs, prairie potholes, wet meadows, playa lakes, or natural ponds the use, degradation, or destruction of which would affect or could affect interstate or foreign commerce including any such waters:

- (1) That are or could be used by interstate or foreign travelers for recreational or other purposes;
 - (2) From which fish or shellfish are or could be taken and sold in interstate or foreign commerce; or
 - (3) That are used or could be used for industrial purposes by industries in interstate commerce;
 - (d) All impoundments of waters otherwise defined as waters of the United States under this definition;
 - (e) Tributaries of waters identified in paragraphs (a) through (d) of this definition;
 - (f) The territorial sea; and
 - (g) Wetlands adjacent to waters (other than waters that are themselves wetlands) identified in paragraphs (a) through (f) of this definition.
- Waste treatment systems, including treatment ponds or lagoons designed to meet the requirements of CWA are not waters of the United States.

XI. Specific Requirements for Industrial Activities

A. Storm Water Discharges Associated With Industrial Activity From Timber Products Facilities

1. *Discharges covered under this section.* The requirements listed under this section shall apply to storm water discharges from the following activities: establishments [generally classified under Standard Industrial Classification (SIC) Major Group 24] that are engaged in cutting timber and pulpwood, merchant sawmills, lath mills, shingle mills, cooperage stock mills, planing mills, and plywood and veneer mills engaged in producing lumber and wood basic materials; and establishments engaged in wood preserving or in manufacturing finished articles made entirely of wood or related materials, except for wood kitchen cabinet manufacturers classified under SIC Code 2434.

When an industrial facility, described by the above eligibility provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution

prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

If monitoring and pollution prevention plan requirements of another industrial activity section of this permit apply to co-located industrial activities at an industrial facility, the eligibility provisions of that industrial activity section shall not preclude the operator of the industrial facility from complying with the applicable monitoring and pollution prevention plan requirements of that section.

2. *Special Conditions—*a. *Prohibition of non-storm water discharges—*(1) Discharges of boiler blowdown and water treatment wastewaters, noncontact and contact cooling waters, wash down waters from treatment equipment, and storm water that has come in contact with areas where spraying of chemical formulations designed to provide surface protection, to waters of the United States, or through municipal separate storm sewer systems are not authorized by this permit. The operators of such discharges must obtain coverage under a separate NPDES discharge permit.

(2) The following non-storm water discharges may be authorized by this permit provided the non-storm water component of the discharge is in compliance with paragraph XI.A.3.a.(3)(g)(i) (Measures and Controls for Non-storm Water Discharges): discharges from the spray down of lumber and wood product storage yards where no chemical additives are used in the spray down waters and no chemicals are applied to the wood during storage.

3. *Storm water pollution prevention plan requirements—*a. *Contents of plan.* The plan shall include, at a minimum, the following items:

(1) *Pollution prevention team.* Each plan shall identify a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team that are responsible for developing the storm water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

(2) *Description of potential pollutant Sources.* Each plan shall provide a description of potential sources that may reasonably be expected to add significant amounts of pollutants to storm water discharges or that may result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. Each plan shall identify all activities and significant materials that may potentially be significant pollutant sources. Each plan shall include, at a minimum:

(a) *Drainage—*(i) A site map indicating an outline of the portions of the drainage area of each storm water outfall that are within the facility boundaries, each existing structural control measure to reduce pollutants in storm water runoff, surface water bodies, locations where significant materials are exposed to precipitation, locations where major spills or leaks identified under Part XI.A.3.a.(2)(c) (Spills and Leaks) of this permit have occurred, and the locations of the following activities where such activities are exposed to precipitation: fueling stations; vehicle and equipment maintenance and/or cleaning areas; loading/unloading areas; material handling areas; locations used for the treatment, storage, or disposal of wastes; liquid storage tanks; processing areas; treatment chemical storage areas; treated wood and residue storage areas; wet decking areas; dry decking areas; untreated wood and residue storage areas; and treatment equipment storage areas.

(ii) For each area of the facility that generates storm water discharges associated with industrial activity with a reasonable potential for containing significant amounts of pollutants, a prediction of the direction of flow, and an identification of the types of pollutants that are likely to be present in storm water discharges associated with industrial activity. Factors to consider include the toxicity of chemicals; quantity of chemicals used, produced or discharged; the likelihood of contact with storm water; and history of significant leaks or spills of toxic or hazardous pollutants. Flows with a significant potential for causing erosion shall be identified.

(b) *Inventory of exposed materials—*An inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such inventory shall include a narrative description of significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of 3 years prior to the date of the issuance

of this permit and the present; method and location of onsite storage or disposal; materials management practices employed to minimize contact of materials with storm water runoff between the time of 3 years prior to the date of the issuance of this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of any treatment the storm water receives. The inventory of exposed materials shall include, but shall not be limited to the significant materials stored exposed to storm water and material management practices employed that were listed for the facility in the approved group application. Where information is available, facilities that have used chlorophenolic, creosote, or chromium-copper-arsenic formulations for wood surface protection or wood preserving activities onsite in the past should identify in the inventory the following: Areas where contaminated soils, treatment equipment, and stored materials still remain and management practices employed to minimize the contact of these materials with storm water runoff.

(c) *Spills and leaks*—A list of significant spills and significant leaks of toxic or hazardous pollutants that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility after the date of 3 years prior to the effective date of this permit. Such list shall be updated as appropriate during the term of the permit.

(d) *Sampling Data*—A summary of existing discharge sampling data describing pollutants in storm water discharges from the facility, including a summary of sampling data collected during the term of this permit.

(e) *Risk identification and summary of potential pollutant sources*—A narrative description of the potential pollutant sources from the following activities: Loading and unloading operations; outdoor storage activities; outdoor manufacturing or processing activities; significant dust or particulate generating processes; and onsite waste disposal practices. The description shall specifically list any significant potential source of pollutants at the site and for each potential source, any specific pollutant or pollutant parameter (e.g., total suspended solids, biochemical oxygen demand, chemical oxygen demand, oil and grease, arsenic, copper, chromium, pentachlorophenol, other specific metals, toxicity, etc.) of concern shall be identified.

(3) *Measures and controls*. Each facility covered by this permit shall develop a description of storm water best management practices (BMPs) and controls appropriate for the facility, and the implementation of such controls. The appropriateness and priorities of controls in a plan shall reflect identified potential sources of pollutants at the facility. The description of storm water management controls shall address the following areas of the site: Log, lumber and other wood product storage areas; residue storage areas, loading and unloading areas; material handling areas; chemical storage areas; and equipment/vehicle maintenance, storage and repair areas. Facilities that surface protect and/or preserve wood products should address specific BMPs for wood surface protection and preserving activities. The pollution prevention plan should address the following minimum components, including a schedule for implementing such controls:

(a) *Good housekeeping*—Good housekeeping requires the maintenance of areas that may contribute pollutants to storm water discharges in a clean, orderly manner. Good housekeeping measures in storage areas, loading and unloading areas, and material handling areas should be designed to: (1) limit the discharge of wood debris; (2) minimize the leachate generated from decaying wood materials; and (3) minimize the generation of dust.

(b) *Preventive maintenance*—A preventive maintenance program shall involve timely inspection and maintenance of storm water management devices (e.g., cleaning oil/water separators, catch basins) as well as inspecting and testing facility equipment and systems to uncover conditions that could cause breakdowns or failures resulting in discharges of pollutants to surface waters, and ensuring appropriate maintenance of such equipment and systems. Periodic removal of debris from ditches, swales, diversions, containment basins, sediment ponds and infiltration measures should be performed to limit discharges of solids and to maintain the effectiveness of the controls.

(c) *Spill prevention and response procedures*—Areas where potential spills that can contribute pollutants to storm water discharges can occur, and their accompanying drainage points shall be identified clearly in the storm water pollution prevention plan. Where appropriate, specifying material handling procedures, storage requirements, and use of equipment such as diversion valves in the plan should be considered. Procedures for cleaning up spills shall be identified in

the plan and made available to the appropriate personnel. The necessary equipment to implement a clean up should be available to personnel. Response schedules should be developed to limit tracking of spilled materials to other areas of the site. Leaks or spills of wood surface protection or preservation chemicals shall be cleaned up immediately in accordance with applicable RCRA regulations at 40 CFR Part 264 and 40 CFR Part 265.

(d) *Inspections*—In addition to or as part of the comprehensive site evaluation required under paragraph XI.A.3.a.(4) of this section, qualified facility personnel shall be identified to inspect designated equipment and areas of the facility at appropriate intervals specified in the plan. Operators of facilities are required to conduct quarterly visual inspections of BMPs. The inspections shall include:

(1) An assessment of the integrity of storm water discharge diversions, conveyance systems, sediment control and collection systems, and containment structures;

(2) Visual inspection of sediment and erosion BMPs to determine if soil erosion has occurred; and

(3) Visual inspections of storage areas and other potential sources of pollution for evidence of actual or potential pollutant discharges of contaminated storm water.

Material handling, and unloading and loading areas should be inspected daily whenever industrial activities occur in those areas. Good housekeeping measures and/or spill response measures should be implemented as appropriate to minimize contact of significant materials with storm water discharges.

Inspections at processing areas, transport areas, and treated wood storage areas of facilities performing wood surface protection and preservation activities should be performed monthly to assess the usefulness of practices in minimizing drippage of treatment chemicals on unprotected soils and in areas that will come in contact with storm water discharges.

A set of tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections. Records of inspections shall be maintained.

(e) *Employee training*—Employee training programs shall inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise responsible for storm water management at all levels of responsibility of the components and goals of the storm

water pollution prevention plan.

Training should address topics such as spill response, good housekeeping and material management practices. A pollution prevention plan shall identify periodic dates for such training.

(f) *Recordkeeping and internal reporting procedures*—A description of incidents (such as spills, or other discharges), along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. Inspections and maintenance activities shall be documented and records of such activities shall be incorporated into the plan.

(g) *Non-storm water discharges*—(i) The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit. Such certification may not be feasible if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit that receives the discharge. In such cases, the source identification section of the storm water pollution plan shall indicate why the certification required by this part was not feasible, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with paragraph XI.A.3.a.(3)(g)(iii) (below).

(ii) Except for flows from fire fighting activities, sources of non-storm water listed in Part III.A.2.b. (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

(iii) *Failure to certify*—Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director by [Insert date 270 days after permit issuance] or, for facilities that

begin to discharge storm water associated with industrial activity after [Insert date of permit issuance], 180 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: The procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States that are not authorized by an NPDES permit are unlawful, and must be terminated.

(h) *Sediment and erosion control*—The plan shall identify areas that, due to topography, activities, or other factors, have a high potential for significant soil erosion, and identify structural, vegetative, and/or stabilization measures to be used to limit erosion. When developing the plan, the following areas of the site should be considered: Loading and unloading areas, access roads, material handling areas, storage areas, and any other areas where heavy equipment and vehicle use is prevalent. The following erosion and sediment controls shall be considered to minimize the discharge of sediments from the site: Stabilization measures such as seeding, mulching, contouring, porous pavement, paving and sodding and structural measures such as sediment traps and silt fences.

(i) *Management of runoff*—The plan shall contain a narrative consideration of the appropriateness of traditional storm water management practices (practices other than those that control the generation or source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. The plan shall provide that measures that the permittee determines to be reasonable and appropriate shall be implemented and maintained. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity [see paragraph XI.A.3.a.(2) of this section (Description of Potential Pollutant Sources)] shall be considered when determining reasonable and appropriate measures. Appropriate measures may include: Vegetative swales and practices, reuse of collected storm water (such as for a process or as an irrigation source), inlet controls (such as oil/water separators), snow management activities, infiltration

devices, and wet detention/retention devices.

(4) *Comprehensive site compliance evaluation*. Qualified personnel shall conduct site compliance evaluations at appropriate intervals specified in the plan, but in no case less than once a year. Such evaluations shall include the following:

(a) Areas contributing to a storm water discharge associated with industrial activity such as loading/unloading areas, material handling areas, locations used for the treatment, storage or disposal of wastes, liquid storage tanks, processing areas, treatment chemical storage areas, treated wood and residue storage areas, wet decking areas, dry decking areas, untreated wood and residue storage areas, and treatment equipment storage areas shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, and other structural pollution prevention measures identified in the plan shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the inspection, the description of potential pollutant sources identified in the plan in accordance with paragraph XI.A.3.a.(2) of this section (Description of Potential Pollutant Sources) and pollution prevention measures and controls identified in the plan in accordance with paragraph XI.A.3.a.(3) of this section (Measures and Controls) shall be revised as appropriate within 2 weeks of such inspection and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the inspection.

(c) A report summarizing the scope of the inspection, personnel making the inspection, the date(s) of the inspection, major observations relating to the implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph XI.A.3.a.(4)(b) (above) of the permit shall be made and retained as part of the storm water pollution prevention plan for at least 1 year after coverage under this permit terminates. The report shall identify any incidents of noncompliance. Where a report does not

identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) Where compliance evaluation schedules overlap with inspections required under 3.a.(3)(d), the compliance evaluation may be conducted in place of one such inspection.

4. *Numeric effluent limitations*—There are no additional numeric effluent limitations beyond those described in Part V. of this permit.

5. *Monitoring and reporting requirements*—a. *Analytical monitoring requirements*. During the period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] and the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance], permittees with facilities engaged in wood preservation and/or surface protection must monitor their storm water discharges associated with industrial activity at least quarterly (4 times per year) except as provided in paragraphs 5.a.(3) (Sampling Waiver), 5.a.(4) (Representative Discharge), and 5.a.(5) (Alternative Certification).

Facilities engaged in wood preservation and/or surface protection are required to monitor their storm water discharges for the pollutants of concern listed in Table A-1 below. Facilities currently using chlorophenolic formulations for wood preservation or surface protection, or that have used chlorophenolic formulations in the past, shall monitor storm water discharges for the parameters of concern listed in Table A-2 in addition to the parameters listed in Table A-1. Facilities that use copper-chromium-arsenic formulations for the preservation of wood shall monitor discharges for the presence of the pollutants of concern listed in Table A-3 in addition to the pollutants in Table A-1. Facilities must report in accordance with 5.b. (Reporting). In addition to the parameters listed in Tables A-1, A-2, and A-3 below, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event that generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

TABLE A-1.—MONITORING REQUIREMENTS

| Pollutants of concern | Monitoring cut-off concentration(mg/L) |
|---------------------------------|--|
| Chemical Oxygen Demand | 65.0 |
| Total Suspended Solids | 100.0 |
| Biochemical Oxygen Demand | 9.0 |

TABLE A-2.—ADDITIONAL MONITORING FOR FACILITIES PERFORMING WOOD PRESERVATION WITH CHLOROPHENOLIC FORMULATIONS

| Pollutant of concern | Monitoring cut-off concentration |
|------------------------|----------------------------------|
| Pentachlorophenol | Detection Limit. |

TABLE A-3.—ADDITIONAL MONITORING FOR FACILITIES PERFORMING WOOD PRESERVATION WITH CHROMIUM-COPPER-ARSENIC FORMULATIONS

| Pollutants of concern | Monitoring cut-off concentration (mg/L) |
|---------------------------------|---|
| Total Recoverable Arsenic | 0.000018 |
| Total Recoverable Copper | 0.009 |

(1) *Monitoring periods*. Facilities engaged in wood preservation and/or surface protection shall monitor samples collected during the sampling periods of: January to March, April to June, July to September, and October to December for the years specified in paragraph a. (above).

(2) *Sample type*. A minimum of one grab sample shall be taken. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable. If storm water discharges associated with industrial activity commingle with process or nonprocess water, then where practicable permittees must attempt to sample the storm water discharge before it mixes with the non-storm water discharge.

(3) *Sampling waiver*—(a) *Adverse conditions*—When a discharger is unable to collect samples during one of the monitoring periods specified in paragraph 5.a.(1) (Monitoring Periods) because of adverse climatic conditions, the discharger may collect two samples from the two separate qualifying events in the next monitoring period and submit this data. Adverse weather conditions that may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(b) *Low concentration waiver*—When the average concentration for a pollutant calculated from all monitoring data collected from an outfall during the monitoring period [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] is less than the corresponding value for that pollutant listed in Tables A-1, A-2, or A-3 under the column Monitoring Cut-off Concentration, a facility may waive monitoring and reporting requirements in the monitoring period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance]. The facility must submit to the Director, in lieu of the monitoring data, a certification that there has not been a significant change in industrial activity or the pollution prevention measures in area of the facility that drains to the outfall for which sampling was waived.

(4) *Representative discharge*. When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may test the effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be

provided in the plan. The permittee shall include the description of the location of the outfalls, explanation of why outfalls are expected to discharge substantially identical effluents, and estimate of the size of the drainage area and runoff coefficient with the Discharge Monitoring Report.

(5) *Alternative certification.* A discharger is not subject to the monitoring requirements of this section provided the discharger makes a certification for a given outfall, on an annual basis, under penalty of law, signed in accordance with Part VII.G. (Signatory Requirements), that material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, industrial machinery or operations, or significant materials from past industrial activity that are located in areas of the facility within the drainage area of the outfall are not presently exposed to storm water and are not expected to be exposed to storm water for the certification period. Such certification must be retained in the storm water pollution prevention plan, and submitted to EPA in accordance with Part VI.C. of this permit.

b. *Reporting.* Permittees with facilities engaged in wood preservation and/or surface protection shall submit monitoring results for each outfall associated with industrial activity [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the reporting period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March [insert the date 2 years after permit issuance]. Monitoring results [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance] shall be submitted on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March. A separate Discharge Monitoring Report Form is required for each quarterly sampling period. Signed copies of Discharge Monitoring Reports, or said certifications, shall be submitted to the Director of the NPDES program at the address of the appropriate Regional Office listed in Part VI.G. of the fact sheet to this permit.

(1) *Additional notification.* In addition to filing copies of discharge monitoring reports in accordance with paragraph b (above), facilities engaged in wood preservation and/or surface

protection with at least one storm water discharge associated with industrial activity through a large or medium municipal separate storm sewer system (systems serving a population of 100,000 or more) must submit signed copies of discharge monitoring reports to the operator of the municipal separate storm sewer system in accordance with the dates provided in paragraph b (above).

c. *Monthly visual examination of storm water quality.* All timber products facilities shall perform and document a visual examination of a representative storm water discharge associated with industrial activity exposed to storm water. The examination must be made at least once in each month during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(1) Examinations shall be made of samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 1 hour) of when the runoff or snowmelt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The inspection must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Where practicable, the same individual should carry out the collection and examination of discharges for entire permit term.

(2) Visual observation reports must be maintained onsite in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

(3) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such

outfalls and report that the observation data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

(4) When a discharger is unable to collect samples over the course of the monitoring period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions that may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

B. Storm Water Discharges Associated With Industrial Activity From Paper and Allied Products Manufacturing Facilities

1. *Discharges covered under this section.* The requirements listed under this section shall apply to storm water discharges from the following activities: Facilities engaged in the manufacture of pulps from wood and other cellulose fibers and from rags; the manufacture of paper and paperboard into converted products, such as paper coated off the paper machine, paper bags, paper boxes and envelopes; and establishments primarily engaged in manufacturing bags of plastic film and sheet. These facilities are commonly identified by Standard Industrial Classification (SIC) Major Group 26.

When an industrial facility, described by the above eligibility provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located

industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

If monitoring and pollution prevention plan requirements of another industrial activity section of this permit apply to co-located industrial activities at an industrial facility, the eligibility provisions of that industrial activity section shall not preclude the operator of the industrial facility from complying with the applicable monitoring and pollution prevention plan requirements of that section.

2. *Special Conditions*—a. *Prohibition of Non-storm Water Discharges*. There are no additional requirements beyond those in Part III.A. of this permit.

3. *Storm water pollution prevention plan requirements*—a. *Contents of plan*. The plan shall include, at a minimum, the following items:

1. *Pollution prevention team*. Each plan shall identify a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team that are responsible for developing the storm water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

(2) *Description of potential pollutant sources*. Each plan shall provide a description of potential sources that may reasonably be expected to add significant amounts of pollutants to storm water discharges or that may result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. Each plan shall identify all activities and significant materials that may potentially be significant pollutant sources. Each plan shall include, at a minimum:

(a) *Drainage*—(i) A site map indicating an outline of the portions of the drainage area of each storm water outfall that are within the facility boundaries, each existing structural control measure to reduce pollutants in storm water runoff, surface water bodies, locations where significant materials are exposed to precipitation, locations where major spills or leaks identified under Part XI.B.3.a.(2)(c) (Spills and Leaks) of this permit have occurred, and the locations of the following activities where such activities are exposed to precipitation: fueling stations, vehicle and equipment

maintenance and/or cleaning areas, loading/unloading areas, locations used for the treatment, storage or disposal of wastes and wastewaters, locations used for the treatment, filtration, or storage of water supplies, liquid storage tanks, processing areas, and storage areas.

(ii) For each area of the facility that generates storm water discharges associated with industrial activity with a reasonable potential for containing significant amounts of pollutants, a prediction of the direction of flow, and an identification of the types of pollutants that are likely to be present in storm water discharges associated with industrial activity. Factors to consider include the toxicity of chemical; quantity of chemicals used, produced or discharged; the likelihood of contact with storm water; and history of significant leaks or spills of toxic or hazardous pollutants. Flows with a significant potential for causing erosion shall be identified.

(b) *Inventory of exposed materials*—An inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such inventory shall include a narrative description of significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of 3 years prior to the date of the issuance of this permit and the present; method and location of onsite storage or disposal; materials management practices employed to minimize contact of materials with storm water runoff between the time of 3 years prior to the date of the issuance of this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of any treatment the storm water receives. The inventory of exposed materials shall include, but shall not be limited to the significant materials stored exposed to storm water and material management practices employed that were listed for the facility in the approved group application.

(c) *Spills and leaks*—A list of significant spills and significant leaks of toxic or hazardous pollutants that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility after the date of 3 years prior to the effective date of this permit. Such list shall be updated as appropriate during the term of the permit.

(d) *Sampling data*—A summary of existing discharge sampling data describing pollutants in storm water discharges from the facility, including a

summary of sampling data collected during the term of this permit.

(e) *Risk identification and summary of potential pollutant sources*—A narrative description of the potential pollutant sources from the following activities: loading and unloading operations; outdoor storage activities; outdoor manufacturing or processing activities; significant dust or particulate generating processes; and onsite waste disposal practices, and wastewater treatment activities to include sludge drying, storage, application or disposal activities. The description shall specifically list any significant potential source of pollutants at the site and for each potential source, any pollutant or pollutant parameter (e.g., biochemical oxygen demand, etc.) of concern shall be identified.

(3) *Measures and controls*. Each facility covered by this permit shall develop a description of storm water management controls appropriate for the facility, and implement such controls. The appropriateness and priorities of controls in a plan shall reflect identified potential sources of pollutants at the facility. The description of storm water management controls shall address the following minimum components, including a schedule for implementing such controls:

(a) *Good housekeeping*—Good housekeeping requires the maintenance of areas that may contribute pollutants to storm water discharges in a clean, orderly manner. The plan shall describe procedures performed to minimize contact of materials with storm water runoff. Examples include cleaning of lots and roofs that collect debris; routine cleaning of wastewater treatment, and other waste disposal (such as sludge handling) locations.

(b) *Preventive maintenance*—A preventive maintenance program shall involve timely inspection and maintenance of storm water management devices (e.g., cleaning oil/water separators, catch basins) as well as inspecting and testing facility equipment and systems to uncover conditions that could cause breakdowns or failures resulting in discharges of pollutants to surface waters, and ensuring appropriate maintenance of such equipment and systems.

(c) *Spill prevention and response procedures*—Areas where potential spills that can contribute pollutants to storm water discharges can occur, and their accompanying drainage points shall be identified clearly in the storm water pollution prevention plan. Where appropriate, specifying material handling procedures, storage

requirements, and use of equipment such as diversion valves in the plan should be considered. Procedures for cleaning up spills shall be identified in the plan and made available to the appropriate personnel. The necessary equipment to implement a cleanup should be available to personnel.

(d) *Inspections*—Qualified facility personnel shall be identified to inspect designated equipment and areas of the facility at appropriate intervals specified in the plan. A set of tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections. Records of inspections shall be maintained.

(e) *Employee training*—Employee training programs shall inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise responsible for storm water management at all levels of responsibility of the components and goals of the storm water pollution prevention plan. Training should address topics such as spill response, good housekeeping and material management practices. A pollution prevention plan shall identify periodic dates for such training.

(f) *Recordkeeping and internal reporting procedures*—A description of incidents (such as spills, or other discharges), along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. Inspections and maintenance activities shall be documented and records of such activities shall be incorporated into the plan.

(g) *Non-storm water discharges*—(i) The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit. Such certification may not be feasible if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit that receives the discharge. In such cases, the source identification section of the storm water pollution plan shall indicate why the certification required by this part was not feasible, along with

the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with paragraph (iii) (below).

(ii) Except for flows from fire fighting activities, sources of non-storm water listed in Part III.A. of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

(iii) *Failure to certify*—Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director by [Insert date 270 days after permit issuance] or, for facilities that begin to discharge storm water associated with industrial activity after [Insert date of permit issuance], 270 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: the procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States that are not authorized by an NPDES permit are unlawful, and must be terminated.

(h) *Sediment and erosion control*—The plan shall identify areas that, due to topography, activities, or other factors, have a high potential for significant soil erosion, and identify structural, vegetative, and/or stabilization measures to be used to limit erosion.

(i) *Management of runoff*—The plan shall contain a narrative consideration of the appropriateness of traditional storm water management practices (practices other than those that control the generation or source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. The plan shall provide that measures that the permittee determines to be reasonable and appropriate shall be implemented and maintained. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity [see Part XI.B.3.a.(2) of this permit (Description of Potential Pollutant Sources)] shall be considered

when determining reasonable and appropriate measures. Appropriate measures may include: vegetative swales and practices; reuse of collected storm water (such as for a process or as an irrigation source); inlet controls (such as oil/water separators); snow management activities; infiltration devices, and wet detention/retention devices; screens or fences used to protect dust and particulate collection activities from wind or to minimize the effects of wind on material loading and storage, and processing activities to eliminate or reduce wind-blown or airborne pollutants; secondary containment of storage areas such as berms and dikes; diversionary structures to direct storm water away from areas of potential contamination; and tarpaulins, roofs, or other coverings of outdoor storage or industrial activities.

(4) *Comprehensive site compliance evaluation*. Qualified personnel shall conduct site compliance evaluations at appropriate intervals specified in the plan, but in no case less than once a year. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with industrial activity such as material storage, handling, and disposal activities shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures sediment and erosion control measures, and other structural pollution prevention measures identified in the plan shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the inspection, the description of potential pollutant sources identified in the plan in accordance with Part XI.B.3.a.(2) of this permit (Description of Potential Pollutant Sources) and pollution prevention measures and controls identified in the plan in accordance with Part XI.B.3.a.(3) of this permit (Measures and Controls) shall be revised as appropriate within 2 weeks of such inspection and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the inspection.

(c) A report summarizing the scope of the inspection, personnel making the inspection, the date(s) of the inspection, major observations relating to the

implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph (4)(b) (above) of the permit shall be made and retained as part of the storm water pollution prevention plan for at least 1 year after coverage under this permit terminates. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) Where compliance evaluation schedules overlap with inspections required under 3.a.(3)(d), the compliance evaluation may be conducted in place of one such inspection.

4. *Numeric effluent limitations.* There are no additional numeric effluent limitations beyond those described in Part V. of this permit.

5. *Monitoring and reporting requirements—*a. *Monitoring requirements—*(1) *Quarterly visual examination of storm water quality.* Facilities shall perform and document a visual examination of a representative storm water discharge associated with industrial activity exposed to storm water. The examination must be made at least once in each designated period [described in (a), below] during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(a) Examinations shall be conducted in each of the following periods for the purposes of visually inspecting storm water quality associated with storm water runoff or snow melt: December to February; March to May; June to August; and September to November.

(b) Examinations shall be made of samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed one hour) of when the runoff or snowmelt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The inspection must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. EPA expects that whenever

practicable the same individual will carry out the collection and examination of discharges for the life of the permit.

When a discharger is unable to collect samples over the course of the monitoring period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions that may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricanes, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(c) Visual observation reports must be maintained onsite in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

(d) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the observation data also applies to the substantially identical outfalls provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explaining in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area (e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)) shall be provided in the plan.

C. Storm Water Discharges Associated With Industrial Activity From Chemical and Allied Products Manufacturing Facilities

1. *Discharges covered under this section.* The requirements listed under this section shall apply to storm water discharges associated with industrial activity represented by Standard

Industrial Classification (SIC) codes from the following activities:

a. *SIC 281 (industrial inorganic chemicals).* This industry group includes establishments primarily engaged in manufacturing basic industrial inorganic chemicals.

b. *SIC 282 (plastic materials and synthetic resins, synthetic rubber, cellulosic and other manmade fibers, except glass).* This group includes chemical establishments primarily engaged in manufacturing plastic materials and synthetic resins, synthetic rubbers, and cellulosic and other manmade fibers.

c. *SIC 284 (soap, detergents, and cleaning preparations; perfumes, cosmetics, and other toilet preparations).* This industry group includes establishments primarily engaged in manufacturing soap and other detergents and in producing glycerin from vegetable and animal fats and oils; specialty cleaning, polishing, and sanitation preparations; surface active preparations used as emulsifiers, wetting agents, and finishing agents, including sulfonated oils; and perfumes, cosmetics, and other toilet preparations.

d. *SIC 285 (paints, varnishes, lacquers, enamels, and allied products).* Establishments primarily engaged in manufacturing paints (in paste and ready-mixed form); varnishes; lacquers; enamels and shellac; putties, wood fillers, and sealers; paint and varnish removers; paint brush cleaners; and allied paint products.

e. *SIC 286 (industrial organic chemicals).* Establishments primarily engaged in manufacturing industrial organic chemicals.

f. *SIC 287 (agricultural chemicals).* This group includes establishments primarily engaged in manufacturing nitrogenous and phosphatic basic fertilizers, mixed fertilizer, pesticides, and other agricultural chemicals.

g. *SIC 289 (miscellaneous chemical products).* Establishments primarily engaged in manufacturing industrial and household adhesives, glues, caulking compounds, sealants, and linoleum, tile, and rubber cements from vegetable, animal, or synthetic plastics materials, purchased or produced in the same establishment; establishments primarily engaged in manufacturing explosives; establishments primarily engaged in manufacturing printing ink, including gravure ink, screen process ink, and lithographic; establishments primarily engaged in manufacturing miscellaneous chemical preparations, not elsewhere classified, such as fatty acids, essential oils, gelatin (except vegetable), sizes, bluing, laundry soaps, writing and stamp pad ink, industrial

compounds, such as boiler and heat insulating compounds, metal, oil, and water treatment compounds, waterproofing compounds, and chemical supplies for foundries.

h. Facilities represented by SIC 3952 (lead pencils, crayons, and artist's materials), but only those primarily engaged in the manufacturing of ink and paints, including china painting enamels, india ink, drawing ink, platinum paints for burnt wood or leather work, paints for china painting, artists' paints and artists' water colors.

i. Co-located industrial activities. When an industrial facility, described by the above eligibility provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

If monitoring and pollution prevention plan requirements of another industrial activity section of this permit apply to co-located industrial activities at an industrial facility, the eligibility provisions of that industrial activity section shall not preclude the operator of the industrial facility from complying with the applicable monitoring and pollution prevention plan requirements of that section.

2. Discharges not covered by this section—*a. Storm water discharges from drug manufacturing facilities and other establishments classified as SIC Code 283.*

3. Special conditions—*a. Prohibition of non-storm water discharges.* This permit does not authorize the discharge of:

(1) Inks, paints, or substances (hazardous, nonhazardous, etc.) resulting from an onsite spill, including materials collected in drip pans.

(2) Washwaters from material handling and processing areas. This includes areas where containers, equipment, and industrial machinery are exposed to storm water.

(3) Washwaters from areas where raw materials, intermediate products, final products, waste materials, by-products, and significant materials from past

industrial activity are exposed to storm water.

(4) Washwaters from drum, tank, or container rinsing and cleaning.

b. Rain gauge installation and precipitation log—(1) Permittees that are required to sample under Part XI.C.6.a. shall install a rain gauge no later than [insert date 270 days after permit issuance] and shall maintain the rain gauge for the extent of the four sampling periods.

(2) After installation of the rain gauge, the permittee shall keep daily records of precipitation indicating the date and amount of precipitation. These records shall be signed by qualified facility personnel and shall be retained onsite in accordance with Part VI.D. (Retention of Records) of this permit.

c. Pollution prevention plan certification. By [insert date 270 days following permit finalization], the permittee shall submit to the appropriate Regional Office, as indicated in Part VI.B., a statement of certification stating that a pollution prevention plan has been developed and implemented in accordance with all conditions and requirements established in this permit. This certification shall include the language and meet the signatory requirements of Part VII.G. of this permit.

4. Storm water pollution prevention plan requirements—*a. Contents of plan.* The plan shall include, at a minimum, the following items:

(1) *Pollution prevention team.* Each plan shall identify a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team. The team will be responsible for developing the storm water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's plan.

(2) *Description of potential pollutant sources.* Each plan shall provide a description of potential sources of pollutants to storm water discharges and sources of discharges of pollutants during dry weather. Each plan shall identify all activities and materials that may be pollutant sources. Each plan shall include, at a minimum:

(a) *Drainage and site plan—*A site map shall be developed for the facility. This map shall include, at a minimum: the location of all structures (manufacturing buildings, garages, etc.), impervious areas, the location of each storm water outfall and/or connection to municipal storm sewer; an outline of the

portions of the drainage area of each outfall within the facility boundaries and a prediction of the direction of flow in each area; each existing structural control measure to reduce pollutants in storm water runoff; surface water bodies; locations where materials are exposed to precipitation; and locations where major spills or leaks identified under Part XI.C.4.a.(2)(c) (below) of this permit have occurred. The map shall also indicate the locations of the following outdoor activities: fueling stations; vehicle and equipment maintenance and/or cleaning areas; loading/unloading areas; locations used for the treatment, storage or disposal of wastes; storage tanks and other containers; processing and storage areas; access roads, rail cars and tracks; the location of transfer of substances in bulk; and machinery.

(b) *Inventory of exposed materials and management practices—*An inventory of the types of materials handled at the site that may be exposed to precipitation shall be collected. Such inventory shall include: a narrative description of materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of 3 years prior to the date of the issuance of this permit and the present; method and location of onsite storage or disposal; materials management practices employed to minimize contact of materials with storm water runoff between the time of 3 years prior to the date of the issuance of this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of any treatment the storm water receives.

(c) *Spills and leaks—*A list of significant spills and leaks of material that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance after the date of 3 years prior to the effective date of this permit. The list shall be updated as appropriate to include any significant spills and leaks during the term of the permit.

(d) *Sampling data—*A summary of existing storm water sampling data describing pollutants discharged from the facility, including a summary of sampling data collected during the term of this permit. In addition, the report of monitoring data that is submitted to EPA pursuant to Part VI. of this permit shall be maintained with the pollution prevention plan.

(e) *Risk identification and summary of potential pollutant sources—*(i) A narrative description of the potential pollutant sources from the following:

loading, unloading, and transfer of chemicals; outdoor storage of salt, pallets, coal, drums, containers, fuels, or other materials; outdoor manufacturing or processing activities; significant dust or particulate generating processes; fueling stations; vehicle and equipment maintenance and/or cleaning areas; locations used for the treatment, storage or disposal (on or off site) of wastes and wastewaters; storage tanks and other containers; processing and storage areas; access roads, rail cars and tracks; the location of transfer of substances in bulk; and machinery.

(ii) The description shall specifically list any significant potential source of pollutants at the site and for each potential source, any pollutant or pollutant parameter (e.g., chemical oxygen demand, etc.) of concern shall be identified.

(iii) Factors to consider include: quantity of chemicals used, produced or discharged; the likelihood of contact with storm water; and history of significant leaks or spills. In addition, flows with a significant potential for causing erosion shall be identified.

(3) *Measures and controls.* Each facility covered by this permit shall develop a description of storm water management controls appropriate for the facility, and implement such controls. The appropriateness and priorities of controls in a plan shall reflect identified potential sources of pollutants at the facility. The description of storm water management controls shall address the following minimum components, including a reasonable schedule for implementing such controls:

(a) *Nonstructural controls—(i) Good housekeeping.* Good housekeeping requires that areas that may contribute pollutants to storm water discharges are maintained in a clean, orderly manner. At a minimum, the permittee shall:

- Schedule regular pickup and disposal of garbage and waste materials. This schedule shall be included in the plan. Individuals responsible for waste management and disposal shall be informed of the procedures established under the plan.
- Routinely inspect for leaks and the condition of drums, tanks and containers. Ensure that spill cleanup procedures are understood by employees.

- Keep an up-to-date inventory of all materials present at the facility. While preparing the inventory, all containers should be clearly labeled. Hazardous containers that requires special handling, storage, use and disposal shall be clearly marked.

- Maintain clean ground surfaces.

(ii) *Preventive maintenance.*—A preventive maintenance program shall be developed and shall involve timely inspection and maintenance of storm water management devices (e.g., oil/water separators, catch basins, dikes, storm sewer, basins, pipes). Also, preventive maintenance includes inspecting and testing facility equipment and systems to uncover conditions that could cause breakdowns or failures, and ensuring appropriate maintenance of such equipment and systems.

(iii) *Spill prevention and response procedures.*—Spill prevention and response procedures shall be developed. Areas where potential spills (that can contribute pollutants to storm water discharges) can occur and their accompanying drainage points shall be identified clearly in the storm water pollution prevention plan. Where appropriate, specifying material handling procedures, storage requirements, and use of equipment such as diversion valves in the plan should be considered. Procedures for cleaning up spills shall be identified in the plan and made available to the appropriate personnel. The necessary equipment to implement a cleanup (e.g., absorbent materials) should be available to personnel.

(iv) *Employee training.*—Employee training programs shall inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise responsible for storm water management at all levels of responsibility of the components and goals of the storm water pollution prevention plan. Training should address topics such as spill response, good housekeeping, material management practices and procedures for equipment and container cleaning and washing. A pollution prevention plan shall identify periodic dates for such training of at least once per year.

(v) *Recordkeeping and internal reporting procedures.*—A description of incidents (such as spills, or other discharges), along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. Inspections and maintenance activities shall be documented and records of such activities shall be incorporated into the plan.

(vi) *Facility security.*—Facilities shall have the necessary security systems to prevent accidental or intentional entry that could cause a discharge. Security systems described in the plan shall address fencing, lighting, vehicular

traffic control, and securing of equipment and buildings.

(b) *Structural practices.*—The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity [see Part XI.C.4.a.(2) (Description of Potential Pollutant Sources) of this permit] shall be considered when determining reasonable and appropriate structural measures. The plan shall provide that measures that the permittee determines to be reasonable and appropriate shall be implemented and maintained.

(i) *Practices for material handling and storage areas.*—Permittees shall ensure the implementation of practices that conform with the following:

- In areas where liquid or powdered materials are stored, facilities shall provide either diking, curbing, or berms.

- In all other outside storage areas including storage of used containers, machinery, scrap and construction materials, and pallets, facilities shall prevent or minimize storm water runoff to the storage area by using curbing, culverting, gutters, sewers or other forms of drainage control.

- In all storage areas, roofs, covers or other forms of appropriate protection shall be used to prevent storage areas from exposure to storm water and wind. For the purpose of this paragraph, tanks would be considered to be appropriate protection.

- In areas where liquid or powdered materials are transferred in bulk from truck or rail cars, permittees shall provide appropriate measures to minimize contact of material with precipitation. Hose connection points at storage containers shall be inside containment areas. Drip pans shall be used in areas that are not in a containment area, where spillage may occur (e.g., hose reels, connection points with rail cars or trucks). Material collected in drip pans shall not be discharged to waters of the United States.

- In areas of transfer of contained or packaged materials and loading/unloading areas, permittee shall provide appropriate protection such as overhangs or door skirts to enclose trailer ends at truck loading/unloading docks.

Drainage from areas covered by paragraph XI.C.4.a.(3)(b)(i) of this section should be restrained by valves or other positive means to prevent the discharge of a spill or leak. Containment units may be emptied by pumps or ejectors; however, these shall be manually activated.

Flapper-type drain valves shall not be used to drain containment areas. Valves

used for the drainage of containment areas should, as far as is practical, be of manual, open-and-closed design.

If facility drainage is not engineered as above, the final discharge of all in-facility sewers shall be equipped with a diversion system that could, in the event of an uncontrolled spill of materials, return the spilled material to the facility.

(c) *Management of runoff*—Plan shall contain a description of storm water management practices used and/or to be used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. Appropriate measures may include: vegetative swales, ripraps, reuse of collected storm water (such as for a process or as an irrigation source), inlet controls (such as oil/water separators), snow management activities, infiltration devices, use of porous pavements, and wet detention/retention devices.

(d) *Sediment and erosion control*—The plan shall identify areas that, due to topography, activities, or other factors, have a potential for significant soil erosion. Plans shall describe permanent stabilization practices and shall ensure that disturbed portions of the site are stabilized. Stabilization practices may include: permanent seeding, mulching, geotextiles, sod stabilization, vegetative buffer strips, protection of trees, preservation of mature vegetation, and other appropriate measures.

(e) *Non-storm water discharges*—(i) The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit. Such certification may not be feasible if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit that receives the discharge. In such cases, the source identification section of the storm water pollution plan shall indicate why the certification required by this part was not feasible, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide

the certification required by this paragraph must notify the Director in accordance with paragraph (iii) (below).

(ii) Except for flows from fire fighting activities, sources of non-storm water listed in Part III.A. (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

(iii) *Failure to certify*—Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director by [insert date 270 days after permit issuance] or, for facilities that begin to discharge storm water associated with industrial activity after [insert date 270 days after permit issuance] 180 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: the procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States that are not authorized by an NPDES permit are unlawful, and must be terminated.

(4) *Comprehensive site compliance evaluation*. A member(s) of the pollution prevention team or a qualified professional designated by the team shall conduct site compliance evaluations.

(a) *Evaluations shall be conducted at least four times each year*—A wet weather evaluation (during a rainfall event) shall be conducted in the second (April to June) and third quarters (July to September) of the year. A dry weather evaluation (no precipitation) shall be conducted in the first (January to April) and fourth quarters (October to December).

(b) When a seasonal dry period is sustained for more than 3 months, a dry weather inspection will satisfy the wet weather comprehensive compliance evaluation inspection requirement.

(c) All areas exposed to precipitation at the facilities shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented or whether additional control measures are needed.

Structural storm water management measures (diking, berming, curbing, sediment and erosion control measures, stabilization controls, etc.) required under this section shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(d) Based on the results of the inspection, the description of potential pollutant sources (see Part XI.C.4.a.(2)) and pollution prevention measures and controls (see Part XI.C.4.a.(3)) identified in the plan shall be revised as appropriate within 2 weeks of such inspection. In addition, it shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the inspection.

(e) A report summarizing the scope of the inspection, personnel making the inspection, the date(s) of the inspection, observations relating to the implementation of the plan, and actions taken in accordance with paragraph XI.C.4.a.(4)(d) (above) shall be made and retained as part of the plan for at least 1 year after coverage under this permit terminates. The report shall also identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

5. *Numeric effluent limitations*. In addition to the numeric effluent limitations described by Part V. of this permit, the following effluent limitations shall be met by existing and new discharges with:

a. *Phosphate fertilizer manufacturing runoff*. The provisions of this paragraph are applicable to storm water discharges from the Phosphate Subcategory of the Fertilizer Manufacturing Point Source Category (40 CFR 418.10). The term contaminated storm water runoff shall mean precipitation runoff, that during manufacturing or processing, comes into contact with any raw materials, intermediate product, finished product, by-products or waste product (40 CFR 418.11(c)). The concentration of pollutants in storm water discharges shall not exceed the effluent limitations in Table C-1.

TABLE C-1.—NUMERIC EFFLUENT LIMITATIONS

| Effluent characteristics | Effluent Limitations (mg/L) | |
|--------------------------|-----------------------------|--|
| | Maximum for any 1 day | Average of daily values for 30 consecutive days shall not exceed |
| Total Phosphorus (as P) | 105.0 | 35.0 |
| Fluoride | 75.0 | 25.0 |

6. Monitoring and reporting requirements—*a. Analytical monitoring*

requirements—During the period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] and the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance], permittees with chemical manufacturing facilities must monitor their storm water discharges associated with industrial activity at least quarterly (4 times per year) except as provided in paragraphs 6.a.(3) (Sampling Waiver), 6.a.(4) (Representative Discharge), and 6.a.(5) (Alternative Certification). Chemical manufacturing facilities are required to monitor their storm water

discharges for the pollutants of concern listed in Table C-2 below. Facilities must report in accordance with 6.b. (Reporting). In addition to the parameters listed in Table C-2 below, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event that generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

TABLE C-2.—MONITORING REQUIREMENTS

| Pollutants of concern | Cut-off concentration (mg/L) |
|-------------------------------------|------------------------------|
| Total recoverable aluminum | 0.75 |
| Ammonia | 0.093 |
| Total recoverable copper | 0.009 |
| Total recoverable manganese | 0.05 |
| Total recoverable zinc | 0.065 |
| Total recoverable iron | 0.3 |
| Total kjeldahl nitrogen (TKN) | 1.5 |
| Nitrate plus nitrite nitrogen | 0.68 |

(1) *Monitoring periods.* Chemical manufacturing facilities shall monitor samples collected during the sampling periods of: January to March, April to June, July to September, and October to December for the years specified in paragraph a. (above).

(2) *Sample type.* A minimum of one grab sample shall be taken. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable. If storm water discharges associated with industrial activity commingle with process or nonprocess water, then where practicable permittees must attempt to sample the storm water discharge before it mixes with the non-storm water discharge.

(3) *Sampling Waiver—(a) Adverse Conditions*—When a discharger is unable to collect samples during one of the monitoring periods specified in

paragraph b. (Monitoring Periods) because of adverse climatic conditions, the discharger may collect two samples from the two separate qualifying events in the next monitoring period and submit this data. Adverse weather conditions that may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricanes, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(b) *Low concentration waiver*—When the average concentration for a pollutant calculated from all monitoring data collected from an outfall during the monitoring period [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] is less than the corresponding value for that pollutant listed in Table C-2 under the column Monitoring Cut-off Concentration, a facility may waive monitoring and reporting requirements in the monitoring period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance]. The facility must submit to the Director, in lieu of the monitoring data, a certification that there has not been a significant change in industrial activity or the pollution prevention measures in area of the

facility that drains to the outfall for which sampling was waived.

(4) *Representative discharge.* When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may test the effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan. The permittee shall include the description of the location of the outfalls, explanation of why outfalls are expected to discharge substantially identical effluents, and estimate of the size of the drainage area and runoff coefficient with the Discharge Monitoring Report.

(5) *Alternative certification.* A discharger is not subject to the monitoring requirements of this section provided the discharger makes a certification for a given outfall, on an annual basis, under penalty of law, signed in accordance with Part VII.G. (Signatory Requirements), that material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, industrial machinery or operations, or significant materials from past industrial activity that are located in areas of the facility within the drainage area of the outfall are not presently exposed to storm water and are not expected to be exposed to storm water for the certification period. Such certification must be retained in the storm water pollution prevention plan, and submitted to EPA in accordance with Part VI.C. of this permit.

b. *Reporting.* Permittees with chemical manufacturing facilities shall submit monitoring results for each outfall associated with industrial activity [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the reporting period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March [insert the date 2 years after permit issuance]. Monitoring results [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance] shall be submitted on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March. A separate Discharge Monitoring Report Form is required for each quarterly sampling period. Signed copies of Discharge Monitoring Reports, or said certifications, shall be submitted to the Director of the NPDES program at the address of the appropriate Regional Office listed in Part VI.G. of the fact sheet.

(1) *Additional notification.* In addition to filing copies of discharge monitoring reports in accordance with paragraph b (above), chemical manufacturing facilities with at least one storm water discharge associated with industrial activity through a large or medium municipal separate storm sewer system (systems serving a population of 100,000 or more) must submit signed copies of discharge monitoring reports to the operator of the municipal separate storm sewer system

in accordance with the dates provided in paragraph b (above).

c. *Compliance monitoring requirements.* In addition to the monitoring required in paragraph b. (above), permittees with contaminated storm water runoff from phosphate fertilizer manufacturing facilities must monitor their contaminated storm water discharges for the presence of phosphorus and fluoride at least annually (one time per year) except as provided in Part XI.C.6.c.(2) (Representative Discharge). Facilities must report in accordance with Part XI.C.6.c.(3) (Reporting). In addition to the parameters listed above, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event that generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled;

(1) *Sample type.* A minimum of one grab sample shall be taken. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable.

(2) *Representative discharge.* When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may test the effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfalls provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explaining in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the

drainage area (e.g., low (under 40 percent), medium (40 to 65 percent) or high (above 65 percent)) shall be provided in the plan. The permittee shall include the description of the location of the outfalls, explanation of why outfalls are expected to discharge substantially identical effluents, and estimate of the size of the drainage area and runoff coefficient with the Discharge Monitoring Report.

(3) *Reporting.* Permittees with phosphate fertilizer manufacturing facilities shall submit monitoring results obtained during the reporting period beginning [insert date of permit issuance] on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following [insert month after permit issuance date]. Signed copies of Discharge Monitoring Reports shall be submitted to the Director of the NPDES program at the address of the appropriate Regional Office indicated in Part VI.B. of this permit.

(4) *Additional notification.* In addition to filing copies of discharge monitoring reports in accordance with paragraph (3) (above), permittees that discharge through a large or medium municipal separate storm sewer system (systems serving a population of 100,000 or more) must submit signed copies of discharge monitoring reports to the operator of the municipal separate storm sewer system in accordance with the dates provided in paragraph (3) (above).

d. *Monthly visual examination of storm water quality.* Facilities shall perform and document a visual examination of a representative storm water discharge associated with industrial activity exposed to storm water. The examination must be made at least once in each month during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(1) Examinations shall be made of samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 1 hour) of when the runoff or snowmelt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The inspection must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable

(greater than 0.1 inch rainfall) storm event. Where practicable, the same individual should carry out the collection and examination of discharges for entire permit term.

(2) Visual observation reports must be maintained onsite in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

(3) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the observation data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

When a discharger is unable to collect samples over the course of the monitoring period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions that may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricanes, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

D. Storm Water Discharges Associated With Industrial Activity From Asphalt Paving and Roofing Materials and Lubricant Manufacturers

1. *Discharges covered under this section—***a. Eligibility—**(1) This permit covers all existing point source discharges of storm water associated

with industrial activity to waters of the United States from facilities engaged in manufacturing asphalt paving and roofing materials, including those facilities commonly identified by Standard Industrial Classification (SIC) codes 2951 and 2952.

(2) This permit covers all existing point source discharges of storm water associated with industrial activity to waters of the United States from portable asphalt plant facilities.

(3) This permit covers all existing point source discharges of storm water associated with industrial activity to waters of the United States from facilities engaged in manufacturing lubricating oils and greases, including those facilities classified as SIC code 2992.

(4) When an industrial facility, described by the above eligibility provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

If monitoring and pollution prevention plan requirements of another industrial activity section of this permit apply to co-located industrial activities at an industrial facility, the eligibility provisions of that industrial activity section shall not preclude the operator of the industrial facility from complying with the applicable monitoring and pollution prevention plan requirements of that section.

b. Limitations on coverage. The following storm water discharges associated with industrial activity are not authorized by this section of the permit:

(1) Storm water discharges from petroleum refining facilities, including those that manufacture asphalt or asphalt products and that are classified as SIC code 2911.

2. *Special conditions—***a. Prohibition of non-storm water discharges—**(1) Discharges of material other than storm water, including vehicle wash water, must be in compliance with an NPDES permit (other than this permit) issued for the discharge.

3. *Storm water pollution prevention plan requirements—***a. Contents of plan.** The plan shall include, at a minimum, the following items:

(1) *Pollution prevention team.* Each plan shall identify a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team that are responsible for developing the storm water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

(2) *Description of potential pollutant sources.* Each plan shall provide a description of potential sources that may reasonably be expected to add significant amounts of pollutants to storm water discharges or that may result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. Each plan shall identify all activities and significant materials that may potentially be significant pollutant sources. Each plan shall include, at a minimum:

(a) *Drainage—*(i) A site map indicating an outline of the portions of the drainage area of each storm water outfall that are within the facility boundaries, each existing structural control measure to reduce pollutants in storm water runoff, surface water bodies, locations where significant materials are exposed to precipitation, locations where major spills or leaks identified under XI.D.3.a.(2)(c) (spills and leaks) of this permit have occurred, and the locations of the following activities where such activities are exposed to precipitation: fueling stations, vehicle and equipment maintenance and/or cleaning areas, loading/unloading areas, locations used for the treatment, storage or disposal of wastes, liquid storage tanks, processing areas and storage areas including areas where raw materials, finished products and drums are stored.

(ii) For each area of the facility that generates storm water discharges associated with industrial activity with a reasonable potential for containing significant amounts of pollutants, a prediction of the direction of flow, and an identification of the types of pollutants that are likely to be present in storm water discharges associated with industrial activity. Factors to consider include the toxicity of a chemical; quantity of chemicals used, produced or discharged; the likelihood

of contact with storm water; and history of significant leaks or spills of toxic or hazardous pollutants. Flows with a significant potential for causing erosion shall be identified.

(b) Inventory of exposed materials—An inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such inventory shall include a narrative description of significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of 3 years prior to the date of the issuance of this permit and the present; method and location of onsite storage or disposal; materials management practices employed to minimize contact of materials with storm water runoff between the time of 3 years prior to the date of the issuance of this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of any treatment the storm water receives.

(c) Spills and leaks—A list of significant spills and significant leaks of toxic or hazardous pollutants that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility after the date of 3 years prior to the effective date of this permit. Such list shall be updated as appropriate during the term of the permit.

(d) Sampling data—A summary of existing discharge sampling data describing pollutants in storm water discharges from the facility, including a summary of sampling data collected during the term of this permit.

(e) Risk identification and summary of potential pollutant sources—A narrative description of the potential pollutant sources from the following activities: Loading and unloading operations; outdoor storage activities; outdoor manufacturing or processing activities; significant dust or particulate generating processes; and onsite waste disposal practices. The description shall specifically list any significant potential source of pollutants at the site and for each potential source, any pollutant or pollutant parameter (e.g., biochemical oxygen demand, etc.) of concern shall be identified.

(3) Measures and controls. Each facility covered by this permit shall develop a description of storm water management controls appropriate for the facility, and implement such controls. The appropriateness and priorities of controls in a plan shall reflect identified potential sources of pollutants at the facility. The

description of storm water management controls shall address the following minimum components, including a schedule for implementing such controls:

(a) Good housekeeping—Good housekeeping requires the maintenance of areas that may contribute pollutants to storm water discharges in a clean, orderly manner. Particular attention should be paid to areas where raw materials are stockpiled, material handling areas, storage areas, liquid storage tanks, material handling areas, and loading/unloading areas.

(b) Preventive maintenance—A preventive maintenance program shall involve timely inspection and maintenance of storm water management devices (e.g., cleaning oil/water separators, catch basins) as well as inspecting and testing facility equipment and systems to uncover conditions that could cause breakdowns or failures resulting in discharges of pollutants to surface waters, and ensuring appropriate maintenance of such equipment and systems.

(c) Spill Prevention and Response Procedures—Areas where potential spills that can contribute pollutants to storm water discharges can occur, and their accompanying drainage points shall be identified clearly in the storm water pollution prevention plan. Where appropriate, specifying material handling procedures, storage requirements, and use of equipment such as diversion valves in the plan should be considered. Procedures for cleaning up spills shall be identified in the plan and made available to the appropriate personnel. The necessary equipment to implement a clean up should be available to personnel.

(d) Inspections—In addition to or as part of the comprehensive site evaluation required under XI.D.3.a.(4) of this section, qualified facility personnel shall be identified to inspect designated equipment and areas of the facility at appropriate intervals specified in the plan. Material storage and handling areas, liquid storage tanks, hoppers or silos, vehicle and equipment maintenance, cleaning, and fueling areas, material handling vehicles, equipment and processing areas shall be inspected at least once per month as part of the maintenance program. A set of tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections. Records of inspections shall be maintained.

(e) Employee training—Employee training programs shall inform personnel responsible for implementing activities identified in the storm water

pollution prevention plan or otherwise responsible for storm water management at all levels of responsibility of the components and goals of the storm water pollution prevention plan. Training should address topics such as spill response, good housekeeping and material management practices. A pollution prevention plan shall identify periodic dates for such training.

(f) Recordkeeping and internal reporting procedures—A description of incidents (such as spills, or other discharges), along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. Inspections and maintenance activities shall be documented and records of such activities shall be incorporated into the plan.

(g) Non-storm water discharges—(i) The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit. Such certification may not be feasible if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit that receives the discharge. In such cases, the source identification section of the storm water pollution plan shall indicate why the certification required by this part was not feasible, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with paragraph XI.D.3.a.(3)(g)(iii) (below).

(ii) Except for flows from fire fighting activities, sources of non-storm water listed in part III.A. (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

(iii) Failure to certify—Any facility that is unable to provide the certification required (testing for non-

storm water discharges), must notify the Director by [Insert date 270 days after permit issuance] or, for facilities that begin to discharge storm water associated with industrial activity after [Insert date 270 days after permit issuance], 180 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: the procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States that are not authorized by an NPDES permit are unlawful, and must be terminated.

(h) *Sediment and erosion control*—The plan shall identify areas that, due to topography, activities, or other factors, have a high potential for significant soil erosion, and identify structural, vegetative, and/or stabilization measures to be used to limit erosion.

(i) *Management of runoff*—The plan shall contain a narrative consideration of the appropriateness of traditional storm water management practices (practices other than those that control the generation or source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. The plan shall provide that measures that the permittee determines to be reasonable and appropriate shall be implemented and maintained. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity (see paragraph XI.D.3.a.(2) of this section (Description of Potential Pollutant Sources)) shall be considered when determining reasonable and appropriate measures. Appropriate measures may include: vegetative swales and practices, reuse of collected storm water (such as for a process or as an irrigation source), inlet controls (such as oil/water separators), snow management activities, infiltration devices, and wet detention/retention devices.

(4) *Comprehensive site compliance evaluation*. Qualified personnel shall conduct site compliance evaluations at appropriate intervals specified in the plan, but in no case less than once a year. Evaluations should be conducted at least once at portable plant locations. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with industrial activity including: material storage and handling areas, liquid storage tanks, hoppers or silos, vehicle and equipment maintenance, cleaning, and fueling areas, material handling vehicles, equipment and processing areas, and areas where aggregate is stockpiled outdoors shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, (e.g., oil/water separators, detention ponds, sedimentation basins) sediment and erosion control measures, and other structural pollution prevention measures identified in the plan shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as dust collection equipment and spill response equipment, shall be made.

(b) Based on the results of the inspection, the description of potential pollutant sources identified in the plan in accordance with XI.D.3.a.(2) of this section (description of potential pollutant sources) and pollution prevention measures and controls identified in the plan in accordance with XI.D.3.a.(3) of this section (measures and controls) shall be revised as appropriate within 2 weeks of such inspection and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the inspection.

(c) A report summarizing the scope of the inspection, personnel making the inspection, the date(s) of the inspection, major observations relating to the implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph (4)(b) (above) of the permit shall be made and retained as part of the storm water pollution prevention plan for at least 1 year after coverage under this permit terminates. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) Where compliance evaluation schedules overlap with inspections required under XI.D.3.a.(3)(d), the compliance evaluation may be conducted in place of one such inspection.

4. *Numeric effluent limitations*. The following numeric effluent limitations are in addition to those in Part V. of this permit. Discharges from areas where production of asphalt paving and roofing emulsions occurs may not exceed a TSS concentration of 23.0 mg/L of runoff for any 1 day, nor shall the average of daily values for 30 executive days exceed a TSS concentration of 15.0 mg/L of runoff. Oil and grease concentrations in storm water discharges from these areas may not exceed 15.0 mg/L of runoff for any 1 day, nor should the average daily values for 30 consecutive days exceed an oil and grease concentration of 10.0 mg/L of runoff. The pH of these discharges must be within the range of 6.0 to 9.0.

5. *Monitoring and reporting requirements*—a. *Monitoring requirements*—(1) Quarterly visual examination of storm water quality. Facilities shall perform and document a visual examination of a representative storm water discharge associated with industrial activity exposed to storm water. The examination must be made at least once in each designated period [described in (a), below] during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(a) Examinations shall be conducted in each of the following periods for the purposes of visually inspecting storm water quality associated with storm water runoff or snow melt: December to February; March to May; June to August; and September to November.

(b) Examinations shall be made of samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 1 hour) of when the runoff or snowmelt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The inspection must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. EPA expects that whenever practicable the same individual will carry out the collection and examination of discharges for the life of the permit.

(c) Visual observation reports must be maintained onsite in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

(d) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the observation data also applies to the substantially identical outfalls provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explaining in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area (e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)) shall be provided in the plan.

When a discharger is unable to collect samples over the course of the monitoring period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions that may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricanes, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

b. Compliance monitoring requirements. Permittees with facilities that produce asphalt paving or roofing emulsions must monitor their storm water discharges associated with these activities for the presence of TSS, oil and grease, and for pH at least annually (one time per year) except as provided in paragraph 5.b.(2) (representative discharge). Facilities must report in accordance with 5.b.(1) (reporting). In addition to the parameters listed above, the permittee shall provide the date and duration (in hours) of the storm event(s)

sampled; rainfall measurements or estimates (in inches) of the storm event that generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled;

(1) *Sample type.* A minimum of one grab sample shall be taken. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable.

(2) *Representative discharge.* When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may test the effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfalls provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explaining in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area (e.g., low (under 40 percent), medium (40 to 65 percent) or high (above 65 percent)) shall be provided in the plan. The permittee shall include the description of the location of the outfalls, explanation of why outfalls are expected to discharge substantially identical effluents, and estimate of the size of the drainage area and runoff coefficient with the Discharge Monitoring Report.

(3) *Reporting.* Permittees with asphalt paving or roofing emulsion production facilities shall submit monitoring results obtained during the reporting period beginning [insert date of permit issuance] on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following [insert

month after permit issuance date]. Signed copies of Discharge Monitoring Reports shall be submitted to the Director of the NPDES program at the address of the appropriate Regional Office indicated in Part VI.B. of this permit.

(4) *Additional notification.* In addition to filing copies of discharge monitoring reports in accordance with paragraph (3) (above), permittees that discharge through a large or medium municipal separate storm sewer system (systems serving a population of 100,000 or more) must submit signed copies of discharge monitoring reports to the operator of the municipal separate storm sewer system in accordance with the dates provided in paragraph (3) (above).

E. Storm Water Discharges Associated With Industrial Activity From Glass, Clay, Cement, Concrete, and Gypsum Product Manufacturing Facilities

1. *Discharges covered under this section.* The requirements listed under this section shall apply to storm water discharges from the following activities: Manufacturing flat, pressed, or blown glass or glass containers; manufacturing hydraulic cement; manufacturing clay products including tile and brick; manufacturing of pottery and porcelain electrical supplies; manufacturing concrete products; manufacturing gypsum products; nonclay refractories; and grinding or otherwise treating minerals and earths. This section generally includes the following types of manufacturing operations:

- Flat Glass, (SIC Code 3211);
- Glass Containers, (SIC Code 3221);
- Pressed and Blown Glass, Not Elsewhere Classified, (SIC Code 3229);
- Hydraulic Cement, (SIC Code 3241)
- Brick and Structural Clay Tile, (SIC Code 3251);
- Ceramic Wall and Floor Tile, (SIC Code 3253);
- Clay Refractories, (SIC Code 3255);
- Porcelain Electrical Supplies, (SIC Code 3264);
- Pottery Products, (SIC Code 3269);
- Concrete Block and Brick, (SIC Code 3271);
- Concrete Products, Except Block and Brick (SIC Code 3272);
- Ready-Mix Concrete, (SIC Code 3273);
- Gypsum Products, (SIC Code 3275);
- Minerals and Earths, Ground or Otherwise Treated, (SIC Code 3295);
- Nonclay Refractories, (SIC Code 3297).

Facilities engaged in the following activities are not eligible for coverage under this section:

- Lime manufacturing (SIC 3274)

- Cut stone and stone products (SIC 3281)
- Abrasive Products (SIC 3291)
- Asbestos Products (SIC 3292)
- Mineral Wool and Mineral Wool Insulation Products (SIC 3297).

When an industrial facility, described by the above eligibility provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

If monitoring and pollution prevention plan requirements of another industrial activity section of this permit apply to co-located industrial activities at an industrial facility, the eligibility provisions of that industrial activity section shall not preclude the operator of the industrial facility from complying with the applicable monitoring and pollution prevention plan requirements of that section.

2 Special conditions—*a. Prohibition of non-storm water discharges.* The discharge of pavement washwaters are only authorized where the discharge is in compliance with Part III.A.2.b.

3 Storm water pollution prevention plan requirements—*a. Contents of plan.* The plan shall include, at a minimum, the following items:

(1) Pollution prevention team. Each plan shall identify a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team that are responsible for developing the storm water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

(2) Description of potential pollutant sources. Each plan shall provide a description of potential sources that may reasonably be expected to add significant amounts of pollutants to storm water discharges or that may result in the discharge of pollutants

during dry weather from separate storm sewers draining the facility. Each plan shall identify all activities and significant materials that may potentially be significant pollutant sources. Each plan shall include, at a minimum:

(a) Drainage—(i) A site map indicating an outline of the portions of the drainage area of each storm water outfall that are within the facility boundaries, each existing structural control measure to reduce pollutants in storm water runoff, surface water bodies, locations where significant materials are exposed to precipitation, locations where major spills or leaks identified under Part XI.E.3.a.(2)(c) (Spills and Leaks) of this permit have occurred, and the locations of the following activities where such activities are exposed to precipitation, fueling stations, vehicle and equipment maintenance and/or cleaning areas, loading/unloading areas, locations used for the treatment, storage or disposal of wastes, liquid storage tanks, processing areas and storage areas. Facilities shall also identify, on the site map, the location of any: Bag house or other dust control device; recycle/sedimentation pond, clarifier or other device used for the treatment of process wastewater and the areas that drain to the treatment device.

(ii) For each area of the facility that generates storm water discharges associated with industrial activity with a reasonable potential for containing significant amounts of pollutants, a prediction of the direction of flow, and an identification of the types of pollutants that are likely to be present in storm water discharges associated with industrial activity. Factors to consider include the toxicity of chemical, quantity of chemicals used, produced or discharged; the likelihood of contact with storm water; and history of significant leaks or spills of toxic or hazardous pollutants. Flows with a significant potential for causing erosion shall be identified.

(b) Inventory of exposed materials—An inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such inventory shall include a narrative description of significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of 3 years prior to the date of the issuance of this permit and the present, method and location of onsite storage or disposal; materials management practices employed to minimize contact of materials with storm water runoff between the time of 3 years prior to the

date of the issuance of this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of any treatment the storm water receives.

(C) Spills and leaks—A list of significant spills and significant leaks of toxic or hazardous pollutants that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility after the date of 3 years prior to the effective date of this permit. Such list shall be updated as appropriate during the term of the permit.

(d) Sampling data—A summary of existing discharge sampling data describing pollutants in storm water discharges from the facility, including a summary of sampling data collected during the term of this permit.

(e) Risk identification and summary of potential pollutant sources—A narrative description of the potential pollutant sources from the following activities: Loading and unloading operations; outdoor storage activities; outdoor manufacturing or processing activities; significant dust or particulate generating processes; and onsite waste disposal practices. The description shall specifically list any significant potential source of pollutants at the site and for each potential source, any pollutant or pollutant parameter (e.g., Total Suspended Solids (TSS), etc.) of concern shall be identified.

(3) Measures and controls. Each facility covered by this permit shall develop a description of storm water management controls appropriate for the facility, and implement such controls. The appropriateness and priorities of controls in a plan shall reflect identified potential sources of pollutants at the facility. The description of storm water management controls shall address the following minimum components, including a schedule for implementing such controls:

Good housekeeping—Good housekeeping requires the maintenance of areas that may contribute pollutants to storm water discharges in a clean, orderly manner.

(i) Facilities shall prevent or minimize the discharge of spilled cement, aggregate (including sand or gravel), kiln dust, fly ash, settled dust other significant materials in storm water from paved portions of the site that are exposed to storm water. Measures used to minimize the presence of these materials may include regular sweeping, or other equivalent measures. The plan shall indicate the frequency of sweeping

or other measures. The frequency shall be determined based upon consideration of the amount of industrial activity occurring in the area and frequency of precipitation, but shall not be less than once per week when cement, aggregate, kiln dust or fly ash are being handled or otherwise processed in the area.

(ii) Facilities shall prevent the exposure of fine granular solids such as cement, fly ash, and kiln dust to storm water. Where practicable, these materials shall be stored in enclosed silos, hoppers or buildings, in covered areas, or under covering.

(b) *Preventive maintenance*—A preventive maintenance program shall involve routine inspection and maintenance of storm water management devices (e.g., cleaning oil/water separators, catch basins) as well as inspecting and testing facility equipment and systems to uncover conditions that could cause breakdowns or failures resulting in discharges of pollutants to surface waters, and ensuring appropriate maintenance of such equipment and systems.

(i) Facilities shall insure that any existing dust collection systems are properly operated and maintained.

(c) *Spill prevention and response procedures*—Areas where potential spills that can contribute pollutants to storm water discharges can occur, and their accompanying drainage points shall be identified clearly in the storm water pollution prevention plan. Where appropriate, specifying material handling procedures, storage requirements, and use of equipment such as diversion valves in the plan should be considered. Procedures for cleaning up spills shall be identified in the plan and made available to the appropriate personnel. The necessary equipment to implement a clean up should be available to personnel.

(d) *Inspections*—Qualified facility personnel shall be identified to inspect designated equipment and areas of the facility specified in the plan. The inspection frequency shall be specified in the plan based upon a consideration of the level of industrial activity at the facility, but shall be a minimum of once per month while the facility is in operation. The inspection shall take place while the facility is in operation and shall at a minimum include all of the following areas that are exposed to storm water at the site: material handling areas, above ground storage tanks, hoppers or silos, dust collection/containment systems, truck wash down and equipment cleaning areas. Tracking or follow-up procedures shall be used to ensure that appropriate actions are

taken in response to the inspections. Records of inspections shall be maintained.

(e) *Employee training*—Employee training programs shall inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise responsible for storm water management at all levels of responsibility of the components and goals of the storm water pollution prevention plan. Training should address topics such as spill response, good housekeeping, truck wash out procedures, equipment wash down procedures and material management practices. A pollution prevention plan shall identify periodic dates for such training.

(f) *Recordkeeping and internal reporting procedures*—A description of incidents (such as spills, or other discharges), along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. Inspections and maintenance activities shall be documented and records of such activities shall be incorporated into the plan.

(g) *Non-storm water discharges*—(i) The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit. Such certification may not be feasible if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit that receives the discharge. In such cases, the source identification section of the storm water pollution plan shall indicate why the certification required by this part was not feasible, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with paragraph XI.E.3.a.(3)(g)(iii) (below).

Facilities engaged in production of ready-mix concrete, concrete block, brick or other products shall include in the certification a description of measures that insure that process waste

water that results from washing of trucks, mixers, transport buckets, forms or other equipment are discharged in accordance with NPDES requirements or are recycled. Facilities with wash water recycle ponds shall include an estimate of the amount of rainfall (in inches) required to cause the recycle pond to overflow in a 24-hour period.

(ii) Except for flows from fire fighting activities, sources of non-storm water listed in Part III.A. (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

(iii) *Failure to certify*—Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director by [Insert date 270 days after permit issuance] or, for facilities that begin to discharge storm water associated with industrial activity after [Insert date 270 days after permit issuance], 180 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: the procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States that are not authorized by an NPDES permit are unlawful, and must be terminated.

(h) *Sediment and erosion control*—The plan shall identify areas that, due to topography, activities, or other factors, have a high potential for significant soil erosion, and identify structural, vegetative, and/or stabilization measures to be used to limit erosion.

(i) *Management of runoff*—The plan shall contain a narrative consideration of the appropriateness of traditional storm water management practices (practices other than those that control the generation or source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. The plan shall provide that measures that the permittee determines to be reasonable and appropriate shall be implemented and maintained. The potential of various sources at the facility to contribute pollutants to storm

water discharges associated with industrial activity [see paragraph XI.E.3.a.(2) of this section (Description of Potential Pollutant Sources)] shall be considered when determining reasonable and appropriate measures. Appropriate measures may include: vegetative swales and practices, reuse of collected storm water (such as for a process or as an irrigation source), inlet controls (such as oil/water separators), snow management activities, infiltration devices, and wet detention/retention devices.

(4) *Comprehensive site compliance evaluation.* Qualified personnel shall conduct site compliance evaluations at appropriate intervals specified in the plan, but, in no case less than once a year. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with industrial activity including but not limited to: material handling areas, above ground storage tanks, hoppers or silos, dust collection/containment systems, truck wash down and equipment cleaning areas shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, and other structural pollution prevention measures such as recycle ponds, identified in the plan shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the inspection, the description of potential pollutant sources identified in the plan in accordance with paragraph XI.E.3.a.(2) of this section (Description of Potential Pollutant Sources) and pollution prevention measures and controls identified in the plan in accordance with paragraph XI.E.3.a.(3) of this section (Measures and Controls) shall be revised as appropriate within 2 weeks of such inspection and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the inspection.

(c) A report summarizing the scope of the inspection, personnel making the inspection, the date(s) of the inspection, major observations relating to the implementation of the storm water pollution prevention plan, and actions

taken in accordance with paragraph XI.E.3.a.(4)(b) (above) of the permit shall be made and retained as part of the storm water pollution prevention plan for at least 1 year after coverage under this permit terminates. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) Where compliance evaluation schedules overlap with inspections required under 3.a.(3)(d), the compliance evaluation may be conducted in place of one such inspection.

4 *Numeric effluent limitations.* In addition to the numeric effluent limitations described by Part V., the following limitations shall be met by existing and new dischargers.

a. *Cement manufacturing facility, material storage runoff.* Any discharge composed of runoff that derives from the storage of materials including raw materials, intermediate products, finished products, and waste materials that are used in or derived from the manufacture of cement shall not exceed a maximum concentration for any time of 50 mg/L Total Suspended Solids (TSS) nor the 6.0 to 9.0 range limitation for pH. Runoff from the storage piles shall not be diluted with other storm water runoff or flows to meet this limitation. Any untreated overflow from facilities designed, constructed and operated to treat the volume of material storage pile runoff that is associated with a 10-year, 24-hour rainfall event shall not be subject to the TSS or pH limitations. Dischargers subject to these numeric effluent limitations must be in compliance with these limits upon commencement of coverage and for the entire term of this permit.

5 *Monitoring and reporting requirements—*a. *Analytical monitoring requirements.* During the period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] and the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance], permittees with brick and structural clay tile (SIC Code 3251), ceramic wall and floor tile (SIC Code 3253), clay refractories (SIC Code 3255), porcelain electrical supplies (SIC Code 3264), pottery products (SIC Code 3269), concrete block and brick (SIC Code 3271), concrete products except block

and brick (SIC Code 3272), and ready-mix concrete (SIC Code 3273) facilities must monitor their storm water discharges associated with industrial activity at least quarterly (4 times per year) except as provided in paragraphs 5.a.(3) (Sampling Waiver), 5.a.(4) (Representative Discharge), and 5.a.(5) (Alternative Certification). Such facilities are required to monitor their storm water discharges for the pollutants of concern listed in Table E-1 below. Facilities must report in accordance with 5.b. (Reporting). In addition to the parameters listed in Table E-1 below, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event that generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

TABLE E-1.—MONITORING REQUIREMENTS

| Pollutants of concern | Monitoring cut-off concentration (mg/L) |
|------------------------------------|---|
| Total Suspended Solids (TSS) | 100 |
| Total Recoverable Aluminum | 0.75 |
| Total Recoverable Copper | 0.009 |
| Total Recoverable Iron | 0.3 |
| Total Recoverable Zinc | 0.065 |

(1) *Monitoring periods.* Brick and structural clay tile (SIC Code 3251), ceramic wall and floor tile (SIC Code 3253), clay refractories (SIC Code 3255), porcelain electrical supplies (SIC Code 3264), pottery products (SIC Code 3269), concrete block and brick (SIC Code 3271), concrete products except block and brick (SIC Code 3272), and ready-mix concrete (SIC Code 3273) shall monitor samples collected during the sampling periods of: January to March, April to June, July to September, and October to December for the years specified in paragraph a. (above).

(2) *Sample type.* A minimum of one grab sample shall be taken. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be

taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable. If storm water discharges associated with industrial activity commingle with process or non-process water, then where practicable permittees must attempt to sample the storm water discharge before it mixes with the non-storm water discharge.

(3) *Sampling waiver*—(a) *Adverse conditions*—When a discharger is unable to collect samples during one of the monitoring periods specified in paragraph 5.a.(1) (Monitoring Periods) because of adverse climatic conditions, the discharger may collect two samples from the two separate qualifying events in the next monitoring period and submit this data. Adverse weather conditions that may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(b) *Low concentration waiver*—When the average concentration for a pollutant calculated from all monitoring data collected from an outfall during the monitoring period [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] is less than the corresponding value for that pollutant listed in Table E-1 under the column Monitoring Cutoff Concentration, a facility may waive monitoring and reporting requirements in the monitoring period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance]. The facility must submit to the Director, in lieu of the monitoring data, a certification that there has not been a significant change in industrial activity or the pollution prevention measures in area of the facility that drains to the outfall for which sampling was waived.

(4) *Representative discharge*. When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may test the effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the

location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan. The permittee shall include the description of the location of the outfalls, explanation of why outfalls are expected to discharge substantially identical effluents, and estimate of the size of the drainage area and runoff coefficient with the Discharge Monitoring Report.

(5) *Alternative certification*. A discharger is not subject to the monitoring requirements of this section provided the discharger makes a certification for a given outfall, on an annual basis, under penalty of law, signed in accordance with Part VII.G. (Signatory Requirements), that material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, industrial machinery or operations, or significant materials from past industrial activity that are located in areas of the facility within the drainage area of the outfall are not presently exposed to storm water and are not expected to be exposed to storm water for the certification period. Such certification must be retained in the storm water pollution prevention plan, and submitted to EPA in accordance with Part VI.C. of this permit.

b. *Reporting*. Permittees with monitoring requirements under Part XI.E.5.a. shall submit monitoring results for each outfall associated with industrial activity [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the reporting period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March [insert the date 2 years after permit issuance]. Monitoring results [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance] shall be submitted on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March. A separate Discharge Monitoring Report Form is required for each quarterly sampling period. Signed copies of Discharge Monitoring Reports, or said

certifications, shall be submitted to the Director of the NPDES program at the address of the appropriate Regional Office listed in Part VI.G. of the fact sheet to this permit.

(1) *Additional notification*. In addition to filing copies of discharge monitoring reports in accordance with paragraph b (above), facilities with monitoring requirements under Part XI.E.5.a. with at least one storm water discharge associated with industrial activity through a large or medium municipal separate storm sewer system (systems serving a population of 100,000 or more) must submit signed copies of discharge monitoring reports to the operator of the municipal separate storm sewer system in accordance with the dates provided in paragraph b (above).

c. *Monthly visual examination of storm water quality*. Glass, clay, cement, concrete, and gypsum manufacturing facilities shall perform and document a visual examination of a representative storm water discharge associated with industrial activity exposed to storm water. Note that this requirement applies to all facilities and not just those subject to the analytical monitoring requirements under Part XI.E.5.a. of this permit. The examination must be made at least once in each month during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(1) Examinations shall be made of grab samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 1 hour) of when the runoff or snowmelt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The inspection must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Where practicable, the same individual should carry out the collection and examination of discharges for entire permit term.

(2) Visual observation reports must be maintained onsite in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of

color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

(3) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the observation data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

(4) When a discharger is unable to collect samples over the course of the monitoring period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions that may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

d. Compliance monitoring requirements. Permittees with cement manufacturing facilities must monitor runoff from material storage for the presence of TSS and pH at least annually (one time per year) except as provided in paragraph 5.d.(2) below (representative discharge). Facilities must report in accordance with 5.d.(3) below (reporting). In addition to the parameters listed above, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event that generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled;

(1) *Sample type.* A minimum of one grab sample shall be taken. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable.

(2) *Representative discharge.* When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may test the effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfalls provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explaining in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area (e.g., low (under 40 percent), medium (40 to 65 percent) or high (above 65 percent)) shall be provided in the plan. The permittee shall include the description of the location of the outfalls, explanation of why outfalls are expected to discharge substantially identical effluents, and estimate of the size of the drainage area and runoff coefficient with the Discharge Monitoring Report.

(3) *Reporting.* Permittees with material storage runoff from cement manufacturing facilities shall submit monitoring results obtained during the reporting period beginning [insert date of permit issuance] on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following [insert month after permit issuance date]. Signed copies of Discharge Monitoring Reports shall be submitted to the Director of the NPDES program at the address of the appropriate Regional Office indicated in Part VI.B. of this permit.

(4) *Additional notification.* In addition to filing copies of discharge

monitoring reports in accordance with paragraph (3) (above), permittees with discharges of material storage runoff from cement manufacturing facilities through a large or medium municipal separate storm sewer system (systems serving a population of 100,000 or more) must submit signed copies of discharge monitoring reports to the operator of the municipal separate storm sewer system in accordance with the dates provided in paragraph 5.d.(3) (above).

F. Storm Water Discharges Associated With Industrial Activity From Primary Metals Facilities

1. *Discharges covered under this section.* The requirements listed under this section of today's permit shall apply to storm water discharges from the primary metal industry. This industry is commonly identified by Standard Industrial Classification (SIC) Major Group 33, that includes the following:

- SIC 331—Steel works, blast furnaces, and rolling and finishing mills
- 3312—Steel works, blast furnaces, and rolling mills
- 3315—Steel wiredrawing and steel nails and spikes
- 3316—Cold-rolled steel sheet, strip, and bars
- 3317—Steel pipes and tubes.
- SIC 332—Iron and steel foundries
- 3321—Gray and ductile iron foundries
- 3322—Malleable iron foundries
- 3324—Steel investment foundries
- 3325—Steel foundries, not elsewhere classified.
- SIC 333—Primary smelting and refining of nonferrous metals
- 3331—Primary smelting and refining of copper
- 3334—Primary production of aluminum
- SIC 334—Secondary smelting and refining of nonferrous metals
- SIC 335—Rolling, drawing, and extruding of nonferrous metals
- 3351—Rolling, drawing, and extruding of copper
- 3356—Rolling, drawing, and extruding of nonferrous metals, except copper and aluminum
- 3357—Drawing and insulating of nonferrous wire.
- SIC 336—Nonferrous foundries (castings)
- 3363—Aluminum die-castings
- 3364—Nonferrous die-castings, except aluminum
- 3365—Aluminum foundries
- 3366—Copper foundries
- 3369—Nonferrous foundries, except copper and aluminum.

- SIC 339—Miscellaneous primary metal products, not elsewhere classified
- 3398—Metal heat treating
- 3399—Primary metal products, not elsewhere classified.

Activities covered include, but are not limited to, storm water discharges associated with coking operations, sintering plants, blast furnaces, smelting operations, rolling mills, casting operations, heat treating, extruding, drawing, or forging of all types of ferrous and nonferrous metals, scrap, and ore.

When an industrial facility, described by the above eligibility provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

If monitoring and pollution prevention plan requirements of another industrial activity section of this permit apply to co-located industrial activities at an industrial facility, the eligibility provisions of that industrial activity section shall not preclude the operator of the industrial facility from complying with the applicable monitoring and pollution prevention plan requirements of that section.

2. Special conditions—*a. Prohibition of non-storm water discharges.* There are no additional requirements beyond those described in Part III. of this permit.

3. Storm water pollution prevention plan requirements—*a. Contents of plan.* The plan shall include, at a minimum, the following items:

(1) Pollution prevention team. Each plan shall identify a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team that are responsible for developing the storm water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall

address all aspects of the facility's storm water pollution prevention plan.

(2) Description of potential pollutant sources. Each plan shall provide a description of potential sources that may reasonably be expected to add significant amounts of pollutants to storm water discharges or that may result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. Each plan shall identify all activities and significant materials that may potentially be significant pollutant sources. Each plan shall include, at a minimum:

(a) Drainage—(i) A site map indicating an outline of the portions of the drainage area of each storm water outfall that are within the facility boundaries, each existing structural control measure to reduce pollutants in storm water runoff, surface water bodies, locations where significant materials are exposed to precipitation, locations where major spills or leaks identified under Part XI.F.3.a.(2)(c) (Spills and Leaks) of this permit have occurred, and the locations of the following activities where such activities are exposed to precipitation: fueling stations, vehicle and equipment maintenance and/or cleaning areas, loading/unloading areas, locations used for the treatment, storage or disposal of wastes such as spent solvents or baths, sand, slag or dross, liquid storage tanks or drums, processing areas including pollution control equipment such as baghouses, and storage areas of raw materials such as coal, coke, scrap, sand, fluxes, refractories, or metal in any form. This list shall also include a description of areas of the facility where settling or deposition of particulate matter from processing operations such as furnace or oven emissions is likely.

(ii) For each area of the facility that generates storm water discharges associated with industrial activity with a reasonable potential for containing significant amounts of pollutants, a prediction of the direction of flow, and an identification of the types of pollutants that are likely to be present in storm water discharges associated with industrial activity. Factors to consider include the toxicity of a chemical; quantity of chemicals used, produced or discharged; the likelihood of contact with storm water; and history of significant leaks or spills of toxic or hazardous pollutants. Flows with a significant potential for causing erosion shall be identified.

(b) Inventory of exposed materials—An inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such

inventory shall include a narrative description of significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of 3 years prior to the date of the issuance of this permit and the present; method and location of onsite storage or disposal; materials management practices employed to minimize contact of materials with storm water runoff between the time of 3 years prior to the date of the issuance of this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of any treatment the storm water receives. This description should also include areas with the potential for deposition of particulate matter from process air emissions or losses during material handling activities. The description shall be updated whenever there is a significant change in the type or quantity of exposed materials, or material management practices, that may affect the exposure of materials to storm water.

(c) Spills and leaks—A list of significant spills and significant leaks of toxic or hazardous pollutants that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility after the date of 3 years prior to the effective date of this permit. Such list shall be updated as appropriate during the term of the permit.

(d) Sampling data—A summary of existing discharge sampling data describing pollutants in storm water discharges from the facility, including a summary of sampling data collected during the term of this permit.

(e) Risk identification and summary of potential pollutant sources—A narrative description of the potential pollutant sources from the following activities: Loading and unloading operations; outdoor storage activities; outdoor manufacturing or processing activities; significant dust or particulate generating processes occurring indoors or out, with or without pollution control equipment in place to trap particulates; and onsite waste disposal practices. The description shall specifically list any significant potential source of pollutants at the site and for each potential source, any pollutant or pollutant parameter (e.g., chemical oxygen demand, oil and grease, copper, lead, zinc, etc.) of concern shall be identified.

(3) Measures and controls. Each facility covered by this permit shall develop a description of storm water management controls appropriate for

the facility, and implement such controls. The appropriateness and priorities of controls in a plan shall reflect identified potential sources of pollutants at the facility. The description of storm water management controls shall address the following minimum components, including a schedule for implementing such controls:

(a) *Good housekeeping*—Good housekeeping requires the maintenance of areas that may contribute pollutants to storm water discharges in a clean, orderly manner. The pollution prevention plan should consider implementation of the following measures where applicable.

(i) Establish a cleaning or maintenance program for all impervious areas of the facility where particulate matter, dust, or debris may accumulate, particularly areas of material loading/unloading, material storage and handling, and processing.

(ii) Pave areas of vehicle traffic or material storage where vegetative or other stabilization methods are not practical. Institute sweeping programs in these areas as well.

(iii) For unstabilized areas of the facility where sweeping is not practical, storm water management devices such as sediment traps, vegetative buffer strips, filter fabric fence, sediment filtering boom, gravel outlet protection, or other equivalent measures, that effectively trap or remove sediment should be considered.

(b) *Source controls*—The permittee shall consider preventive measures to minimize the potential exposure of all significant materials (as described in Part XI.F.3.a.(3) of this section) to precipitation and storm water runoff. The permittee should consider in a narrative description the implementation of the following measures to reduce the exposure of all materials to storm water:

(i) Relocating all materials, including raw materials, intermediate products, material handling equipment, obsolete equipment, and wastes currently stored outside to inside locations.

(ii) Establishment of a schedule for removal of wastes and obsolete equipment to minimize the volume of these materials stored onsite that may be exposed to storm water.

(iii) Substitution of less hazardous materials, or materials less likely to contaminate storm water, or substitution of recyclable materials for nonrecyclables wherever possible.

(iv) Constructing permanent or semipermanent covers, or other similar forms of protection over stockpiled materials, material handling and

processing equipment. Options include roofs, tarps, and covers. This may also include the use of containment bins or covered dumpsters for raw materials, waste materials and nonrecyclable waste materials.

(v) Dikes, berms, curbs, trenches, or other equivalent measures to divert runoff from material storage, processing, or waste disposal areas.

(c) *Preventive maintenance*—A preventive maintenance program shall involve timely inspection and maintenance of storm water management devices (e.g., cleaning oil/water separators, catch basins) as well as inspecting and testing facility equipment and systems to uncover conditions that could cause breakdowns or failures resulting in discharges of pollutants to surface waters, and ensuring appropriate maintenance of such equipment and systems.

(i) A schedule for inspection and maintenance of all particulate emissions control equipment should be established to ensure proper operation. Inspections should be conducted as described in Section XI.F.3.a.(3)(e) below. Detection of any leaks or defects that could lead to excessive emissions shall be repaired as soon as practicable.

(ii) Structural Best Management Practices (BMPs) will be visually inspected for signs of washout, excessive sedimentation, deterioration, damage, or overflowing, and shall be repaired or maintained as soon as practicable.

(d) *Spill prevention and response procedures*—Areas where potential spills that can contribute pollutants to storm water discharges may occur, and their accompanying drainage points shall be identified clearly in the storm water pollution prevention plan. Where appropriate, specifying material handling procedures, storage requirements, and use of equipment such as diversion valves in the plan should be considered. Procedures for cleaning up spills shall be identified in the plan and made available to the appropriate personnel. The necessary equipment to implement a clean up should be available to personnel.

(e) *Inspections*—Qualified facility personnel shall be identified to inspect designated equipment and areas of the facility at appropriate intervals, but no less frequently than once per month. A set of tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections. Records of inspections shall be maintained. Inspections shall be conducted on a monthly basis and address, at a minimum, the following areas where applicable:

(i) Air pollution control equipment such as baghouses, electrostatic precipitators, scrubbers, and cyclones, should be inspected on a routine basis for any signs of disrepair such as leaks, corrosion, or improper operation that could limit their efficiency and lead to excessive emissions. The permittee should consider monitoring air flow at inlets and outlets, or equivalent measures, to check for leaks or blockage in ducts. Visual inspections shall be made for corrosion, leaks, or signs of particulate deposition or visible emissions that could indicate leaks.

(ii) All process or material handling equipment such as conveyors, cranes, and vehicles should be inspected for leaks, drips, etc. or for the potential losses of materials.

(iii) Material storage areas such as piles, bins or hoppers for storing coke, coal, scrap, or slag, as well as chemicals stored in tanks or drums, should be examined for signs of material losses due to wind or storm water runoff.

(f) *Employee training*—Employee training programs shall inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise responsible for storm water management at all levels of responsibility of the components and goals of the storm water pollution prevention plan. Training should address topics such as spill response, good housekeeping and material management practices. A pollution prevention plan shall identify periodic dates for such training.

(g) *Recordkeeping and internal reporting procedures*—A description of incidents (such as spills, or other discharges), along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. Inspections and maintenance activities shall be documented and records of such activities shall be incorporated into the plan.

(h) *Non-storm water discharges*

(i) The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit. Such certification may not

be feasible if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit that receives the discharge. In such cases, the source identification section of the storm water pollution plan shall indicate why the certification required by this part was not feasible, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with paragraph XI.F.3.a.(3)(h)(iii) (below).

(ii) Except for flows from fire fighting activities, sources of non-storm water listed in Part III.A. (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

(iii) *Failure to certify*—Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director by [Insert date 270 days after permit issuance] or, for facilities that begin to discharge storm water associated with industrial activity after [Insert 270 days after permit issuance], 180 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: The procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States that are not authorized by an NPDES permit are unlawful, and must be terminated.

(i) *Sediment and erosion control*—The plan shall identify areas that, due to topography, activities, or other factors, have a high potential for significant soil erosion, and identify structural, vegetative, and/or stabilization measures to be used to limit erosion. The plan shall also contain a narrative consideration of the appropriateness of traditional storm water management practices (practices other than those that control the generation or source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges

from the site. The plan shall provide that measures that the permittee determines to be reasonable and appropriate shall be implemented and maintained. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity (see paragraph XI.F.3.a.(2) of this section (Description of Potential Pollutant Sources) shall be considered when determining reasonable and appropriate measures. Appropriate measures may include: vegetative swales and practices, reuse of collected storm water (such as for a process or as an irrigation source), inlet controls (such as oil/water separators), snow management activities, infiltration devices, and wet detention/retention devices.

(j) *Management of runoff*—Facilities shall consider implementation of the following storm water management practices to address pollutants of concern:

(i) Vegetative buffer strips, filter fabric fence, sediment filtering boom, or other equivalent measures, that effectively trap or remove sediment prior to discharge through an inlet or catch basin.

(ii) Media filtration such as catch basin filters and sand filters.

(iii) Oil/water separators or the equivalent.

(iv) Structural BMPs such as settling basins, sediment traps, retention or detention ponds, recycling ponds or other equivalent measures.

(4) *Comprehensive site compliance evaluation*. Qualified personnel shall conduct site compliance evaluations at appropriate intervals specified in the plan but in no case less than once a year. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with industrial activity such as material storage and handling, loading and unloading, process activities, and plant yards shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, other structural pollution prevention measures identified in the plan, as well as process related pollution control equipment shall be observed or tested to ensure that they are operating correctly. A visual inspection of equipment needed to

implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the inspection, the description of potential pollutant sources identified in the plan in accordance with paragraph XI.F.3.a.(2) of this section (Description of Potential Pollutant Sources) and pollution prevention measures and controls identified in the plan in accordance with paragraph XI.F.3.a.(3) of this section (Measures and Controls) shall be revised as appropriate within 2 weeks of such inspection and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the inspection.

(c) A report summarizing the scope of the inspection, personnel making the inspection, the date(s) of the inspection, major observations relating to the implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph XI.F.3.a.(4)(b) (above) of the permit shall be made and retained as part of the storm water pollution prevention plan for at least 1 year after coverage under this permit terminates. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(i) Where significant settling or deposition from process emissions are observed during proper operation of existing equipment, the permittee shall consider ways to reduce these emissions including but not limited to: Upgrading or replacing existing equipment; collecting runoff from areas of deposition for treatment or recycling; or changes in materials or processes to reduce the generation of particulate matter.

(d) Where compliance evaluation schedules overlap with inspections required under 3.a.(3)(e), the compliance evaluation may be conducted in place of one such inspection.

4. *Numeric effluent limitations*. There are no additional effluent limitations beyond those described in Part V. of this permit.

5. *Monitoring and reporting requirements*—a. *Analytical monitoring requirements*. During the period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] and the period beginning [insert date 3 years

after permit issuance] lasting through [insert date 4 years after permit issuance], permittees with primary metals facilities must monitor their storm water discharges associated with industrial activity at least quarterly (4 times per year) except as provided in paragraphs 5.a.(3) (Sampling Waiver), 5.a.(4) (Representative Discharge), and 5.a.(5) (Alternative Certification). Primary metals facilities are required to monitor their storm water discharges for the pollutants of concern listed in Table F-1 below. Facilities must report in accordance with 5.b. (Reporting). In addition to the parameters listed in Table F-1 below, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event that generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

TABLE F-1.—MONITORING REQUIREMENTS

| Pollutants of concern | Monitoring cut-off concentration (mg/L) |
|-------------------------------------|---|
| Nitrate + Nitrite Nitrogen | 0.68 |
| Total Kjeldahl Nitrogen (TKN) | 1.5 |
| Total Recoverable Aluminum | 0.75 |
| Total Recoverable Copper .. | 0.009 |
| Total Recoverable Manganese | 0.05 |
| Total Recoverable Iron | 0.3 |
| Ammonia | 0.0925 |
| Total Recoverable Zinc | 0.065 |
| Pyrene | 0.0000028 |

(1) *Monitoring periods.* Primary metals facilities shall monitor samples collected during the sampling periods of: January to March, April to June, July to September, and October to December for the years specified in paragraph a. (above).

(2) *Sample type.* A minimum of one grab sample shall be taken. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall

submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable. If storm water discharges associated with industrial activity commingle with process or nonprocess water, then where practicable permittees must attempt to sample the storm water discharge before it mixes with the non-storm water discharge.

(3) *Sampling waiver—(a) Adverse conditions.* When a discharger is unable to collect samples during one of the monitoring periods specified in paragraph b. (Monitoring Periods) because of adverse climatic conditions, the discharger may collect two samples from the two separate qualifying events in the next monitoring period and submit this data. Adverse weather conditions that may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(b) *Low concentration waiver.* When the average concentration for a pollutant calculated from all monitoring data collected from an outfall during the monitoring period [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] is less than the corresponding value for that pollutant listed in Table F-1 under the column Monitoring Cut-off Concentration, a facility may waive monitoring and reporting requirements in the monitoring period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance]. The facility must submit to the Director, in lieu of the monitoring data, a certification that there has not been a significant change in industrial activity or the pollution prevention measures in area of the facility that drains to the outfall for which sampling was waived.

(4) *Representative discharge.* When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may test the effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to

discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan. The permittee shall include the description of the location of the outfalls, explanation of why outfalls are expected to discharge substantially identical effluents, and estimate of the size of the drainage area and runoff coefficient with the Discharge Monitoring Report.

(5) *Alternative certification.* A discharger is not subject to the monitoring requirements of this section provided the discharger makes a certification for a given outfall, on an annual basis, under penalty of law, signed in accordance with Part VII.G. (Signatory Requirements), that material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, industrial machinery or operations, or significant materials from past industrial activity that are located in areas of the facility within the drainage area of the outfall are not presently exposed to storm water and are not expected to be exposed to storm water for the certification period. Such certification must be retained in the storm water pollution prevention plan, and submitted to EPA in accordance with Part VI.C. of this permit.

b. *Reporting.* Permittees with primary metals facilities shall submit monitoring results for each outfall associated with industrial activity [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the reporting period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March [insert the date 2 years after permit issuance]. Monitoring results [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance] shall be submitted on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March. A separate Discharge Monitoring Report Form is required for each quarterly sampling period. Signed copies of Discharge Monitoring Reports, or said certifications, shall be submitted to the Director of the NPDES program at the address of the appropriate Regional

Office listed in Part VI.G. of the fact sheet.

(1) *Additional notification.* In addition to filing copies of discharge monitoring reports in accordance with paragraph b (above), primary metals facilities with at least one storm water discharge associated with industrial activity through a large or medium municipal separate storm sewer system (systems serving a population of 100,000 or more) must submit signed copies of discharge monitoring reports to the operator of the municipal separate storm sewer system in accordance with the dates provided in paragraph b (above).

c. *Monthly visual examination of storm water quality.* Facilities shall perform and document a visual examination of a representative storm water discharge associated with industrial activity exposed to storm water. The examination must be made at least once in each month during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(1) Examinations shall be made of samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 1 hour) of when the runoff or snowmelt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The inspection must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Where practicable, the same individual should carry out the collection and examination of discharges for entire permit term.

(2) Visual observation reports must be maintained onsite in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

(3) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials,

and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the observation data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

When a discharger is unable to collect samples over the course of the monitoring period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions that may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

G. Storm Water Discharges Associated With Industrial Activity From Metal Mining (Ore Mining and Dressing) Facilities

1. *Discharges covered under this section—*a. *Eligibility.* The requirements listed under this section shall apply to storm water discharges from active and inactive metal mining and ore dressing facilities that come under Standard Industrial Classification (SIC) Major Group 10 if the storm water has come into contact with, or is contaminated by, any overburden, raw material, intermediate product, finished product, byproduct, or waste product located on the site of the operation. SIC Major Group 10 includes establishments primarily engaged in mining, developing mines, or exploring for metallic minerals (ores) and also includes all ore dressing and beneficiating operations, whether performed at mills operated in conjunction with the mines served or at mills, such as custom mills, operated separately. For the purposes of this part of the permit, the term "metal mining" includes all ore mining and/or dressing and beneficiating operations, whether

performed at mills operated in conjunction with the mines served or at mills, such as custom mills, operated separately. All storm water discharges from inactive metal mining facilities and the storm water discharges from the following areas of active, and temporarily inactive, metal mining facilities are the only discharges covered by this section of the permit: topsoil piles; offsite haul/access roads if off active area; onsite haul roads if not constructed of waste rock or if spent ore and mine water is not used for dust control; runoff from tailings dams/dikes when not constructed of waste rock/tailings and no process fluids are present; concentration building, if no contact with material piles; mill site, if no contact with material piles; chemical storage area; docking facility, if no excessive contact with waste product; explosive storage; reclaimed areas released from reclamation bonds prior to December 17, 1990; and partially/inadequately reclaimed areas or areas not released from reclamation bonds.

When an industrial facility, described by the above eligibility provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

If monitoring and pollution prevention plan requirements of another industrial activity section of this permit apply to co-located industrial activities at an industrial facility, the eligibility provisions of that industrial activity section shall not preclude the operator of the industrial facility from complying with the applicable monitoring and pollution prevention plan requirements of that section.

Limitations on coverage. The following storm water discharges associated with industrial activity are not authorized by this permit:

(1) Discharges from active metal mining facilities that are subject to the effluent limitation guidelines for the Ore Mining and Dressing Point Source Category (40 CFR part 440). Coverage under this permit does not

include adit drainage or contaminated springs or seeps at active facilities, temporarily inactive facilities, or inactive facilities. Also see Limitations on Coverage, Part I.B.3.

(2) Storm water discharges associated with an industrial activity that the Director (EPA) has determined to be, or may reasonably be expected to be, contributing to a violation of a water quality standard.

(3) Storm water discharges associated with industrial activity from inactive mining operations occurring on Federal lands where an operator cannot be identified.

2. *Special definitions.* The following definitions are only for this section of today's permit and are not intended to supersede the definitions of active and inactive mining facilities established by 40 CFR 122.26(b)(14)(iii):

"Active metal mining facility" is a place where work or other related activity to the extraction, removal, or recovery of metal ore is being conducted. With respect to surface mines, an "active metal mining facility" does not include any area of land on or in which grading has been completed to return the earth to a desired contour and reclamation work has begun.

"Inactive metal mining and dressing facility" means a site where metal mining and/or milling activities occurred in the past but is not an active metal mining facility, as defined in this permit. The term means a site where reclamation subject to applicable State or Federal reclamation requirements has begun but has not been completed and/or the reclamation bond has not been released. The term also includes a site where the mining and/or milling activities occurred prior to the establishment of applicable State and/or Federal reclamation requirements or where there has been no mining or milling activities in the 10 years prior to the effective date of this permit. This definition also includes storm water discharges associated with industrial activity from inactive mine sites occurring on non-Federal lands where an operator cannot be identified.

"Temporarily inactive metal mining facility" means a site where metal mining and/or milling activities occurred in the past, but are not being actively undertaken and the criteria for being considered an inactive metal mining facility are not met.

3. *Storm water pollution prevention plan requirements—*a. *Contents of plan for active and temporarily inactive metal mining facilities.* The plan shall include, at a minimum, the following items:

(1) *Pollution prevention team.* Each plan shall identify a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team that are responsible for developing the storm water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

(2) *Description of mining activities.* The plan shall provide a narrative description of the mining and associated activities taking place at the site that affect or may affect storm water runoff intended to be covered by this permit. The narrative description shall report the total acreage within the mine site, an estimate of the number of acres of disturbed land and an estimate of the total amount of land proposed to be disturbed throughout the life of the mine. A general description of the location of the mining site relative to major transportation routes and communities shall also be provided.

(3) *Description of potential pollutant sources.* Each plan shall provide a description of potential sources that may reasonably be expected to add significant amounts of pollutants (including sediment) to storm water discharges or that may result in the discharge of pollutants during dry weather. Each plan shall identify all activities and significant materials that may potentially be significant storm water pollutant sources from the active mining activity. (see Part XI.G.1.). Each plan shall include, at a minimum:

a. *Drainage—*(i) A site topographic map shall be included in the plan that indicates, at a minimum: Mining/milling site boundaries and access and haul roads; the location of each storm water outfall and an outline of the portions of the drainage area that are within the facility boundaries; equipment storage, fueling and maintenance areas; materials handling areas; storage areas for chemicals and explosives; areas used for storage of overburden, materials, soils or wastes; location of mine drainage (where water leaves mine) or any other process water; tailings piles/ponds, both proposed and existing; heap leach pads; points of discharge from the property for mine drainage or any other process water; springs, streams, wetlands and other surface waters; and boundary of area that contributes runoff to outfalls that are subject to effluent limitations guidelines.

(ii) For each area of the mine/mill site that generates storm water discharges associated with industrial activity with a reasonable potential for containing significant amounts of pollutants, a prediction of the direction of flow, and an identification of the types of pollutants (e.g., heavy metals) that are likely to be present in storm water discharges associated with industrial activity. Factors to consider include the mineralogy of the ore and waste rock (e.g., acid forming), toxicity and quantity of chemical(s) used, produced or discharged; the likelihood of contact with storm water; and history of significant leaks or spills of toxic or hazardous pollutants. Flows with a significant potential for causing erosion shall be identified.

(b) *Inventory of exposed materials—*For each storm water outfall that may be covered under this permit (see Part XI.G.1.), an inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such inventory shall include a narrative description of significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of 3 years prior to the date of the issuance of this permit and the present; method and location of onsite storage or disposal; materials management practices employed to minimize contact of materials with storm water runoff between the time of 3 years prior to the date of the issuance of this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of any treatment the storm water receives. The inventory of exposed materials shall include, but shall not be limited to the significant materials stored exposed to storm water and material management practices employed that were listed for the facility in the approved group application.

A summary of any existing ore or waste rock/overburden characterization data, including results of testing for acid rock generation potential. If the ore or waste rock/overburden characterization data is updated due to a change in the ore type being mined, the storm water pollution prevention plan shall be updated with the new data.

(c) *Spills and leaks—*A list of significant spills and significant leaks of toxic or hazardous pollutants that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility after the date of 3 years prior to the effective date of this permit. Such list

shall be updated as appropriate during the term of the permit.

(d) *Sampling data*—A summary of existing discharge sampling data describing pollutants in storm water discharges from the facility, including a summary of sampling data collected during the term of this permit.

(e) *Risk identification and summary of potential pollutant sources*—A narrative description of the potential pollutant sources from the following activities associated with metal mining: Loading and unloading operations; outdoor storage activities; outdoor manufacturing or processing activities; significant dust or particulate generating processes; and onsite waste disposal practices. The description shall specifically list any significant potential source of pollutants at the site and for each potential source, any pollutant or pollutant parameter (e.g., heavy metals, etc.) of concern shall be identified.

(4) *Measures and controls*. Each facility covered by this permit shall develop a description of storm water management controls appropriate for the facility, and implement such controls. The appropriateness and priorities of controls in a plan shall reflect identified potential sources of pollutants at the facility. The description of storm water management controls shall address the following minimum components, including a schedule for implementing such controls:

(a) *Good housekeeping*—Good housekeeping requires the maintenance of areas that may contribute pollutants to storm water discharges in a clean, orderly manner. (For suggested measures for vehicle maintenance operations, see good housekeeping measures specified in Part XI.P. for transportation facilities.)

(b) *Preventive maintenance*—A preventive maintenance program shall involve timely inspection and maintenance of storm water management devices (e.g., cleaning oil/water separators, catch basins) as well as inspecting and testing facility equipment and systems to uncover conditions that could cause breakdowns or failures resulting in discharges of pollutants to surface waters, and ensuring appropriate maintenance of such equipment and systems. Particular attention shall be given to erosion control and sediment control systems and devices.

(c) *Spill prevention and response procedures*—Areas where potential spills that can contribute pollutants to storm water discharges can occur, and their accompanying drainage points shall be identified clearly in the storm

water pollution prevention plan. Where appropriate, specifying material handling procedures, storage requirements, and use of equipment such as diversion valves in the plan should be considered. Procedures for cleaning up spills shall be identified in the plan and made available to the appropriate personnel. The necessary equipment to implement a clean up should be available to personnel.

(d) *Inspections*—The plan shall identify qualified personnel that shall inspect designated equipment and mine areas at least on a monthly basis for active sites. The monthly inspections can be done by any time during the month and do not have to be done immediately following a precipitation event. For temporarily inactive sites, the inspections should be quarterly; however, inspections are not required when adverse weather conditions (e.g., snow) make the site inaccessible. All material handling areas shall be inspected for evidence of, or the potential for, pollutants entering the drainage system. Erosion control systems and sediment control devices shall also be inspected to determine if they are working properly. A set of tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections. Records of inspections shall be maintained. The use of a checklist developed by the facility is encouraged.

(e) *Employee training*—Employee training programs shall inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise responsible for storm water management at all levels of responsibility of the components and goals of the storm water pollution prevention plan. Training should address topics such as spill response, good housekeeping, and material management practices. The pollution prevention plan shall specify how often training shall take place, but in all cases training must be held at least semiannually.

(f) *Recordkeeping and internal reporting procedures*—A description of incidents (such as spills, or other discharges), along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. Inspections and maintenance activities shall be documented and records of such activities shall be incorporated into the plan.

Non-storm water discharges—(i) The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm

water discharges, such as seeps or adit discharges or discharges subject to effluent limitation guidelines (e.g., 40 CFR Part 440), such as mine drainage or process water of any kind. The certification shall include the identification of potential significant sources of non-storm water or water subject to effluent limitation guidelines at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit. Such certification may not be feasible if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit that receives the discharge. In such cases, the source identification section of the storm water pollution plan shall indicate why the certification required by this part was not feasible, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with paragraph XI.G.3.a.(4)(g)(iii) (below).

Alternatively, the plan may include a certification that any non-storm water discharge that mixes with storm water is subject to a separate NPDES permit that applies applicable effluent limitations prior to the mixing of non-storm water and storm water. In such cases, the certification shall identify the non-storm water discharge(s), the applicable NPDES permit(s), the effluent limitations placed on the non-storm water discharge by the NPDES permit(s), and the point(s) at which the limitations are applied.

(ii) Except for flows from fire fighting activities, sources of non-storm water listed in Part III.A. (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

(iii) *Failure to certify*—Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director by [Insert date 270 days after permit issuance] or, for facilities that begin to discharge storm water associated with industrial activity after

[Insert date 270 days after permit issuance], 180 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: the procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States that are not authorized by an NPDES permit are unlawful, and must be terminated.

(h) Sediment and erosion control—The plan shall identify areas that, due to topography, activities, or other factors, have a high potential for significant erosion of soil and/or other materials, and identify measures to be used to limit erosion and/or remove sediment from storm water runoff. The measures to consider include diversion of flow away from areas susceptible to erosion, stabilization methods to prevent or minimize erosion, and structural methods for controlling sediment. These can include the following:

Diversion practices include the following: Interceptor dikes and swales; diversion dikes curbs and berms; pipe slope drains; subsurface drains; and drainage/storm water conveyance systems (channels or gutters; open top box culverts, and waterbars; rolling dips and road sloping; roadway surface water deflector; and culverts).

Stabilization practices include the following: Temporary or permanent seeding; vegetative buffer strips; protection of trees; topsoiling; soil conditioning; contouring; mulching; geotextiles (matting; netting; or blankets); riprap; gabions; and retaining walls.

Structural practices include the use of the following: Check dams; rock outlet protection; level spreaders; gradient terraces; straw bale barriers; silt fences; gravel or stone filter berms; brush barriers; sediment traps; grass swales; pipe slope drains; earth dikes; and other controls such as entrance stabilization, waterway crossings or wind breaks.

(i) Management of runoff—The plan shall contain a narrative consideration of the appropriateness of traditional storm water management practices (practices other than those that control the generation or source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. The plan shall provide that measures

that the permittee determines to be reasonable and appropriate shall be implemented and maintained. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity [see paragraph XI.G.3.a.(3) of this section (Description of Potential Pollutant Sources)] shall be considered when determining reasonable and appropriate measures. Appropriate measures may include: vegetative swales and practices, reuse of collected storm water (such as for a process or as an irrigation source), inlet controls (such as oil/water separators), snow management activities, infiltration devices, and wet detention/retention devices, or impoundments.

(j) Capping—In some cases, the elimination of a pollution source through capping contaminant sources may be the most effective control measure for discharges from inactive ore mining and dressing facilities. If capping of a contaminant source is necessary, the plan must identify which source is being capped and materials and procedures used to cap the contaminant source.

(k) Treatment—If treatment of a storm water discharge is necessary, the plan must describe how storm water will be treated prior to discharging to waters of the United States. Storm water treatments include the following: chemical/physical treatment; oil/water separators; and artificial wetlands.

(5) Comprehensive site compliance evaluation. Qualified personnel shall conduct site compliance evaluations at appropriate intervals specified in the plan, but in no case less than once a year. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with industrial activity shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, and other structural pollution prevention measures identified in the plan shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the inspection, the description of potential pollutant sources identified in the plan in accordance with paragraph

XI.G.3.a.(3) of this section (Description of Potential Pollutant Sources) and pollution prevention measures and controls identified in the plan in accordance with paragraph XI.G.3.a.(4) of this section (Measures and Controls) shall be revised as appropriate within 2 weeks of such inspection and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the inspection.

(c) A report summarizing the scope of the inspection, personnel making the inspection, the date(s) of the inspection, major observations relating to the implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph XI.G.3.a.(5)(b) (above) of the permit shall be made and retained as part of the storm water pollution prevention plan for at least 1 year after coverage under this permit terminates. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) Where compliance evaluation schedules overlap with inspections required under XI.G.3.a.(4)(d), the compliance evaluation may be conducted in place of one such inspection.

b. Contents of plan for inactive metal mining facilities. The plan shall include, at a minimum, the following items:

(1) Pollution Prevention Team. Each plan shall identify a specific individual or individuals that are responsible for the development, implementation, maintenance, and revision of the storm water pollution prevention plan. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the storm water pollution prevention plan at the inactive facility.

(2) Description of Mining Activities. The plan shall provide a narrative description of the mining and associated activities that took place at the site. The narrative description shall report the approximate dates of operation, the total acreage within the mine and/or processing site, an estimate of the number of acres of disturbed area, and the current activities (e.g., reclamation) that are taking place at the facility. A general description of the location of the mining site relative to major

transportation routes and communities shall also be provided.

(3) *Description of Potential Pollutant Sources.* Each plan shall provide a description of potential sources that may reasonably be expected to add significant amounts of pollutants (including sediment) to storm water discharges or that may result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. Each plan shall identify all activities and significant materials that may potentially be significant storm water pollutant sources from the inactive mining site. Each plan shall include, at a minimum:

(a) *Site Map*—A generalized site map or maps that indicate any of the following that may be applicable: mining/milling site boundaries and access and haul roads; the location of each storm water outfall and an outline of the portions of the drainage area that are within the facility boundaries; areas used for storage of overburden, materials, soils, tailings, or wastes; areas used for outdoor manufacturing, storage, or disposal of materials; any remaining equipment storage, fueling, and maintenance areas; tailings piles/ponds; mine drainage or any other process water discharge points; an estimate of the direction(s) of flow; existing structural controls to reduce pollutants in storm water runoff; and springs, streams, wetlands, and other surface waters.

(b) *Inventory of exposed materials*—The plan shall include for each outfall an inventory and narrative description of any significant materials that may still be at the site. This description of sources should agree with sources identified on the map.

(c) *Sampling data*—A summary of existing discharge sampling data describing pollutants in storm water discharges from the facility, including a summary of sampling data collected during the term of this permit.

(d) *Risk identification and summary of potential pollutant sources*—For each potential pollutant source at the site the pollutants of concern (e.g., heavy metals) shall be identified and an assessment made of the potential of these pollutant sources to contribute pollutants to storm water discharges.

(4) *Measures and controls.* Each facility covered by this permit shall develop a description of storm water management controls appropriate for the facility, and implement such controls. The appropriateness and priorities of controls in a plan shall reflect identified potential sources of pollutants at the facility. The description of storm water management

controls shall address the following minimum components, including a schedule for implementing such controls:

(a) *Storm water diversion*—Describe how and where storm water will be diverted away from potential pollutant sources to prevent storm water contamination. Storm water diversions include the following: interceptor dikes and swales; diversion dikes curbs and berms; pipe slope drains; subsurface drains; and drainage/storm water conveyance systems (channels or gutters; open top box culverts, and waterbars; rolling dips and road sloping; roadway surface water deflector; and culverts).

(b) *Sediment and erosion control*—The plan shall identify areas that, due to topography, activities, or other factors, have a high potential for significant erosion of soil and/or other materials, and identify measures to be used to limit erosion and/or remove sediment from storm water runoff. The measures to consider include diversion of flow away from areas susceptible to erosion, stabilization methods to prevent or minimize erosion, and structural methods for controlling sediment. These can include the following:

Stabilization practices include the following: Temporary or permanent seeding; vegetative buffer strips; protection of trees; topsoiling; soil conditioning; contouring; mulching; geotextiles (matting; netting; or blankets); riprap; gabions; and retaining walls.

Structural practices include the use of the following: check dams; rock outlet protection; level spreaders; gradient terraces; straw bale barriers; silt fences; gravel or stone filter berms; brush barriers; sediment traps; grass swales; pipe slope drains; earth dikes; and other controls such as entrance stabilization, waterway crossings or wind breaks.

(c) *Management of runoff*—The plan shall contain a narrative consideration of the appropriateness of traditional storm water management practices (practices other than those that control the generation or source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. The plan shall provide that measures that the permittee determines to be reasonable and appropriate shall be implemented and maintained. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity [see paragraph XI.G.3.b.(3) of this section (Description

of Potential Pollutant Sources)] shall be considered when determining reasonable and appropriate measures. Appropriate measures may include: vegetative swales and practices, reuse of collected storm water (such as for a process or as an irrigation source), inlet controls, snow management activities, infiltration devices, and wet detention/retention devices, or impoundments.

(d) *Capping*—In some cases, the elimination of a pollution source through capping contaminant sources may be the most effective control measure for discharges from inactive ore mining and dressing facilities. If capping of a contaminant source is necessary, the plan must identify which source is being capped and materials and procedures used to cap the contaminant source.

(e) *Treatment*—If treatment of a storm water discharge is necessary, the plan must describe how storm water will be treated prior to discharging to waters of the United States. Storm water treatments include the following: chemical/physical treatment; oil/water separators; and artificial wetlands.

(f) *Recordkeeping and internal reporting procedures*—A description of incidents (such as spills, or other discharges), along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. Inspections and maintenance activities shall be documented and records of such activities shall be incorporated into the plan.

(5) *Comprehensive site compliance evaluation.* Qualified personnel shall conduct site compliance evaluations at appropriate intervals specified in the plan, but, except as provided in paragraph XI.G.3.b.(5)(d) (below), in no case less than once a year. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with industrial activity shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, and other structural pollution prevention measures identified in the plan shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the inspection, the description of potential pollutant sources identified in the plan in accordance with paragraph XI.G.3.b.(3) of this section (Description of Potential Pollutant Sources) and pollution prevention measures and controls identified in the plan in accordance with paragraph XI.G.3.b.(4) of this section (Measures and Controls) shall be revised as appropriate within 2 weeks of such inspection and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the inspection.

(c) A report summarizing the scope of the inspection, personnel making the inspection, the date(s) of the inspection, major observations relating to the implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph XI.G.3.b.(5)(b) (above) of the permit shall be made and retained as part of the storm water pollution prevention plan for at least 1 year after coverage under this permit terminates. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) Where annual site inspections are shown in the plan to be impractical for inactive mining sites due to the remote location and inaccessibility of the site, site inspections required under this part shall be conducted at appropriate intervals specified in the plan, but, in no case less than once in 3 years.

4. *Numeric effluent limitations.* There are no additional numeric effluent limitations beyond those described in Part V. of this permit.

5. *Monitoring and reporting requirements—*a. *Analytical monitoring requirements.* During the period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] and the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance], metal mining and dressing facilities must monitor their storm water discharges associated with industrial activity at least quarterly (4 times per year) except as provided in paragraphs 5.a.(3) (Sampling Waiver), 5.a.(4) (Representative Discharge), and 5.a.(5) (Alternative Certification). Active ore mining and dressing facilities are required to monitor their storm water

discharges for the pollutants of concern listed in Table G-1 below. Facilities must report in accordance with 5.b. (Reporting). In addition to the parameters listed in Table G-1 below, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event that generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

TABLE G-1.—MONITORING REQUIREMENTS FOR ACTIVE FACILITIES

| Pollutants of concern | Monitoring cut-off concentration (mg/L) |
|-------------------------------------|---|
| Chemical Oxygen Demand (COD) | 65 |
| Total Suspended Solids (TSS) | 100 |
| Total Kjeldahl Nitrogen (TKN) | 1.5 |
| Nitrate plus Nitrite Nitrogen | 0.68 |
| Total Phosphorus | 0.33 |
| Ammonia | 0.093 |
| Total Recoverable Antimony | 0.088 |
| Total Recoverable Arsenic | 0.000018 |
| Total Recoverable Copper | 0.009 |
| Total Recoverable Iron | 0.3 |
| Total Recoverable Lead | 0.0337 |
| Total Recoverable Manganese | 0.05 |
| Total Recoverable Zinc | 0.065 |

(1) *Monitoring periods.* Active ore mining and dressing facilities shall monitor samples collected during the sampling periods of: January to March, April to June, July to September, and October to December for the years specified in paragraph a. (above).

(2) *Sample type.* A minimum of one grab sample shall be taken. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable. If storm water discharges associated with industrial activity commingle with

process or non-process water, then where practicable permittees must attempt to sample the storm water discharge before it mixes with the non-storm water discharge.

(3) *Sampling waiver—*(a) *Adverse Conditions—*When a discharger is unable to collect samples during one of the monitoring periods specified in paragraph 5.a.(1) (Monitoring Periods) because of adverse climatic conditions, the discharger may collect two samples from the two separate qualifying events in the next monitoring period and submit this data. Adverse weather conditions that may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(b) *Low concentration waiver—*When the average concentration for a pollutant calculated from all monitoring data collected from an outfall during the monitoring period [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] is less than the corresponding value for that pollutant listed in Table G-1 under the column Monitoring Cut-off Concentration, a facility may waive monitoring and reporting requirements in the monitoring period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance]. The facility must submit to the Director, in lieu of the monitoring data, a certification that there has not been a significant change in industrial activity or the pollution prevention measures in area of the facility that drains to the outfall for which sampling was waived.

(4) *Representative discharge.* When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may test the effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an

estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan. The permittee shall include the description of the location of the outfalls, explanation of why outfalls are expected to discharge substantially identical effluents, and estimate of the size of the drainage area and runoff coefficient with the Discharge Monitoring Report.

(5) *Alternative certification.* A discharger is not subject to the monitoring requirements of this section provided the discharger makes a certification for a given outfall, on an annual basis, under penalty of law, signed in accordance with Part VII.G. (Signatory Requirements), that material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, industrial machinery or operations, or significant materials from past industrial activity that are located in areas of the facility within the drainage area of the outfall are not presently exposed to storm water and are not expected to be exposed to storm water for the certification period. Such certification must be retained in the storm water pollution prevention plan, and submitted to EPA in accordance with Part VI.C. of this permit.

b. *Reporting.* Permittees with active ore mining and dressing facilities shall submit monitoring results for each outfall associated with industrial activity [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the reporting period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March [insert the date 2 years after permit issuance]. Monitoring results [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance] shall be submitted on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March. A separate Discharge Monitoring Report Form is required for each quarterly sampling period. Signed copies of Discharge Monitoring Reports, or said certifications, shall be submitted to the Director of the NPDES program at the address of the appropriate Regional Office listed in Part VI.G. of the fact sheet to this permit.

(1) *Additional notification.* In addition to filing copies of discharge

monitoring reports in accordance with paragraph b (above), active ore mining and dressing facilities with at least one storm water discharge associated with industrial activity through a large or medium municipal separate storm sewer system (systems serving a population of 100,000 or more) must submit signed copies of discharge monitoring reports to the operator of the municipal separate storm sewer system in accordance with the dates provided in paragraph b (above).

c. *Visual examination of storm water quality.* Active and temporarily inactive mining facilities shall perform and document a visual examination of a representative storm water discharge associated with industrial activity exposed to storm water. The examination must be made during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event. Active mining facilities must examine storm water quality at least once in each month. The examination for temporarily inactive mining facilities must be made at least once a year (the same frequency as the Comprehensive Site Compliance Evaluation). Visual examination of Storm Water Quality at inactive mining facilities is not required.

(1) Examinations shall be made of grab samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 1 hour) of when the runoff or snowmelt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The inspection must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Where practicable, the same individual should carry out the collection and examination of discharges for entire permit term.

(2) Visual observation reports must be maintained onsite in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable

sources of any observed storm water contamination.

(3) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the observation data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

(4) When a discharger is unable to collect samples over the course of the monitoring period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions that may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

H. Storm Water Discharges Associated With Industrial Activity From Coal Mines and Coal Mining-Related Facilities

1. *Discharges covered under this section.* The requirements listed under this section shall apply to storm water discharges from coal mining-related areas if they are not subject to effluent limitations guidelines under 40 CFR Part 434. Coal mines are commonly identified by Standard Industrial Classification (SIC) Major Group 12. Storm water discharges from the following portions of coal mines may be eligible for this permit:

- Haul Roads—Nonpublic roads on which coal or coal refuse is conveyed.
- Access Roads—Nonpublic roads providing light vehicular traffic within the facility property and to public roadways.
- Railroad Spurs, Sidings, and Internal Haulage Lines—Rail lines used for hauling coal within the facility

property and to offsite commercial railroad lines or loading areas.

- Conveyor Belts, Chutes, and Aerial Tramway Haulage Areas—Areas under and around coal or refuse conveyor areas, including transfer stations.

- Equipment Storage and Maintenance Yards.

- Coal Handling Buildings and Structures.

- Inactive Coal Mines and Related Areas—Abandoned and other inactive mines, refuse disposal sites and other mining-related areas.

When an industrial facility, described by the above eligibility provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

If monitoring and pollution prevention plan requirements of another industrial activity section of this permit apply to co-located industrial activities at an industrial facility, the eligibility provisions of that industrial activity section shall not preclude the operator of the industrial facility from complying with the applicable monitoring and pollution prevention plan requirements of that section.

2. Special conditions—*a. Prohibition of non-storm water discharges.*

Excluded from coverage under this permit are point source discharges of pollutant seeps or underground drainage from inactive coal mines and refuse disposal areas that do not occur as storm water discharges in response to precipitation events.

3. Storm water pollution prevention plan requirements.

Most of the active coal mining-related areas described in paragraph XI.H.1. above, are subject to sediment and erosion control regulations of the U.S. Office of Surface Mining (OSM) that enforces the Surface Mining Control and Reclamation Act (SMCRA). OSM has granted authority to most coal states to implement SMCRA through State SMCRA regulations. All SMCRA requirements regarding control of erosion, siltation and other pollutants resulting from storm water runoff,

including road dust resulting from erosion, shall be minimum requirements of the pollution prevention plan and shall be included in the contents of the plan directly, or by reference.

a. Contents of plan. The plan shall include at a minimum, the following items:

(1) *Pollution prevention team.* Each plan shall identify a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team that are responsible for developing the storm water pollution prevention plan and assisting the facility manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

(2) *Description of potential pollutant sources.* Each plan shall provide a description of potential sources that may reasonably be expected to add significant amounts of pollutants to storm water discharges or that may result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. Each plan shall identify all activities and significant materials that may potentially be significant pollutant sources. Each plan shall include, at a minimum:

(a) *Drainage—(i)* A site map, such as a drainage map required for SMCRA permit applications, that indicate drainage areas and storm water outfalls. These shall include but not be limited to the following:

- Drainage direction and discharge points from all applicable mining-related areas described in Section XI.H.1.a. (discharges covered under this section) above, including culvert and sump discharges from roads and rail beds and also from equipment and maintenance areas subject to storm runoff of fuel, lubricants and other potentially harmful liquids.

- Location of each existing erosion and sedimentation control structure or other control measures for reducing pollutants in storm water runoff.

- Receiving streams or other surface water bodies.

- Locations exposed to precipitation that contain acidic spoil, refuse or unreclaimed disturbed areas.

- Locations where major spills or leaks of toxic or hazardous pollutants have occurred.

- Locations where liquid storage tanks containing potential pollutants, such as caustics, hydraulic fluids and lubricants, are exposed to precipitation.

- Locations where fueling stations, vehicle and equipment maintenance areas are exposed to precipitation.

(ii) For each area of the facility that generates storm water discharges associated with the mining-related activity with a reasonable potential for containing significant amounts of pollutants, a prediction of the direction of flow, and an identification of the types of pollutants that are likely to be present in storm water discharges associated with the activity. Factors to consider include the toxicity of the pollutant; quantity of chemicals used, produced or discharged; the likelihood of contact with storm water; and history of significant leaks or spills of toxic or hazardous pollutants. Flows with a significant potential for causing erosion shall be identified.

(b) *Inventory of exposed materials—*An inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such inventory shall include a narrative description of significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of 3 years prior to the date of the issuance of this permit and the present; method and location of onsite storage or disposal; materials management practices employed to minimize contact of materials with storm water runoff between the time of 3 years prior to the date of the issuance of this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of any treatment the storm water receives.

(c) *Spills and leaks—*A list of significant spills and leaks of toxic or hazardous pollutants that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility after the date of 3 years prior to the effective date of this permit. Such list shall be updated as appropriate during the term of the permit.

(d) *Sampling data—*A summary of any existing discharge sampling data describing pollutants in storm water discharges from the portions of the facility covered by this permit, including a summary of any sampling data collected during the term of this permit.

(e) *Risk identification and summary of potential pollutant sources—*A narrative description of the potential pollutant sources from the following activities: truck traffic on haul roads and resulting generation of sediment subject to runoff and dust generation; fuel or

other liquid storage; pressure lines containing slurry, hydraulic fluid or other potential harmful liquids; and loading or temporary storage of acidic refuse or spoil. Specific potential pollutants shall be identified, where known.

(3) *Measures and controls.* Each facility covered by this permit shall develop a description of storm water management controls appropriate for the facility and implement such controls. The appropriateness and priorities of controls in a plan shall reflect identified potential sources of pollutants at the facility. The description of storm water management controls shall address the following minimum components, including a schedule for implementing such controls.

(a) *Good housekeeping.*—Good housekeeping requires the maintenance of areas that may contribute pollutants to storm water discharges in a clean, orderly manner. These would be practices that would minimize the generation of pollutants at the source or before it would be necessary to employ sediment ponds or other control measures at the discharge outlets. Where applicable, such measures would include the following:

- Sweepers and covered storage to minimize dust generation and storm runoff
- Conservation of vegetation where possible to minimize erosion
- Watering of haul roads to minimize dust generation
- Collection, removal, and proper disposal of waste oils and other fluids resulting from vehicle and equipment maintenance.

(b) *Preventive maintenance.*—A preventive maintenance program shall involve timely inspection and maintenance of storm water management devices as well as inspecting and testing facility equipment and systems to uncover conditions that could cause breakdowns or failures resulting in discharges of pollutants to surface waters, and ensuring appropriate maintenance of such equipment and systems. Where applicable, such measures would include the following:

- Removal and proper disposal of settled solids in catch basins to allow sufficient retention capacity
- Periodic replacement of siltation control measures subject to deterioration such as straw bales
- Inspections of storage tanks and pressure lines for fuels, lubricants, hydraulic fluid or slurry to prevent leaks due to deterioration or faulty connections.

(c) *Spill prevention and response procedures.*—Areas where potential spills that can contribute pollutants to storm water discharges can occur, and their accompanying drainage points shall be identified clearly in the storm water pollution prevention plan. Where appropriate, specifying material handling procedures, storage requirements, and use of equipment such as diversion valves in the plan should be considered. Procedures for cleaning up spills shall be identified in the plan and made available to the appropriate personnel. The necessary equipment to implement a clean up should be available to personnel.

(d) *Inspections.*—In addition to or as part of the comprehensive site evaluation required under paragraph XI.H.3.a.(4) of this section, qualified facility personnel shall be identified to inspect designated areas of the facility at appropriate intervals specified in the plan. The following shall be included in the plan:

- *Active mining-related areas and those inactive areas under SMCRA bond authority.*—The plan shall require quarterly inspections by the facility personnel for areas of the facility covered by pollution prevention plan requirements. This inspection interval corresponds with the quarterly inspections for the entire facility required to be provided by SMCRA authority inspectors for all mining-related areas under SMCRA authority, including sediment and erosion control measures. Inspections by the facility representative may be done at the same time as the mandatory inspections performed by SMCRA inspectors. At least one inspection shall be performed during a storm period of at least 0.1 inch rainfall where the effectiveness of the sediment and erosion control measures can be observed. During that inspection, a narrative evaluation of the control measures under storm conditions shall be made as well as visual impacts on the receiving stream. Records of inspections of the SMCRA authority facility representative shall be maintained.

- *Inactive mining-related areas not under SMCRA bond.*—The plan shall require annual inspections by the facility representative except in situations referred to in paragraph XI.H.3.a.(4)(d) below.

- *Inspection records.*—The plan shall require that inspection records of the facility representative and those of the SMCRA authority inspector shall be maintained. A set of tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections.

(e) *Employee training.*—Employee training programs shall inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise responsible for storm water management at all levels of responsibility of the components and goals of the storm water pollution prevention plan. Training should address topics such as spill response, good housekeeping and material management practices. A pollution prevention plan shall identify periodic dates for such training.

(f) *Recordkeeping and internal reporting procedures.*—A description of incidents (such as spills or other discharges) along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. Inspections and maintenance activities shall be documented and records of such activities shall be incorporated into the plan.

(g) *Non-storm water discharges.*—(i) The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges such as drainage from underground portions of inactive mines or floor drains from maintenance or coal handling buildings. The certification shall include the identification of potential significant sources of non-storm water discharges at the site, a description of the results of any test and/or evaluation, a description of the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit.

(ii) Except for flows from fire fighting activities, authorized sources of non-storm water listed in Part III.A.2. (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

(iii) Any facility that is unable to provide the certification required (testing or other evaluation for non-storm water discharges) must notify the Director by [270 days after permit issuance] or, for facilities that begin to discharge storm water associated with industrial activity after [insert date 270 days after permit issuance], 180 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform

adequate tests or evaluations, such notification shall describe: the procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water to the storm discharge lines; and why adequate tests for such storm discharge lines were not feasible. Non-storm water discharges to waters of the United States that are not authorized by an NPDES permit are unlawful, and must be terminated.

(h) *Sediment and erosion control*—The plan shall identify areas that, due to topography, activities, or other factors, have a high potential for significant soil erosion, and identify structural, vegetative, and/or stabilization measures to be used to limit erosion and reduce sediment concentrations in storm water discharges. As indicated in paragraph XI.H.3.a.(3) above, SMCRA requirements regarding sediment and erosion control measures are minimum requirements of the pollution prevention plan for mining-related areas subject to SMCRA authority. The following sediment and erosion control measures should be included in the plan where reasonable and appropriate for all areas subject to storm water runoff:

- *Stabilization measures*—Interim and permanent stabilization measures to minimize erosion and lessen amount of structural sediment control measures needed, including: Mature vegetation preservation; temporary seeding; permanent seeding and planting; temporary mulching, matting, and netting; sod stabilization; vegetative buffer strips; temporary chemical mulch, soil binders, and soil palliatives; nonacidic roadsurfacing material; and protective trees.

- *Structural measures*—Structural measures to lessen erosion and reduce sediment discharges, including: Silt fences; earth dikes; straw dikes; gradient terraces; drainage swales; sediment traps; pipe slope drains; porous rock check dams; sedimentation ponds; riprap channel protection; capping of contaminated sources; and physical/chemical treatment of storm water.

(i) *Management of flow*—The plan shall contain a narrative consideration of the appropriateness of traditional storm water management practices (other than those as sediment and erosion control measures listed above) used to manage storm water runoff in a manner that reduces pollutants in storm water runoff from the site. The plan shall provide that the measures, which the permittee determines to be reasonable and appropriate, shall be

implemented and maintained.

Appropriate measures may include: discharge diversions; drainage/storm water conveyances; runoff dispersion; sediment control and collection; vegetation/soil stabilization; capping of contaminated sources; and treatment.

(4) *Comprehensive site compliance evaluation*. Qualified personnel shall conduct site compliance evaluations at intervals specified in the plan, but in no case less than once a year. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with coal mining-related areas shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. These areas include haul and access roads; railroad spurs, sidings, and internal haulage lines; conveyor belts, chutes and aerial tramways; equipment storage and maintenance yards; coal handling buildings and structures; and inactive mines and related areas. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, and other structural pollution prevention measures, as indicated in paragraphs XI.H.3.a.(3)(h) and XI.H.3.a.(3)(i) above and where identified in the plan, shall be observed to ensure that they are operating correctly. A visual inspection of any equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the inspection, the description of potential pollutant sources identified in the plan, in accordance with paragraph XI.H.3.a.(2) of this section, and pollution prevention measures and controls identified in the plan, in accordance with paragraph XI.H.3.a.(3) of this section, shall be revised as appropriate within 2 weeks of such inspection and shall provide for implementation of any changes to the plan in a timely manner. For inactive mines, such revisions may be extended to a maximum of 12 weeks after the inspection.

(c) A report summarizing the scope of the inspection, personnel making the inspection, the date(s) of the inspection, major observations relating to the implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph XI.H.3.a.(4)(b) above shall be made and retained as part of the storm water pollution prevention plan for at least 1

year after coverage under this permit terminates. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) Where compliance evaluation schedules overlap with inspections required under 3.a.(3)(d), the compliance evaluation may be conducted in place of one such inspection. Where annual site inspections are shown in the plan to be impractical for inactive mining sites due to the remote location and inaccessibility of the site, site inspections required under this part shall be conducted at appropriate intervals specified in the plan, but, in no case less than once in 3 years.

4. *Numeric effluent limitations*. There are no additional numeric effluent limitations beyond those described in Part V. of this permit.

5. *Monitoring and reporting requirements*—a. *Monitoring requirements*—(1) *Quarterly visual examination of storm water quality*. Facilities shall perform and document a visual examination of a representative storm water discharge associated with industrial activity exposed to storm water. The examination must be made at least once in each designated period [described in (a), below] during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(a) Examinations shall be conducted in each of the following periods for the purposes of visually inspecting storm water quality associated with storm water runoff or snow melt: December to February; March to May; June to August; and September to November.

(b) Examinations shall be made of samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed one hour) of when the runoff or snowmelt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The inspection must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inch in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm

event. EPA expects that whenever practicable the same individual will carry out the collection and examination of discharges for the life of the permit.

When a discharger is unable to collect samples over the course of the monitoring period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricanes, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(c) Visual observation reports must be maintained onsite in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

(d) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the observation data also applies to the substantially identical outfalls provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explaining in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

When a discharger is unable to collect samples over the course of the monitoring period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel

(such as local flooding, high winds, hurricanes, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

I. Storm Water Discharges Associated With Industrial Activity From Oil and Gas Extraction Facilities

1. Discharges Covered Under This Section—*a. Eligibility.* This permit covers all existing point source discharges of storm water associated with industrial activity to waters of the United States from oil and gas facilities listed under Standard Industrial Classification (SIC) Major Group 13 which are required to be permitted under 40 CFR 122.26. Those industries in SIC Major Group 13 include the extraction and production of crude oil, natural gas, oil sands and shale; the production of hydrocarbon liquids and natural gas from coal; and associated oil field service, supply and repair industries.

When an industrial facility, described by the above eligibility provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

If monitoring and pollution prevention plan requirements of another industrial activity section of this permit apply to co-located industrial activities at an industrial facility, the eligibility provisions of that industrial activity section shall not preclude the operator of the industrial facility from complying with the applicable monitoring and pollution prevention plan requirements of that section.

2. Special Conditions

There are no additional requirements beyond those listed in Part III. of this permit.

3. Storm Water Pollution Prevention Plan Requirements

a. Contents of Plan. The plan shall include, at a minimum, the following items:

(1) ***Pollution Prevention Team.*** Each plan shall identify a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team that are responsible for developing the storm water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

(2) ***Description of Potential Pollutant Sources.*** Each plan shall provide a description of potential sources which may reasonably be expected to add significant amounts of pollutants to storm water discharges or which may result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. Each plan shall identify all activities and significant materials which may potentially be significant pollutant sources. Each plan shall include, at a minimum:

(a) Drainage.

(i) A site map indicating an outline of the portions of the drainage area of each storm water outfall that are within the facility boundaries, each existing structural control measure to reduce pollutants in storm water runoff, surface water bodies, locations where significant materials are exposed to precipitation, locations where major spills or leaks identified under Part IX.I.3.a.(1)(c) (Spills and Leaks) of this permit have occurred, location of the area where the RQ release occurred; and the locations of the following activities where such activities are exposed to precipitation: Fueling stations, vehicle and equipment maintenance and/or cleaning areas, loading/unloading areas, locations used for the treatment, storage or disposal of wastes, liquid storage tanks, processing areas and storage areas, chemical mixing areas, construction and drilling areas. The site map will indicate all areas subject to the effluent guidelines requirement of "No Discharge" in accordance with 40 CFR 435.32 and the existing structural controls to achieve compliance with the "No Discharge" requirement.

(ii) For each area of the facility that generates storm water discharges associated with industrial activity with a reasonable potential for containing significant amounts of pollutants, a prediction of the direction of flow, and an identification of the types of pollutants which are likely to be present in storm water discharges associated with industrial activity. Factors to

consider include the toxicity of chemical; quantity of chemicals used, produced or discharged; the likelihood of contact with storm water; and history of significant leaks or spills of toxic or hazardous pollutants. The permittee should consider the cause of RQ releases, the materials used to contain and remediate releases, and any other aspect of releases or clean-up which could potentially contribute pollutants to a storm water discharge. Flows with a significant potential for causing erosion shall be identified.

(b) Inventory of Exposed Materials—An inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such inventory shall include a narrative description of significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of 3 years prior to the date of the issuance of this permit and the present; method and location of onsite storage or disposal; materials management practices employed to minimize contact of materials with storm water runoff between the time of 3 years prior to the date of the issuance of this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of any treatment the storm water receives.

(c) Spills and Leaks—A list of significant spills and significant leaks of toxic or hazardous pollutants that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility after the date of 3 years prior to the effective date of this permit. Such list shall be updated as appropriate during the term of the permit.

(d) Sampling Data—A summary of existing discharge sampling data describing pollutants in storm water discharges from the facility, including a summary of sampling data collected during the term of this permit.

(e) Risk Identification and Summary of Potential Pollutant Sources—A narrative description of the potential pollutant sources from the following activities: Loading and unloading operations; outdoor storage activities; chemical, cement, mud or gel mixing activities; outdoor manufacturing or processing activities; drilling or mining activities; significant dust or particulate generating processes; and onsite waste disposal practices, equipment cleaning and rehabilitation activities. List any significant potential source of pollutants at the site and for each potential source, any pollutant or pollutant parameter

(e.g., biochemical oxygen demand, etc.) of concern shall be identified.

In its description of potential pollutant sources, a facility must include information about the RQ release which triggered the permit application requirements. Such information must include: the nature of the release (e.g., spill of oil from a drum storage area); the amount of oil or hazardous substance released; amount of substance recovered; date of the release; cause of the release (e.g., poor handling techniques as well as lack of containment in area); area affected by release, including land and waters; procedure to cleanup release; actions or procedures implemented to prevent or better respond to a release; and remaining potential contamination of storm water from release. The analysis shall take into account human health risks, the control of drinking water intakes, and the designated uses of the receiving stream.

(3) Measures and Controls. Each facility covered by this permit shall develop and implement storm water management controls appropriate for the facility. The controls in a plan shall reflect identified potential sources of pollutants at the facility. The description of storm water management controls shall address the following minimum components, including a schedule for implementing such measures:

(a) Good Housekeeping—Good housekeeping requires the maintenance of areas which may contribute pollutants to storm water discharges in a clean, orderly manner.

(b) Preventive Maintenance—A preventive maintenance program shall involve timely inspection and maintenance of storm water management devices (e.g., cleaning oil/water separators, catch basins) as well as inspecting and testing facility equipment and systems to uncover conditions that could cause breakdowns or failures resulting in discharges of pollutants to surface waters, and ensuring appropriate maintenance of such equipment and systems. The preventative maintenance program shall also include the inspection of all on site and off site mixing tanks and equipment, and all vehicles which carry supplies and chemicals to oil field activities.

(c) Spill Prevention and Response Procedures—Areas where potential spills which can contribute pollutants to storm water discharges can occur, and their accompanying drainage points shall be identified clearly in the storm water pollution prevention plan. Materials shall be stored indoors where

possible, and drainage systems designed to discharge downstream from drinking water intakes. Where appropriate, specifying material handling procedures, storage requirements, and use of equipment such as diversion valves in the plan should be considered. Procedures for cleaning up spills shall be identified in the plan and made available to the appropriate personnel. The necessary equipment to implement a clean up should be available to personnel.

(d) Inspections—In addition to or as part of the comprehensive site evaluation required under paragraph XI.1.3.a.(4) of this section, qualified facility or plant personnel shall be identified to inspect designated equipment and areas of the facility at appropriate intervals specified in the plan. All equipment and areas addressed in the pollution prevention plan shall be inspected at a minimum of 6-month intervals. Equipment and vehicles which store, mix or transport hazardous materials will be inspected routinely, but not less than quarterly. A set of tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections. Records of inspections shall be maintained.

(e) Employee Training—Employee training programs shall inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise responsible for storm water management at all levels of responsibility of the components and goals of the storm water pollution prevention plan. Training should address topics such as spill response, good housekeeping and material management practices. A pollution prevention plan shall identify periodic dates for such training.

(f) Recordkeeping and Internal Reporting Procedures—A description of incidents (such as spills, or other discharges), along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. Inspections and maintenance activities shall be documented and records of such activities shall be incorporated into the plan. All records shall be kept for a period of not less than 3 years.

(g) Non-storm Water Discharges.

(i) The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test

and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit. Such certification may not be feasible if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit which receives the discharge. In such cases, the source identification section of the storm water pollution plan shall indicate why the certification required by this part was not feasible, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with paragraph XI.I.a.(3)(g)(iii) (below).

(ii) Except for flows from fire fighting activities, sources of non-storm water listed in Part III.A. (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

(iii) *Failure to Certify*—Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director by [insert date 270 days after permit issuance] or, for facilities which begin to discharge storm water associated with industrial activity after [insert date 270 days after permit issuance], 180 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: the procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States which are not authorized by an NPDES permit are unlawful, and must be terminated.

(h) *Sediment and Erosion Control*—The plan shall identify areas which, due to topography, activities, or other factors, have a high potential for significant soil erosion, and identify structural, vegetative, and/or stabilization measures to be used to

limit erosion. Unless covered by the General Permit for Construction Activity (57 FR 41209), the additional erosion control requirement for well drillings oil, sand, and shale mining areas are as follows:

(i) *Site Description*—Each plan shall provide a description of the following: 1) a description of the nature of the exploration activity; 2) estimates of the total area of the site and the area of the site that is expected to be disturbed due to the exploration activity; 3) an estimate of the runoff coefficient of the site; 4) a site map indicating drainage patterns and approximate slopes, the location of major control structures identified in the plan, and surface waters; and 5) the name of the receiving water(s) and the ultimate receiving water(s) of the runoff.

(ii) *Controls*—The pollution prevention plan shall include a description of controls appropriate for the activity and implement such controls. The description of controls shall address the following minimum components:

- A description of vegetative practices designed to preserve existing vegetation where attainable and revegetate open areas as soon as practicable after grade drilling. Such practices may include: temporary seeding, permanent seeding, mulching, sod stabilization, vegetative buffer strips, and protection of trees. The operator shall initiate appropriate vegetative practices on all disturbed areas within 14 calendar days of the last activity at that area.

- A description of structural practices to the degree attainable divert flows from exposed soils, store flows or otherwise limit runoff from exposed areas of the site. Such practices may include straw bale dikes, silt fences, earth dikes, brush barriers, drainage swales, check dams, subsurface drain, pipe slope drain, level spreaders storm drain inlet protection, rock outlet protection, sediment traps, and temporary sediment basins.

(iii) Offsite vehicle tracking of sediments shall be minimized.

(iv) Procedures in a plan shall provide that all erosion controls on the site are inspected at least once every 7 calendar days.

(i) *Management of Runoff*—The plan shall contain a narrative consideration of the appropriateness of traditional storm water management practices (practices other than those which control the generation or source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges

from the site. The plan shall provide the measures that the permittee determines to be reasonable and appropriate which shall be implemented and maintained. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity shall be considered when determining reasonable and appropriate measures. Appropriate measures may include: vegetative swales and practices, reuse of collected storm water (such as for a process or as an irrigation source), inlet controls (such as oil/water separators), snow management activities, infiltration devices, and wet detention/retention devices.

(j) *RQ Release*—The permittee must describe the measures taken to clean up RQ releases or related spills of materials, as well as measures proposed to avoid future releases of RQs. Such measures may include, among others: improved handling or storage techniques; containment around handling areas of liquid materials; and use of improved spill cleanup materials and techniques.

(k) *Vehicle and Equipment Storage Areas*—The storage of vehicles and equipment awaiting or having completed maintenance must be confined to designated areas (delineated on the site map). The plan must describe measures that prevent or minimize contamination of the storm water runoff from these areas. The facility may consider the use of drip pans under vehicles and equipment, indoor storage of the vehicles and equipment, and/or installation of berming and diking of this area.

(l) *Vehicle and Equipment Cleaning and Maintenance Areas*—The plan must describe measures that prevent or minimize contamination of the storm water runoff from all areas used for vehicle and equipment cleaning. The facility may consider performing all cleaning operations indoors, covering the cleaning operation, ensuring that all washwaters drain to a sanitary sewer, and/or collecting the storm water runoff from the cleaning area and providing treatment or recycling. The discharge of vehicle and equipment wash waters, including tank cleaning operations, are not authorized by this permit and must be authorized under a separate NPDES permit or discharged to a sanitary sewer in accordance with applicable industrial pretreatment requirements.

The plan must describe measures that prevent or minimize contamination of the storm water runoff from all areas used for vehicle and equipment maintenance and rehabilitation. The facility may consider performing all

maintenance activities indoors, use of drip pans, maintaining an organized inventory of materials used in the shop, draining all parts of fluids prior to disposal, prohibiting the practice of hosing down the shop floor where the practice would result in the exposure of pollutants to storm water, using dry cleanup methods, and/or collecting the storm water runoff from the maintenance area and providing treatment or recycling.

(m) Materials and Chemical Storage Areas—Storage units of all chemicals and materials (e.g., fuels, oils, used filters, spent solvents, paint wastes, radiator fluids, transmission fluids, hydraulic fluids, detergents drilling mud components, acids, organic additives) must be maintained in good condition so as to prevent contamination of storm water. Hazardous materials must be plainly labeled. The plan must describe measures that prevent or minimize contamination of the storm water runoff from such storage areas. The facility may consider indoor storage of the materials and/or installation of berming and diking at the area.

(n) Chemical Mixing Areas—The plan must describe measures that prevent or minimize contamination of the storm water runoff from chemical mixing areas. The facility may consider covering the mixing area, using spill and overflow protection, minimizing runoff of storm water to the mixing area, using dry cleanup methods, and/or collecting the storm water runoff and providing treatment or recycling. The facility may consider installation of berming and diking of the area.

(4) Comprehensive Site Compliance Evaluation. Qualified personnel shall conduct site compliance evaluations at appropriate intervals specified in the plan, but in no case less than once a year. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with industrial activity (e.g., materials and chemical storage areas, vehicle and equipment cleaning and maintenance areas, vehicle and equipment storage areas, chemical mixing areas, and areas of materials handling at the drill site areas) shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, and other structural pollution

prevention measures identified in the plan shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the inspection, the description of potential pollutant sources identified in the plan in accordance with paragraph XI.I.3.a.(2) of this section (Description of Potential Pollutant Sources) and pollution prevention measures and controls identified in the plan in accordance with paragraph XI.I.3.a.(3) of this section (Measures and Controls) shall be revised as appropriate within 2 weeks of such inspection and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the inspection.

(c) A report summarizing the scope of the inspection, personnel making the inspection, the date(s) of the inspection, and major observations relating to the implementation of the storm water pollution prevention plan the permit shall be made and retained as part of the storm water pollution prevention plan for at least 1 year after coverage under this permit terminates. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) Where compliance evaluation schedules overlap with inspections required under 3.a.(3)(d), the compliance evaluation may be conducted in place of one such inspection.

4. Numeric Effluent Limitations. There are no additional requirements beyond those listed in Part V. of this permit.

5. Monitoring and Reporting Requirements

a. Monitoring Requirements.

(1) Quarterly Visual Examination of Storm Water Quality. Facilities shall perform and document a visual examination of a representative storm water discharge associated with industrial activity exposed to storm water. The examination must be made at least once in each designated period [described in (a), below] during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(a) Examinations shall be conducted in each of the following periods for the

purposes of visually inspecting storm water quality associated with storm water runoff or snow melt: December to February; March to May; June to August; and September to November.

(b) Examinations shall be made of samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed one hour) of when the runoff or snowmelt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The inspection must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. EPA expects that whenever practicable the same individual will carry out the collection and examination of discharges for the life of the permit.

(c) Visual observation reports must be maintained onsite in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

(d) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the observation data also applies to the substantially identical outfalls provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explaining in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

When a discharger is unable to collect samples over the course of the monitoring period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

J. Storm Water Discharges Associated With Industrial Activity From Mineral Mining and Processing Facilities

1. Discharges Covered Under This Section

a. Eligibility.

(1) This permit covers all existing point source discharges of storm water associated with industrial activity to waters of the United States from active and inactive mineral mining and processing facilities, generally identified by Standard Industrial Classification (SIC) Major Group 14, except for storm water discharges identified under paragraph XI.J.1.b.

(2) This permit may authorize storm water discharges associated with industrial activity that are mixed with storm water discharges associated with industrial activity from construction activities, provided that the storm water discharge from the construction activity is in compliance with the terms, including applicable Notice of Intent (NOI) or application requirements, of a different NPDES general permit or individual permit authorizing such discharges.

(b) Limitations on Coverage. The following storm water discharges associated with industrial activity are not authorized by this permit:

(1) Storm water discharges associated with industrial activity which are subject to an existing effluent limitation guideline, 40 CFR Part 436.

(2) Co-located Industrial Activities:

When an industrial facility, described by the above eligibility provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for

industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

If monitoring and pollution prevention plan requirements of another industrial activity section of this permit apply to co-located industrial activities at an industrial facility, the eligibility provisions of that industrial activity section shall not preclude the operator of the industrial facility from complying with the applicable monitoring and pollution prevention plan requirements of that section.

2. Special Conditions

a. Prohibition of Non-storm Water Discharges. This section of today's proposed permit does not cover any discharge subject to process wastewater effluent limitation guidelines, including storm water that combines with process wastewater.

3. Storm Water Pollution Prevention Plan Requirements

a. Contents of Plan. The plan shall include at a minimum, the following items:

(1) **Pollution Prevention Team.** Each plan shall identify a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team that are responsible for developing the storm water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

(2) **Description of Potential Pollutant Sources.** Each storm water pollution prevention plan must describe industrial activities, significant materials, and physical features of the facility that may contribute to storm water runoff or, during periods of dry weather, result in dry weather flows and mine pumpout. Plans must describe the following elements:

(a) **Drainage**—The plan must contain a map of the site that shows the pattern of storm water drainage, structural or nonstructural features that control pollutants in storm water runoff and process wastewater discharges, surface water bodies (including wetlands), places where significant materials are exposed to rainfall and runoff, and locations of major spills and leaks that occurred in the 3 years prior to the

effective date of this permit. The map also must show areas where the following activities take place: fueling, vehicle and equipment maintenance and/or cleaning, loading and unloading, material storage (including tanks or other vessels used for liquid or waste storage), material processing, and waste disposal, haul roads, access roads, and rail spurs. In addition, the site map must also identify monitoring locations, if monitoring is required for the facility.

(b) **Inventory of Exposed Materials**—Facility operators are required to carefully conduct an inspection of the site and related records to identify significant materials that are or may be exposed to storm water. The inventory must address materials that within 3 years prior to the effective date of the permit have been handled, stored, processed, treated, or disposed of in a manner to allow exposure to storm water. Findings of the inventory must be documented in detail in the pollution prevention plan. At a minimum, the plan must describe the method and location of onsite storage or disposal; practices used to minimize contact of materials with rainfall and runoff; existing structural and nonstructural controls that reduce pollutants in storm water runoff; existing structural controls that limit process wastewater discharges; and any treatment the runoff receives before it is discharged to surface waters or a separate storm sewer system. The description must be updated whenever there is a significant change in the types or amounts of materials, or material management practices, that may affect the exposure of materials to storm water.

(c) **Significant Spills and Leaks**—The plan must include a list of any significant spills and leaks of toxic or hazardous pollutants that occurred in the 3 years prior to the effective date of the permit. Significant spills include, but are not limited to, releases of oil or hazardous substances in excess of quantities that are reportable under Section 311 of CWA (see 40 CFR 110.10 and 117.21) or Section 102 of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) (see 40 CFR 302.4). Significant spills may also include releases of oil or hazardous substances that are not in excess of reporting requirements and releases of materials that are not classified as oil or a hazardous substance.

(d) **Sampling Data**—Any existing data on the quality or quantity of storm water discharges from the facility must be described in the plan. The description should include a discussion of the methods used to collect and analyze the

data. Sample collection points should be identified in the plan and shown on the site map.

(e) Risk Identification and Summary of Potential Pollutant Sources—The description of potential pollution sources culminates in a narrative assessment of the risk potential that sources of pollution pose to storm water quality. This assessment should clearly point to activities, materials, and physical features of the facility that have a reasonable potential to contribute significant amounts of pollutants to storm water. Any such industrial activities, significant materials, or features must be addressed by the measures and controls subsequently described in the plan. In conducting the assessment, the facility operator must consider the following activities: loading and unloading operations; outdoor storage activities; outdoor processing activities; significant dust or particulate generating processes; and onsite waste disposal practices. The assessment must list any significant pollution sources at the site and identify the pollutant parameter or parameters (i.e., total suspended solids, total dissolved solids, etc.) associated with each source.

(3) Measures and Controls. Following completion of the source identification and assessment phase, the permittee must evaluate, select, and describe the pollution prevention measures, best management practices (BMPs), and other controls that will be implemented at the facility. The permittee must assess the applicability of the following BMPs for their site: discharge diversions, drainage/storm water conveyance systems, runoff dispersions, sediment control and collection mechanisms, vegetation/soil stabilization, and capping of contaminated sources. In addition, BMPs include processes, procedures, schedules of activities, prohibitions on practices, and other management practices that prevent or reduce the discharge of pollutants in storm water runoff.

The pollution prevention plan must discuss the reasons each selected control or practice is appropriate for the facility and how each will address the potential sources of storm water pollution. The plan also must include a schedule specifying the time or times during which each control or practice will be implemented. In addition, the plan should discuss ways in which the controls and practices relate to one another and, when taken as a whole, produce an integrated and consistent approach for preventing or controlling potential storm water contamination problems.

(a) Good Housekeeping—Good housekeeping requires the maintenance of areas which may contribute pollutants to storm waters discharges in a clean, orderly manner.

(b) Preventive Maintenance—The maintenance program requires periodic removal of debris from discharge diversions and conveyance systems. These activities should be conducted in the spring, after snowmelt, and during the fall season. Permittees using ponds to control their effluents frequently use impoundments or sedimentation ponds as their BAT/BCT. Maintenance schedules for these ponds must be provided in the pollution prevention plan.

(c) Spill Prevention and Response Procedures—Areas where potential spills which can contribute pollutants to storm water discharges can occur, and their accompanying drainage points shall be identified clearly in the storm water pollution prevention plan. Where appropriate, specifying material handling procedures, storage requirements, and use of equipment such as diversion valves in the plan should be considered. Procedures for cleaning up spills shall be identified in the plan and made available to the appropriate personnel. The necessary equipment to implement a clean up should be available to personnel.

(d) Inspections—Operators of active facilities are required to conduct quarterly visual inspections of all BMPs. Temporarily and permanently inactive operations are required to perform annual inspections. The inspections shall include: (1) an assessment of the integrity of storm water discharge diversions, conveyance systems, sediment control and collection systems, and containment structures; (2) visual inspections of vegetative BMPs, serrated slopes, and benched slopes to determine if soil erosion has occurred; and (3) visual inspections of material handling and storage areas and other potential sources of pollution for evidence of actual or potential pollutant discharges of contaminated storm water.

The examination must be made at least once in each designated period during daylight hours unless there is insufficient rainfall or snow-melt to produce a runoff event. Examinations shall be conducted in each of the following periods for the purposes of inspecting storm water quality associated with storm water runoff and snow melt: December to February (storm water runoff or snow melt); March to May (storm water runoff); June to August (storm water runoff); September to November (storm water runoff or snow melt).

(e) Employee Training—Employee training programs shall inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise responsible for storm water management at all levels of responsibility of the components and goals of the storm water pollution prevention plan. Training should address topics such as spill response, good housekeeping and material management practices. The pollution prevention plan shall identify periodic dates for such training.

(f) Recordkeeping and Internal Reporting Procedures—A description of incidents such as spills or other discharges along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. The permittee must describe procedures for developing and retaining records on the status and effectiveness of plan implementation. The plan must address spills, monitoring, and BMP inspection and maintenance activities. Ineffective BMPs must be recorded and the date of their corrective action noted.

(g) Non-storm Water Discharges.

(i) The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with part VII.G. of this permit. Such certification may not be feasible if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit which receives the discharge. In such cases, the source identification section of the storm water pollution plan shall indicate why the certification required by this part was not feasible, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with part XI.J.3.a.(g)(iii) (Failure to Certify) of this permit.

(ii) Except for flows from fire fighting activities, sources of non-storm water listed in Part III.A. (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water

discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

(iii) *Failure to Certify*.—Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director by [Insert date 270 days after permit issuance] or, for facilities which begin to discharge storm water associated with industrial activity after [Insert date 270 days after permit issuance], 180 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe the procedure of any test conducted for the presence of non-storm water discharges to the storm sewer and why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States which are not authorized by an NPDES permit are unlawful and must be terminated.

(h) *Sediment and Erosion Control*.—The plan shall identify areas which, due to topography, activities, or other factors, have a high potential for significant soil erosion, and identify structural, vegetative, and/or stabilization measures to be used to limit erosion.

Permittees must indicate the location and design for proposed BMPs to be implemented prior to land disturbance activities. For sites already disturbed but without BMPs, the permittee must indicate the location and design of BMPs that will be implemented. The permittee is required to indicate plans for grading, contouring, stabilization, and establishment of vegetative cover for all disturbed areas, including road banks. Reclamation activities must continue until final closure notice has been issued.

(i) *Management of Runoff*.—The plan shall contain a narrative consideration of the appropriateness of traditional storm water management practices (practices other than those which control the generation or source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. The plan shall provide that measures that the permittee determines to be reasonable and appropriate shall be implemented and maintained. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity [see

Part XI.J.3.a.(2) (Description of Potential Pollutant Sources) of this permit] shall be considered when determining reasonable and appropriate measures. Appropriate measures may include: vegetative swales and practices, reuse of collected storm water (such as for a process or as an irrigation source), inlet controls (such as oil/water separators), snow management activities, infiltration devices, and wet detention/retention devices. In addition, the permittee must describe the storm water pollutant source area or activity (i.e., loading and unloading operations, raw material storage piles etc.) to be controlled by each storm water management practice.

(4) *Comprehensive Site Compliance Evaluation*. Qualified personnel shall conduct site compliance evaluations at appropriate intervals specified in the plan, but, in no case less than once a year. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with industrial activity shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, and other structural pollution prevention measures identified in the plan shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the inspection, the description of potential pollutant sources identified in the plan in accordance with Part XI.J.3.a.(2) (Description of Potential Pollutant Sources) of this permit and pollution prevention measures and controls identified in the plan in accordance with paragraph XI.J.3.a.(3) (Measures and Controls) of this permit shall be revised as appropriate within 2 weeks of such inspection and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the inspection.

(c) A report summarizing the scope of the inspection, personnel making the inspection, the date(s) of the inspection, major observations relating to the implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph XI.J.3.a.(4)(b) (above) of the permit shall be made and retained as part of the storm water pollution prevention plan

for at least 1 year after coverage under this permit terminates. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) The storm water pollution prevention plan must describe the scope and content of comprehensive site inspections that qualified personnel will conduct to 1) confirm the accuracy of the description of potential pollution sources contained in the plan, 2) determine the effectiveness of the plan, and 3) assess compliance with the terms and conditions of the permit.

Comprehensive site compliance evaluations should be conducted twice a year for active facilities and once a year for temporary and permanently inactive sites. The individual or individuals who will conduct the inspections must be identified in the plan and should be members of the pollution prevention team. Inspection reports must be retained for at least 3 years after the date that the permit expires. Where compliance evaluation schedules overlap with inspections required under 3.a.(3)(d), the compliance evaluation may be conducted in place of one such inspection.

Based on the results of each inspection, the description of potential pollution sources, and measures and controls, the plan must be revised as appropriate within 2 weeks after each inspection. Changes in the measures and controls must be implemented on the site in a timely manner, and never more than 12 weeks after completion of the inspection.

4. Numeric Effluent Limitations

There are no additional numeric effluent limitations beyond those described in Part V. of this permit.

5. Monitoring and Reporting Requirements

a. Monitoring Requirements.

(1) *Quarterly Visual Examination of Storm Water Quality*. Facilities shall perform and document a visual examination of a representative storm water discharge associated with industrial activity exposed to storm water. The examination must be made at least once in each designated period [described in (a), below] during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(a) Examinations shall be conducted in each of the following periods for the purposes of visually inspecting storm water quality associated with storm water runoff or snow melt: December to February; March to May; June to August; and September to November.

(b) Examinations shall be made of samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed one hour) of when the runoff or snowmelt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The inspection must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. EPA expects that whenever practicable the same individual will carry out the collection and examination of discharges for the life of the permit.

When a discharger is unable to collect samples over the course of the monitoring period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(c) Visual observation reports must be maintained onsite in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

(d) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such

outfalls and report that the observation data also applies to the substantially identical outfalls provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explaining in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

K. Storm Water Discharges Associated With Industrial Activity From Hazardous Waste Treatment, Storage, or Disposal Facilities

1. Discharges Covered Under This Section. The requirements listed under this section shall apply to storm water discharges associated with industrial activity from facilities that treat, store, or dispose of hazardous wastes, including those that are operating under interim status or a permit under subtitle C of RCRA.

When an industrial facility, described by the above eligibility provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

If monitoring and pollution prevention plan requirements of another industrial activity section of this permit apply to co-located industrial activities at an industrial facility, the eligibility provisions of that industrial activity section shall not preclude the operator of the industrial facility from complying with the applicable monitoring and pollution prevention plan requirements of that section.

2. Special Conditions

a. Prohibition of Non-storm Water Discharges. There are no additional requirements under this section other than those stated in Part III.A.

3. Storm Water Pollution Prevention Plan Requirements. Where a requirement under this section of the permit is similar to a requirement which the facility is subject to under RCRA, the facility must comply with the more stringent of the two conditions and report such conditions in the applicable section of the storm water pollution prevention plan.

a. Contents of Plan. The plan shall include, at a minimum, the following items:

(1) Pollution Prevention Team. Each plan shall identify a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team that are responsible for developing the storm water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

(2) Description of Potential Pollutant Sources. Each plan shall provide a description of potential sources which may reasonably be expected to add significant amounts of pollutants to storm water discharges or which may result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. Each plan shall identify all activities and significant materials which may potentially be significant pollutant sources. Each plan shall include, at a minimum:

a. Drainage.

(i) A site map indicating an outline of the portions of the drainage area of each storm water outfall that are within the facility boundaries, each existing structural control measure to reduce pollutants in storm water runoff, surface water bodies, locations where significant materials are exposed to precipitation, locations where major spills or leaks identified under part IV.D.3.c. (Spills and Leaks) of this permit have occurred, and the locations of the following activities where such activities are exposed to precipitation: fueling stations, vehicle and equipment maintenance and/or cleaning areas, loading/unloading areas, locations used for the treatment, storage or disposal of wastes, liquid storage tanks, processing areas and storage areas.

(ii) For each area of the facility that generates storm water discharges associated with industrial activity with a reasonable potential for containing significant amounts of pollutants, a prediction of the direction of flow, and

an identification of the types of pollutants which are likely to be present in storm water discharges associated with industrial activity. Factors to consider include the toxicity of chemical; quantity of chemicals used, produced or discharged; the likelihood of contact with storm water; and history of significant leaks or spills of toxic or hazardous pollutants. Flows with a significant potential for causing erosion shall be identified.

(b) Inventory of Exposed Materials—An inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such inventory shall include a narrative description of significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of 3 years prior to the date of the issuance of this permit and the present; method and location of onsite storage or disposal; materials management practices employed to minimize contact of materials with storm water runoff between the time of 3 years prior to the date of the issuance of this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of any treatment the storm water receives.

(c) Spills and Leaks—A list of significant spills and significant leaks of toxic or hazardous pollutants that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility after the date of 3 years prior to the effective date of this permit. Such list shall be updated as appropriate during the term of the permit.

(d) Sampling Data—A summary of existing discharge sampling data describing pollutants in storm water discharges from the facility, including a summary of sampling data collected during the term of this permit.

(e) Risk Identification and Summary of Potential Pollutant Sources—A narrative description of the potential pollutant sources from the following activities: loading and unloading operations; outdoor storage activities; outdoor processing activities; significant dust or particulate generating processes; and onsite waste disposal practices. The description shall specifically list any significant potential source of pollutants at the site and for each potential source, any pollutant or pollutant parameter (e.g., chemical oxygen demand, etc.) of concern shall be identified.

(3) Measures and Controls. Each facility covered by this permit shall develop a description of storm water

management controls appropriate for the facility, and implement such controls. The appropriateness and priorities of controls in a plan shall reflect identified potential sources of pollutants at the facility. The description of storm water management controls shall address the following minimum components, including a schedule for implementing such controls:

(a) Good Housekeeping—Good housekeeping requires the maintenance of areas which may contribute pollutants to storm water discharges in a clean, orderly manner.

(b) Preventive Maintenance—A preventive maintenance program shall involve timely inspection and maintenance of storm water management devices (e.g., berms, catch basins) as well as inspecting and testing facility equipment and systems to uncover conditions that could cause breakdowns or failures resulting in discharges of pollutants to surface waters, and ensuring appropriate maintenance of such equipment and systems.

(c) Spill Prevention and Response Procedures—Areas where potential spills which can contribute pollutants to storm water discharges can occur, and their accompanying drainage points shall be identified clearly in the storm water pollution prevention plan. Where appropriate, specifying material handling procedures, storage requirements, and use of equipment such as diversion valves in the plan should be considered. Procedures for cleaning up spills shall be identified in the plan and made available to the appropriate personnel. The necessary equipment to implement a clean up should be available to personnel.

(d) Inspections—In addition to or as part of the comprehensive site evaluation required under paragraph XI.K.3.a.(4) of this section, qualified facility personnel shall be identified to inspect designated equipment and areas of the facility at appropriate intervals specified in the plan. A set of tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections. Records of inspections shall be maintained.

(e) Employee Training—Employee training programs shall inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise responsible for storm water management at all levels of responsibility of the components and goals of the storm water pollution prevention plan. Training should address topics such as

spill response, good housekeeping and material management practices. A pollution prevention plan shall identify periodic dates for such training.

(f) Recordkeeping and Internal Reporting Procedures—A description of incidents (such as spills, or other discharges), along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. Inspections and maintenance activities shall be documented and records of such activities shall be incorporated into the plan.

(g) Non-storm Water Discharges.

(i) The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with part VII.G. of this permit. Such certification may not be feasible if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit which receives the discharge. In such cases, the source identification section of the storm water pollution plan shall indicate why the certification required by this part was not feasible, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with paragraph (iii) (below).

(ii) Except for flows from fire fighting activities, sources of non-storm water listed in part III.A. (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

(iii) Failure to Certify—Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director by [Insert date 270 days after permit issuance] or, for facilities which begin to discharge storm water associated with industrial activity after [Insert date 270 days after permit

issuance), 180 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: the procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States which are not authorized by an NPDES permit are unlawful, and must be terminated.

(h) *Sediment and Erosion Control*—The plan shall identify areas which, due to topography, activities, or other factors, have a high potential for significant soil erosion, and identify structural, vegetative, and/or stabilization measures to be used to limit erosion.

(i) *Management of Runoff*—The plan shall contain a narrative consideration of the appropriateness of traditional storm water management practices (practices other than those which control the generation or source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. The plan shall provide that measures that the permittee determines to be reasonable and appropriate shall be implemented and maintained. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity [see paragraph XI.K.3.a.(2) of this section (Description of Potential Pollutant Sources)] shall be considered when determining reasonable and appropriate measures. Appropriate measures may include: vegetative swales and practices, reuse of collected storm water (such as for a process or as an irrigation source), inlet controls (such as oil/water separators), snow management activities, infiltration devices, and wet detention/retention devices.

(4) *Comprehensive Site Compliance Evaluation*. Qualified personnel shall conduct site compliance evaluations at appropriate intervals specified in the plan but in no case less than once a year. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with industrial activity shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in

accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, and other structural pollution prevention measures identified in the plan shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the inspection, the description of potential pollutant sources identified in the plan in accordance with paragraph XI.K.3.a.(2) of this section (Description of Potential Pollutant Sources) and pollution prevention measures and controls identified in the plan in accordance with paragraph XI.K.3.a.(3) of this section (Measures and Controls) shall be revised as appropriate within 2 weeks of such inspection and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the inspection.

(c) A report summarizing the scope of the inspection, personnel making the inspection, the date(s) of the inspection, major observations relating to the implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph (4)(b) (above) of the permit shall be made and retained as part of the storm water pollution prevention plan for at least 1 year after coverage under this permit terminates. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) Where compliance evaluation schedules overlap with inspections required under 3.a.(3)(d), the compliance evaluation may be conducted in place of one such inspection.

4. Numeric Effluent Limitations

There are no additional numeric effluent limitations beyond those in Part V. of this permit.

5. Monitoring and Reporting Requirements

a. *Analytical Monitoring Requirements*. During the period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] and

the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance], permittees with hazardous waste treatment, storage, or disposal facilities (TSDFs) must monitor their storm water discharges associated with industrial activity at least quarterly (4 times per year) except as provided in paragraphs 5.a.(3) (Sampling Waiver), 5.a.(4) (Representative Discharge), and 5.a.(5) (Alternative Certification). TSDFs are required to monitor their storm water discharges for the pollutants of concern listed in Table K-1 below. Facilities must report in accordance with 5.b. (Reporting). In addition to the parameters listed in Table K-1 below, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event that generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

TABLE K-1.—INDUSTRY MONITORING REQUIREMENTS

| Pollutants of concern | Cut-off concentration |
|--------------------------------|-----------------------|
| Ammonia | .093 mg/L. |
| Total Kjeldahl Nitrogen (TKN) | 1.5 mg/L. |
| Total Recoverable Magnesium | detection limit. |
| Chemical Oxygen Demand (COD). | 65 mg/L. |
| Arsenic | 0.000018 mg/L. |
| Total Recoverable Barium | 1.0 mg/L. |
| Total Recoverable Cadmium | 0.0018 mg/L. |
| Cyanide | detection limit. |
| Total Recoverable Lead | 0.0337 mg/L. |
| Mercury | 0.0024 mg/L. |
| Total Recoverable Selenium .. | 0.02 mg/L. |
| Total Recoverable Silver | 0.0009 mg/L. |

(1) *Monitoring Periods*. TSDFs shall monitor samples collected during the sampling periods of: January to March, April to June, July to September, and October to December for the years specified in paragraph a. (above).

(2) *Sample Type*. A minimum of one grab sample shall be taken. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab

sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable. If storm water discharges associated with industrial activity commingle with process or nonprocess water, then where practicable permittees must attempt to sample the storm water discharge before it mixes with the non-storm water discharge.

(3) Sampling Waiver

(a) Adverse Conditions—When a discharger is unable to collect samples during one of the monitoring periods specified in paragraph b. (Monitoring Periods) because of adverse climatic conditions, the discharger may collect two samples from the two separate qualifying events in the next monitoring period and submit this data. Adverse weather conditions that may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(b) Low Concentration Waiver—When the average concentration for a pollutant calculated from all monitoring data collected from an outfall during the monitoring period [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] is less than the corresponding value for that pollutant listed in Table K-1 under the column Monitoring Cut-off Concentration, a facility may waive monitoring and reporting requirements in the monitoring period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance]. The facility must submit to the Director, in lieu of the monitoring data, a certification that there has not been a significant change in industrial activity or the pollution prevention measures in area of the facility which drains to the outfall for which sampling was waived.

(4) Representative Discharge. When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may test the effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfall(s) provided that the permittee

includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan. The permittee shall include the description of the location of the outfalls, explanation of why outfalls are expected to discharge substantially identical effluents, and estimate of the size of the drainage area and runoff coefficient with the Discharge Monitoring Report.

(5) Alternative Certification. A discharger is not subject to the monitoring requirements of this section provided the discharger makes a certification for a given outfall, on an annual basis, under penalty of law, signed in accordance with Part VII.G. (Signatory Requirements), that material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, industrial machinery or operations, or significant materials from past industrial activity that are located in areas of the facility within the drainage area of the outfall are not presently exposed to storm water and are not expected to be exposed to storm water for the certification period. Such certification must be retained in the storm water pollution prevention plan, and submitted to EPA in accordance with Part VI.B. of this permit.

b. Reporting. Permittees with TSDFs shall submit monitoring results for each outfall associated with industrial activity [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the reporting period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March [insert the date 2 years after permit issuance]. Monitoring results [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance] shall be submitted on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March. A separate Discharge Monitoring Report Form is required for each quarterly sampling period. Signed copies of

Discharge Monitoring Reports, or said certifications, shall be submitted to the Director of the NPDES program at the address of the appropriate Regional Office listed in Part VI.G. of the fact sheet.

(1) Additional Notification. In addition to filing copies of discharge monitoring reports in accordance with paragraph b (above), TSDFs with at least one storm water discharge associated with industrial activity through a large or medium municipal separate storm sewer system (systems serving a population of 100,000 or more) must submit signed copies of discharge monitoring reports to the operator of the municipal separate storm sewer system in accordance with the dates provided in paragraph b (above).

c. Monthly Visual Examination of Storm Water Quality. Facilities shall perform and document a visual examination of a representative storm water discharge associated with industrial activity exposed to storm water. The examination must be made at least once in each month during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(1) Examinations shall be made of samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 1 hour) of when the runoff or snowmelt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The inspection must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Where practicable, the same individual should carry out the collection and examination of discharges for entire permit term.

(2) Visual observation reports must be maintained onsite in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

(3) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the observation data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

(4) When a discharger is unable to collect samples over the course of the monitoring period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

L. Storm Water Discharges Associated With Industrial Activity From Landfills and Land Application Sites

1. Discharges Covered Under This Section. The requirements listed under this section shall apply to storm water discharges associated with industrial activity from waste disposal at landfills and land application sites that receive or have received industrial wastes. Landfill and land application operators which have storm water discharges from other types of industrial activities such as vehicle maintenance, truck washing, composting, and/or recycling may be subject to additional requirements specified elsewhere in this permit.

2. Special Conditions

a. Prohibition of Non-storm Water Discharges. The discharge of leachate and vehicle and equipment washwaters to waters of the United States or a municipal separate storm sewer system is not authorized by this permit. The operators of such discharges must obtain coverage under a separate NDPES

permit (other than this permit). Discharges from open dumps as defined under RCRA are also not authorized under this permit (e.g., leachate, runoff).

When an industrial facility, described by the above eligibility provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

If monitoring and pollution prevention plan requirements of another industrial activity section of this permit apply to co-located industrial activities at an industrial facility, the eligibility provisions of that industrial activity section shall not preclude the operator of the industrial facility from complying with the applicable monitoring and pollution prevention plan requirements of that section.

3. Storm Water Pollution Prevention Plan Requirements

a. Contents of Plan. The plan shall include, at a minimum, the following items:

(1) Pollution Prevention Team. Each plan shall identify a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team that are responsible for developing the storm water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

(2) Description of Potential Pollutant Sources. Each plan shall provide a description of potential sources which may reasonably be expected to add significant amounts of pollutant to storm water discharges or which may result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. Each plan shall identify all activities and significant materials which may potentially be significant pollutant

sources. Each plan shall include, at a minimum:

(a) Drainage

(i) A site map indicating an outline of the portions of the drainage area of each storm water outfall that are within the facility boundaries, each existing structural control measure to reduce pollutants in storm water runoff, surface water bodies, locations of active and closed landfill cells or trenches, locations of active and closed land application areas, locations of any known leachate springs or other areas where uncontrolled leachate may commingle with runoff, locations of any leachate collection and handling systems, locations where major spills or leaks identified under Part XI.L.3.a.(2)(c) (Spills and Leaks) of this permit have occurred, and locations of the following activities where such activities are exposed to precipitation: fueling station, vehicle and equipment maintenance and/or cleaning areas, and waste and other significant material loading/unloading and storage areas.

(ii) For each area of the facility that generates storm water discharges associated with industrial activity with a reasonable potential for containing significant amounts of pollutants, a prediction of the direction of flow, and an identification of the types of pollutants which are likely to be present in storm water discharges associated with industrial activity. Factors to consider include the toxicity of chemicals; quantities of chemicals used, produced or discharged; the likelihood of contact with storm water; and the history of significant leaks or spills of toxic or hazardous pollutants. Flows with a significant potential for causing erosion shall be identified.

(b) Inventory of Exposed Materials— An inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such inventory shall include a narrative description of significant materials that have been handled, treated, or disposed of in a manner to allow exposure to storm water between the time of the exposure to storm water between the time of 3 years prior to the date of the issuance of this permit and the present; method and location of onsite storage or disposal; materials management practices employed to minimize contact of materials with storm water runoff between the time of 3 years prior to the date of issuance of this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of any treatment the storm water receives. The inventory of exposed materials

shall include, but shall not be limited to the significant material management practices employed.

(c) *Spills and Leaks*—A list of significant spills and significant leaks of toxic or hazardous pollutants that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility after the date of 3 years prior to the effective date of this permit. Such list shall be updated as appropriate during the term of the permit.

(d) *Sampling Data*—A summary of existing discharge sampling data describing pollutants in storm water of sampling data collected during the term of this permit. Permittees shall also provide all available sampling data for leachate generated at the site.

(e) *Risk Identification and Summary of Potential Pollutant Sources*—Include a narrative description of potential pollutant sources associated with any of the following, providing they occur at the facility: fertilizer, herbicide and pesticide application; earth/soil moving; waste hauling and loading/unloading; outdoor storage of significant materials including daily, interim and final cover material stockpiles as well as temporary waste storage areas; exposure of active and inactive landfill and land application areas; uncontrolled leachate flows; failure or leaks from leachate collection and treatment systems haul roads; and vehicle tracking of sediments. The description shall specifically list any significant potential sources of pollutants at the site and for each potential source, any pollutant or pollutant parameter (e.g., biochemical oxygen demand, etc.) of concern shall be identified.

(3) *Measures and Controls*. Each facility covered by this permit shall develop a description of storm water management controls appropriate for the facility, and implement such controls. The appropriateness and priorities of controls in a plan shall reflect identified potential sources of pollutants at the facility. The description of storm water management controls shall address the following minimum components, including a schedule for implementing such controls:

(a) *Good Housekeeping*—Good housekeeping requires the maintenance of areas which may contribute pollutants to storm water discharges in a clean, orderly manner. Permittees shall consider providing protected materials storage areas for pesticides, herbicides, fertilizers, and other significant materials.

(b) *Preventive Maintenance*—A preventive maintenance program shall

involve timely inspection and maintenance of storm water management devices (e.g., cleaning oil/water separators, catch basins) as well as inspecting and testing facility equipment and systems to uncover conditions that could cause breakdowns or failures resulting in discharges of pollutants to surface waters, and ensuring appropriate maintenance of such equipment and systems.

Where applicable, permittees addressed by this section shall also: (1) maintain containers used for outdoor chemical and significant materials storage to prevent leaking or rupture; (2) maintain all elements of leachate collection and treatment systems to prevent commingling of leachate with storm water; and (3) maintain the integrity and effectiveness of any intermediate or final cover, including making repairs to the cover as necessary to minimize the effects of settlement, sinking, and erosion.

(c) *Spill Prevention and Response Procedures*—Areas where potential spills which can contribute pollutants to storm water discharges can occur, and their accompanying drainage points shall be identified clearly in the storm water pollution prevention plan. Where appropriate, specifying material handling procedures, storage requirements, and use of equipment such as diversion valves in the plan should be considered. Procedures for cleaning up spills shall be identified in the plan and made available to the appropriate personnel. The necessary equipment to implement a clean up should be available to personnel.

(d) *Inspections*—Qualified facility personnel shall be identified to inspect designated equipment and areas of the facility at appropriate intervals specified in the plan.

(i) For operating landfills and land application sites, inspections shall be conducted at least once every 7 days and within 24 hours of a storm event. Qualified personnel shall inspect areas of landfills that have not yet been finally stabilized, active land application areas, areas used for storage of materials/wastes that are exposed to precipitation, stabilization and structural control measures, leachate collection and treatment systems, and locations where equipment and waste trucks enter and exit the site. Where landfill areas have been finally stabilized and where land application has been completed, or during seasonal arid periods in arid areas (areas with an average annual rainfall of 0 to 10 inches) and semiarid areas (areas with an average annual rainfall of 10 to 20 inches), inspections will be conducted at least once every

month. Erosion and sediment control measures shall be observed to ensure they are operating correctly.

(ii) For inactive landfills and land application sites, inspections shall be conducted at least semiannually and at least 5 months apart, and qualified personnel shall inspect: landfill stabilization and structural erosion control measures and leachate collection and treatment systems, and all closed land application areas.

A set of tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections. The pollution prevention plan shall be revised to address any problems found during inspections. Records of inspections shall be maintained.

(e) *Employee Training*—Employee training programs shall inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise responsible for storm water management at all levels of responsibility of the components and goals of the storm water pollution prevention plan. Training should address topics such as conducting inspections, spill response, good housekeeping, conducting inspections and material management practices. The pollution prevention plan shall identify periodic dates for such training.

(f) *Recordkeeping and Internal Reporting Procedures*—A description of incidents (such as spills, or other discharges), along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. Inspections and maintenance activities shall be documented and records of such activities shall be incorporated into the plan. Landfill operators shall provide for a tracking system for the types of wastes disposed of in each cell or trench of a landfill. Land application site operators shall track the types and quantities of wastes applied in specific areas.

(g) *Non-storm Water Discharges*

(i) The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges including leachate and vehicle wash waters. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed

during the test. Certifications shall be signed in accordance with Part VII.G. of this permit. Such certification may not be feasible if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit which receives the discharge. In such cases, the source identification section of the storm water pollution plan shall indicate why the certification required by this part was not feasible, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with paragraph XI.L.3.a.(3)(g)(iii) (below).

(ii) Except for flows from fire fighting activities, sources of non-storm water listed in Part III.A. (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

(iii) *Failure to Certify*—Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director by [Insert date 180 days after permit issuance] or, for facilities which begin to discharge storm water associated with industrial activity after [Insert date of permit issuance], 180 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: the procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States which are not authorized by an NPDES permit are unlawful, and must be terminated.

(h) *Sediment and Erosion Control*—The plan shall identify areas which, due to topography activities, or other factors, have a high potential for significant soil erosion, and identify structural, vegetative, and/or stabilization measures to be used to limit erosion.

Landfill operators shall provide for temporary stabilization of materials stockpiled for daily, intermediate and final cover. Stabilization practices to consider include but are not limited to temporary seeding, mulching, and

placing geotextiles on the inactive portions of the stockpiles.

Landfill operators shall provide for temporary stabilization of inactive areas of the landfill which have an intermediate cover but no final cover.

Landfill operators shall provide for temporary stabilization of any landfill areas which have received a final cover until vegetation has established itself. Land application site operators shall also stabilize areas where waste application has been completed until vegetation has been established.

Landfill operators shall provide for temporary stabilization of any landfill areas which have received a final cover until vegetation has established itself. Land application site operators shall also stabilize areas where waste application has been completed until vegetation has been established.

(i) *Management of Runoff*—The plan shall also contain a narrative consideration of the appropriateness of traditional storm water management practices (practices other than those which control the generation or source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. The plan shall provide that measures that the permittee determines to be reasonable and appropriate shall be implemented and maintained. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity [see paragraph XI.L.3.a.(2) of this section (Description of Potential Pollutant Sources)] shall be considered when determining reasonable and appropriate measures. Appropriate measures may include: silt fences, earth dikes, gradient terraces, drainage swales, sediment traps, check dams, pipe slope drains, level spreaders, storm drain inlet protection, rock outlet protection, reinforced soil retaining systems, gabions and temporary or permanent sediment basins. Structural practices should be placed on upland soils as practicable.

(4) *Comprehensive Site Compliance Evaluation*. Qualified personnel shall conduct site compliance evaluations at appropriate intervals specified in the plan, but in no case less than once a year. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with industrial activity at landfill and land application sites shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to

determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, and other structural pollution prevention measures identified in the plan shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the inspection, the description of potential pollutant sources identified in the plan in accordance with paragraph XI.L.3.a.(2) of this section (Description of Potential Pollutant Sources) and pollution prevention measures and controls identified in the plan in accordance with paragraph XI.L.3.a.(3) of this section (Measures and Controls) shall be revised as appropriate within 2 weeks of such inspection and shall provide for implementation of any changes to the plan in timely manner, but in no case more than 12 weeks after the inspection.

(c) A report summarizing the scope of the inspection, personnel making the inspection, the date(s) of the inspection, major observations relating to the implementation of the storm water pollution prevention plan for at least 1 year after coverage under this permit terminates. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) Where compliance evaluation schedules overlap with inspections required under 3.a.(3)(d), the compliance evaluation may be conducted in place of one such inspection.

4. Numeric Effluent Limitations

There are no additional numeric effluent limitations beyond those in Part V. of this permit.

5. Monitoring and Reporting Requirements

a. *Analytical Monitoring Requirements*. During the period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] and the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit

issuance), permittees with landfill/land application sites (except those that are closed in accordance with 40 CFR 258.60) must monitor their storm water discharges associated with industrial activity at least quarterly (4 times per year) except as provided in paragraphs 5.a.(3) (Sampling Waiver), 5.a.(4) (Representative Discharge), and 5.a.(5)

(Alternative Certification). Landfill/land application sites are required to monitor their storm water discharges for the pollutants of concern listed in Table L-1 below. Facilities must report in accordance with 5.b. (Reporting). In addition to the parameters listed in Table L-1 below, the permittee shall provide the date and duration (in hours)

of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event that generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

TABLE L-1.—INDUSTRY MONITORING REQUIREMENTS

| Pollutants of concern | Cut-off concentration (mg/L) |
|---|------------------------------|
| Total Suspended Solids (TSS) ⁱ | 100 |
| Total Phosphorus ⁱⁱ | 0.33 |
| Total Recoverable Iron ⁱⁱ | 0.3 |
| Total Recoverable Lead ⁱⁱ | 0.0337 |

ⁱ Applicable to all landfill and land application sites.

ⁱⁱ Applicable to all facilities except MSWLF areas closed in accordance with 40 CFR 258.60 requirements.

(1) *Monitoring Periods.* Landfill/land application sites shall monitor samples collected during the sampling periods of: January to March, April to June, July to September, and October to December for the years specified in paragraph a (above).

(2) *Sample Type.* A minimum of one grab sample shall be taken. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inch in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable. If storm water discharges associated with industrial activity commingle with process or nonprocess water, then where practicable, permittees must attempt to sample the storm water discharge before it mixes with the non-storm water discharge.

(3) Sampling Waiver

(a) *Adverse Conditions.*—When a discharger is unable to collect samples during one of the monitoring periods specified in paragraph 5.a.(1) (Monitoring Periods) because of adverse climatic conditions, the discharger may collect two samples from the two separate qualifying events in the next monitoring period and submit this data. Adverse weather conditions that may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel

(such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (e.g., drought, extended frozen conditions, etc.).

(b) *Low Concentration Waiver.*—When the average concentration for a pollutant calculated from all monitoring data collected from an outfall during the monitoring period [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] is less than the corresponding value for that pollutant listed in Table L-1 under the column Monitoring Cut-off Concentration, a facility may waive monitoring and reporting requirements in the monitoring period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance]. The facility must submit to the Director, in lieu of the monitoring data, a certification that there has not been a significant change in industrial activity or the pollution prevention measures in area of the facility which drains to the outfall for which sampling was waived.

(4) *Representative Discharge.* When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may test the effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical

effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan. The permittee shall include the description of the location of the outfalls, explanation of why outfalls are expected to discharge substantially identical effluents, and estimate of the size of the drainage area and runoff coefficient with the Discharge Monitoring Report.

(5) *Alternative Certification.* A discharger is not subject to the monitoring requirements of this section provided the discharger makes a certification for a given outfall, on an annual basis, under penalty of law, signed in accordance with Part VII.G. (Signatory Requirements), that material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, industrial machinery or operations, or significant materials from past industrial activity, that are located in areas of the facility within the drainage area of the outfall are not presently exposed to storm water and are not expected to be exposed to storm water for the certification period. Such certification must be retained in the storm water pollution prevention plan, and submitted to EPA in accordance with Part VI.C. of the fact sheet to this permit.

b. *Reporting.* Permittees with landfill/land application sites shall submit monitoring results for each outfall associated with industrial activity [or a certification in accordance with Sections (3), (4), or (5) above] obtained

during the reporting period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March [insert the date 2 years after permit issuance]. Monitoring results [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance] shall be submitted on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March. A separate Discharge Monitoring Report Form is required for each quarterly sampling period. Signed copies of Discharge Monitoring Reports, or said certifications, shall be submitted to the Director of the NPDES program at the address of the appropriate Regional Office listed in Part VI.G. of the fact sheet to this permit.

(1) *Additional Notification.* In addition to filing copies of discharge monitoring reports in accordance with paragraph b (above) landfill/land application sites, with at least one storm water discharge associated with industrial activity through a large or medium municipal separate storm sewer system (systems serving a population of 100,000 or more) must submit signed copies of discharge monitoring reports to the operator of the municipal separate storm sewer system in accordance with the dates provided in paragraph b (above).

c. *Monthly Visual Examination of Storm Water Quality.* Facilities shall perform and document a visual examination of a representative storm water discharge associated with industrial activity exposed to storm water. The examination must be made at least once in each month during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(1) Examinations shall be made of samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 1 hour) of when the runoff or snowmelt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The inspection must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in

magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Where practicable, the same individual should carry out the collection and examination of discharges for the entire permit term.

(2) Visual observation reports must be maintained onsite in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

(3) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the observation data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

(4) When a discharger is unable to collect samples over the course of the monitoring period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

6. Definition

"Inactive Landfill"—For the purposes of this permit, a landfill is considered inactive when, on a permanent basis, it will no longer receive waste and has completed closing in accordance with

any applicable Federal, State, and/or local requirements.

M. Storm Water Discharges Associated With Industrial Activity From Automobile Salvage Yards

1. Discharges Covered Under This Section

The requirements of this section apply to point source discharges of storm water associated with industrial activity from facilities engaged in dismantling or wrecking used motor vehicles for parts recycling or resale and for scrap, including those facilities classified as Standard Industrial Classification (SIC) Code 5015.

When an industrial facility, described by the above eligibility provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

If monitoring and pollution prevention plan requirements of another industrial activity section of this permit apply to co-located industrial activities at an industrial facility, the eligibility provisions of that industrial activity section shall not preclude the operator of the industrial facility from complying with the applicable monitoring and pollution prevention plan requirements of that section.

2. Storm Water Pollution Prevention Plan Requirements

a. *Contents of Plan.* The plan shall include, at a minimum, the following items:

(1) *Pollution Prevention Team.* Each plan shall identify a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team that are responsible for developing the storm water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall

address all aspects of the facility's storm water pollution prevention plan.

(2) *Description of Potential Pollutant Sources.* Each storm water pollution prevention plan must describe industrial activities, significant materials, and physical features of the facility that may contribute to storm water runoff or, during periods of dry weather, result in dry weather flows. Plans must include the following elements:

(a) *Site Map*—The plan must contain a map of the site that shows structural features that control pollutants in storm water runoff⁵ and process wastewater discharges, surface water bodies (including wetlands), places where significant materials are exposed to rainfall and runoff, and locations of major spills and leaks that occurred in the 3 years prior to the effective date of this permit. The map must also indicate the flow direction of storm water runoff. The location of each storm water outfall associated with an industrial activity, as well as an outline of the drainage area for each storm water outfall must be indicated. The map must indicate the location of each monitoring point. The map must include an estimation (in acres) of the total area used for industrial activity including, but not limited to, dismantling, storage, and maintenance of used motor vehicles and motor vehicle parts. The map must also indicate the location of the following activities where such activities are exposed to precipitation: vehicle storage areas; dismantling areas; parts storage areas, including engine blocks, tires, hub caps, batteries, hoods, and mufflers; fueling stations; vehicle and equipment maintenance areas; cleaning areas (parts, vehicles, and/or equipment); loading and unloading areas; locations used for the treatment, storage, and disposal of wastes; and liquid storage tanks and drums for fuel and other fluids.

(b) *Inventory of Potential Pollutant Sources*—Facility operators are required to carefully conduct an inspection of the site to identify significant materials exposed to precipitation that may contribute pollutants to storm water discharges. The inventory must address materials that within 3 years prior to the effective date of the permit have been handled, stored, processed, treated, or disposed of in a manner to allow exposure to storm water. Findings of the inventory must be documented in detail in the pollution prevention plan. At a minimum, the plan must describe the method and location of onsite storage or

disposal; practices used to minimize contact of materials with rainfall and runoff; existing structural and nonstructural controls that reduce pollutants in storm water runoff; existing structural controls that prohibit/control process wastewater discharges; and any treatment the runoff receives before it is discharged to surface waters or through a separate storm sewer system. The description must be updated whenever there is a significant change in the types or amounts of materials, or material management practices, that may affect the exposure of materials to storm water.

(c) *Significant Spills and Leaks*—The plan must include a list of any significant spills and leaks of toxic or hazardous pollutants that occurred in the 3 years prior to the effective date of the permit. Significant spills include, but are not limited to, releases of oil or hazardous substances in excess of quantities that are reportable under Section 311 of CWA (see 40 CFR 110.10 and 40 CFR 117.21) or Section 102 of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) (see 40 CFR 302.4). Significant spills may also include releases of oil or hazardous substances that are not in excess of reporting requirements and releases of materials that are not classified as oil or a hazardous substance. Such list shall be updated as appropriate during the term of the permit.

(d) *Sampling Data*—Any existing data or data collected during the term of this permit describing the quality or quantity of storm water discharges from the facility must be summarized in the plan. The description should include a discussion of the methods used to collect and analyze the data. Sample collection points should be identified in the plan and shown on the site map.

(e) *Summary of Potential Pollutant Sources*—The description of potential pollution sources should clearly point to activities, materials, and physical features of the facility that have a reasonable potential to contribute significant amounts of pollutants to storm water discharges. Any such industrial activities, significant materials, or features must be addressed by the measures and controls subsequently described in the plan. In conducting the assessment, the facility operator must consider the potential for the following activities to contribute pollutants: vehicle storage areas; dismantling areas; parts storage areas, including engine blocks, tires, hub caps, batteries, and hoods; fueling stations; vehicle and equipment maintenance

areas; cleaning areas (parts and vehicles and/or equipment); loading/unloading areas; locations used for the treatment, storage, and disposal of wastes; and liquid storage tanks and drums for fuel and other fluids.

The assessment must identify the pollutant parameter or parameters (i.e., copper, iron, lead, oil and grease, total suspended solids, etc.) associated with each pollutant source.

(3) *Measures and Controls.* Following completion of the source identification and assessment phase, the permittee must evaluate, select, and describe the pollution prevention measures, best management practices (BMPs), and other controls that will be implemented at the facility. BMPs include processes, procedures, schedules of activities, prohibitions on practices, and other management practices that prevent or reduce the discharge of pollutants in storm water runoff.

The pollution prevention plan must discuss the reasons each selected control or practice is appropriate for the facility and how each will address the potential sources of storm water pollution. The plan also must include a schedule specifying the time or times during which each control or practice will be implemented. In addition, the plan should discuss ways in which the controls and practices relate to one another and, when taken as a whole, produce an integrated and consistent approach for preventing or controlling potential storm water contamination problems.

(a) *Good Housekeeping*—Good housekeeping requires the maintenance of areas which may contribute pollutants to storm waters discharges in a clean, orderly manner.

(b) *Preventive Maintenance*—The preventive maintenance program shall schedule periodic inspections and ensure appropriate maintenance of storm water management devices and facility equipment and systems. This program will address conditions that could cause breakdowns or failures resulting in the discharge of pollutants to surface waters. The maintenance program shall include periodic removal of debris from discharge diversions, conveyance systems, and impoundments/ponds. These activities should be conducted in the spring, after snow melt, and during the fall season. Maintenance schedules for sedimentation/impoundments must be provided in the pollution prevention plan.

(c) *Spill and Leak Prevention and Response Procedures*—Areas where potential spills which can contribute pollutants to storm water discharges can

⁵ Features such as grass swales and vegetative buffer strips also should be shown.

occur, and their accompanying drainage points shall be identified clearly in the storm water pollution prevention plan. Where appropriate, specifying material handling procedures, storage requirements, and use of equipment such as diversion valves in the plan should be considered. Procedures for cleaning up spills shall be identified in the plan and made available to the appropriate personnel. The necessary equipment to implement a clean up should be available to personnel. After clean up from a spill, absorbents must be promptly placed in containers for proper disposal. All vehicles that are intended to be dismantled must be properly drained of all fluids upon arrival at the site, or as soon as feasible thereafter, or other equivalent means must be taken to prevent leaks or spills of such fluids.

(d) *Inspections*—Upon arrival at the site, or as soon as feasible thereafter, vehicles must be inspected for leaks. Any equipment containing oily parts, hydraulic fluids, or any other types of fluids shall be inspected at least quarterly (four times per year) for signs of leaks. Any outdoor storage of fluids including, but not limited to, brake fluid, transmission fluid, radiator water, and antifreeze, must be inspected at least quarterly for leaks. All outdoor liquid storage containers (e.g., tanks, drums) must be inspected at least quarterly for leaks.

Qualified facility personnel are required to conduct quarterly visual inspections of BMPs. The inspections shall include: 1) an assessment of the integrity of storm water flow diversion and source minimization systems; 2) visual inspections of dismantling areas, vehicle and equipment maintenance areas, vehicle, equipment, and parts cleaning and storage areas, and other potential sources of pollution for evidence of actual or potential pollutant discharges of contaminated storm water.

Examinations shall be conducted in each of the following periods: December to February; March to May; June to August; and September to November.

Reports of the quarterly inspections (or more frequent if appropriate) shall be retained as part of the plan. Based on the results of each inspection the plan must be revised as appropriate within 2 weeks after each inspection. Changes in the measures and controls must be implemented on the site in a timely manner, and never more than 12 weeks after completion of the inspection.

(e) *Employee Training*—Employee training programs shall inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise

responsible for storm water management at all levels of responsibility of the components and goals of the storm water pollution prevention plan. The pollution prevention plan shall identify how often training will take place, but in all cases, training must be held at least twice a year. Employee training must, at a minimum, address the following areas when applicable to a facility: proper handling (collection, storage, and disposal) of oil, used mineral spirits, anti-freeze, and solvents; spill prevention and response; fueling procedures; good housekeeping practices; and used battery management.

(f) *Recordkeeping and Internal Reporting Procedures*—A description of incidents such as spills, or other discharges, along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. The permittee must describe procedures for developing and retaining records on the status and effectiveness of plan implementation. The plan must address monitoring, and BMP inspection and maintenance activities. Ineffective BMPs must be reported and the date of their corrective action noted. Employees must report incidents of leaking fluids to facility management and document such leaks in the plan. The facility must also:

- Maintain records (gallons per month) of drained waste oil, anti-freeze, mineral spirits, and gasoline
- Identify by name and EPA or State identification number (if any) all transporters, recyclers, and disposal facilities of used waste oil, antifreeze, mineral spirits, batteries, scrap metal, and tires
- Maintain records (gallons per month) of waste oil, anti-freeze, gasoline, freon, batteries, scrap materials, and tires that are sent to recyclers
- Maintain records of the number of batteries removed from cars and sold or recycled per month.

(g) *Non-storm Water Discharges*

(i) The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of

this permit. Such certification may not be feasible if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit which receives the discharge. In such cases, the source identification section of the storm water pollution plan shall indicate why the certification required by this part was not feasible, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with Part XI.M.2.b.(3)(g)(iii) (Failure to Certify) of this permit.

(ii) Except for flows from fire fighting activities, sources of non-storm water listed in Part III.A. (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

(iii) *Failure to Certify*—Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director by [Insert date 270 days after permit issuance] or, for facilities which begin to discharge storm water associated with industrial activity after [Insert date 270 days after permit issuance], 180 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: the procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States which are not authorized by an NPDES permit are unlawful, and must be terminated.

(h) *Sediment and Erosion Control*—The plan shall identify areas which, due to topography, activities, or other factors, have a high potential for significant soil erosion, and identify structural, vegetative, and/or stabilization measures to be used to limit erosion. Permittees must consider measures to maximize stabilization of industrial areas using vegetative cover, gravel, impervious surfaces or other appropriate measures.

(i) *Management of Runoff*—The plan shall contain a narrative consideration of the appropriateness of traditional

storm water management practices (practices other than those which control the generation or source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. The plan shall provide measures that the permittee determines to be reasonable and appropriate and shall be implemented and maintained. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity (see Part XI.M.2.a.(2) (Description of Potential Pollutant Sources) of this permit) shall be considered when determining reasonable and appropriate measures. Appropriate measures may include: vegetative swales and practices, reuse of collected storm water (such as for a process or as an irrigation source), inlet controls (such as oil/water separators), snow management activities, infiltration devices, and wet detention/retention devices. In addition, the permittee must describe the storm water pollutant source area or activity (e.g., dismantling area, storage area, cleaning operations) to be controlled by each storm water management practice.

The plan must consider management practices, such as berms or drainage ditches on the property line, that may be used to prevent runoff from neighboring properties. Berms must be considered for uncovered outdoor storage of oily parts, engine blocks, and above ground liquid storage. The installation of detention ponds must also be considered. The permittee shall consider the installation of a filtering device to receive runoff from industrial areas. The installation of oil/water separators must also be considered.

(4) *Comprehensive Site Compliance Evaluation.* Qualified personnel shall conduct site compliance evaluations at appropriate intervals specified in the plan in no case less than twice a year. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with industrial activity shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, and other structural pollution prevention measures identified in the plan shall be observed to ensure that they are

operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the inspection, the description of potential pollutant sources identified in the plan in accordance with Part XI.M.2.a.(2) (Description of Potential Pollutant Sources) of this permit and pollution prevention measures and controls identified in the plan in accordance with paragraph XI.M.2.a.(3) (Measures and Controls) of this permit shall be revised as appropriate within 2 weeks of such inspection and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the inspection.

(c) A report summarizing the scope of the inspection, personnel making the inspection, the date(s) of the inspection, major observations relating to the implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph XI.M.2.a.(4)(b) (above) of the permit shall be made and retained as part of the storm water pollution prevention plan for at least 3 years after coverage under this permit terminates. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) The storm water pollution prevention plan must describe the scope and content of comprehensive site inspections that qualified personnel will conduct to 1) confirm the accuracy of the description of potential pollution sources contained in the plan, 2) determine the effectiveness of the plan, and 3) assess compliance with the terms and conditions of the permit. Comprehensive site compliance evaluations should be conducted twice a year. The individual or individuals who will conduct the inspections must be identified in the plan and should be members of the pollution prevention team. Inspection reports must be retained for at least 3 years after the date that the permit expires.

(e) Where compliance evaluation schedules overlap with inspections required under 3.a.(3)(d), the compliance evaluation may be conducted in place of one such inspection.

Based on the results of each inspection, the description of potential pollution sources, and measures and

controls, the plan must be revised as appropriate within 2 weeks after each inspection. Changes in the measures and controls must be implemented on the site in a timely manner, and never more than 12 weeks after completion of the inspection.

3. *Numeric Effluent Limitations.* There are no additional numeric effluent limitations beyond those described in Part V. of this permit.

4. *Monitoring and Reporting Requirements*

a. *Analytical Monitoring Requirements.* During the period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] and the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance], permittees operating automobile salvage yards must monitor their storm water discharges associated with industrial activity at least quarterly (4 times per year) except as provided in paragraphs 4.a.(3) (Sampling Waiver), 4.a.(4) (Representative Discharge), and 4.a.(5) (Alternative Certification). Automobile salvage yards are required to monitor their storm water discharges for the pollutants of concern listed in Table M-1 below. Facilities must report in accordance with 5.b. (Reporting). In addition to the parameters listed in Table M-1 below, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event that generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

TABLE M-1.—MONITORING REQUIREMENTS

| Pollutants of concern | Monitoring cut-off concentration |
|----------------------------------|----------------------------------|
| Chemical oxygen demand | 65 mg/L |
| pH | 6 to 9 s.u. |
| Total Suspended Solids | 100 mg/L |
| Total Kjeldahl Nitrogen | 1.5 mg/L |
| Nitrate plus Nitrite as Nitrogen | 0.68 mg/L |

(1) *Monitoring Periods.* Automobile salvage yards shall monitor samples collected during the sampling periods of: January to March, April to June, July to September, and October to December for the years specified in paragraph a. (above).

(2) *Sample Type.* A minimum of one grab sample shall be taken. All such

samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable. If storm water discharges associated with industrial activity commingle with process or nonprocess water, then where practicable permittees must attempt to sample the storm water discharge before it mixes with the non-storm water discharge.

EPA requests comments upon a condition of today's proposed permit that would require permittees who are unable to sample storm water discharges before they commingle with non-storm water discharges to sample the combined discharge both during dry and wet weather and submit both sets of data to the permitting authority.

(3) Sampling Waiver

(a) *Adverse Conditions*—When a discharger is unable to collect samples during one of the monitoring periods specified in paragraph b. (Monitoring Periods) because of adverse climatic conditions, the discharger may collect two samples from the two separate qualifying events in the next monitoring period and submit this data. Adverse weather conditions that may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (e.g., drought, extended frozen conditions, etc.).

(b) *Low Concentration Waiver*—When the average concentration for a pollutant calculated from all monitoring data collected from an outfall during the monitoring period [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] is less than the corresponding value for that pollutant listed in Table M-1 under the column Monitoring Cut-off Concentration, a facility may waive monitoring and reporting requirements in the monitoring period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance]. The facility must submit to the Director, in lieu of the monitoring data, a certification that

there has not been a significant change in industrial activity or the pollution prevention measures in the area of the facility which drains to the outfall for which sampling was waived.

(4) *Representative Discharge*. When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may test the effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan. The permittee shall include the description of the location of the outfalls, explanation of why outfalls are expected to discharge substantially identical effluents, and estimate of the size of the drainage area and runoff coefficient with the Discharge Monitoring Report.

(5) *Alternative Certification*. A discharger is not subject to the monitoring requirements of this section provided the discharger makes a certification for a given outfall, on an annual basis, under penalty of law, signed in accordance with Part VII.G. (Signatory Requirements), that material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, industrial machinery or operations, or significant materials from past industrial activity, that are located in areas of the facility within the drainage area of the outfall are not presently exposed to storm water and are not expected to be exposed to storm water for the certification period. Such certification must be retained in the storm water pollution prevention plan, and submitted to EPA in accordance with Part VI.C. of this permit.

b. *Reporting*. Permittees with automobile salvage yards shall submit monitoring results for each outfall associated with industrial activity [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the reporting period beginning

[insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March [insert the date 2 years after permit issuance]. Monitoring results [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance] shall be submitted on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March. A separate Discharge Monitoring Report Form is required for each quarterly sampling period. Signed copies of Discharge Monitoring Reports, or said certifications, shall be submitted to the Director of the NPDES program at the address of the appropriate Regional Office listed in Part VI.C. of the fact sheet.

(1) *Additional Notification*. In addition to filing copies of discharge monitoring reports in accordance with paragraph b (above), automobile salvage yards with at least one storm water discharge associated with industrial activity through a large or medium municipal separate storm sewer system (systems serving a population of 100,000 or more) must submit signed copies of discharge monitoring reports to the operator of the municipal separate storm sewer system in accordance with the dates provided in paragraph b (above).

c. *Monthly Visual Examination of Storm Water Quality*. Facilities shall perform and document a visual examination of a representative storm water discharge associated with industrial activity exposed to storm water. The examination must be made at least once in each month during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(1) Examinations shall be made of samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 1 hour) of when the runoff or snowmelt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The inspection must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72

hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Where practicable, the same individual should carry out the collection and examination of discharges for the entire permit term.

(2) Visual observation reports must be maintained onsite in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

(3) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the observation data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

(4) When a discharger is unable to collect samples over the course of the monitoring period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (e.g., drought, extended frozen conditions, etc.).

5. Retention of Records

The permittee shall retain records of all inspections and monitoring information, including certification reports, noncompliance reports, calibration and maintenance records and all original strip chart recordings for

continuous monitoring instrumentation, copies of all reports, and supporting data, requested by the permitting authority for at least 3 years after the date that the permit expires.

N. Storm Water Discharges Associated With Industrial Activity From Scrap and Waste Material Processing and Recycling Facilities

1. *Discharges Covered Under This Section.* The requirements listed under this section shall apply to storm water discharges from the following activities: facilities that are engaged in the processing, reclaiming and wholesale distribution of scrap and waste materials such as ferrous and nonferrous metals, paper, plastic, cardboard, and glass. These types of activities are typically identified by Standard Industrial Classification (SIC) 5093. Facilities that are engaged in reclaiming and recycling liquid wastes such as used oil, antifreeze, mineral spirits and industrial solvents and which are classified under SIC 5093 are also covered under this section.

When an industrial facility, described by the above eligibility provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

If monitoring and pollution prevention plan requirements of another industrial activity section of this permit apply to co-located industrial activities at an industrial facility, the eligibility provisions of that industrial activity section shall not preclude the operator of the industrial facility from complying with the applicable monitoring and pollution prevention plan requirements of that section.

2. Special Conditions

a. Prohibition of Non-storm Water Discharges

(1) Except as provided in paragraph XI.N.2.b., all discharges covered by this permit shall be composed entirely of storm water.

(a) Except as provided in paragraph XI.N.2.b. (below), discharges of material other than storm water to waters of the United States, or through municipal separate storm sewer systems, are not authorized by this permit. The operators of such discharges must obtain coverage under a separate National Pollutant Discharge Elimination System (NPDES) permit (other than this permit) issued for the discharge.

(b) The following non-storm water discharges are authorized by this permit provided the non-storm water component of the discharge is in compliance with paragraph XI.N.3.a.(3) (Measures and Controls for Storm Water Discharges): discharges from fire fighting activities; fire hydrant flushing; potable water sources including waterline flushings; irrigation drainage; lawn watering; routine external building washdown which does not use detergents or other compounds; pavement washwaters where spills or leaks of toxic or hazardous materials have not occurred (unless all spilled materials have been removed) and where detergents are not used; air conditioning condensate; springs; and uncontaminated ground water.

3. Storm Water Pollution Prevention Plan Requirements

a. Contents of Plan. The following general requirements for the storm water pollution prevention plan are applicable to activities which reclaim and recycle either recyclable nonliquid and liquid waste materials. In addition to the general requirements, Paragraph XI.N.3.a.(3)(a) (below) identifies special requirements for scrap and waste recycling facilities that handle nonliquid wastes and paragraph XI.N.3.a.(3)(b) (below) identifies special requirements for waste recycling facilities that handle only liquid wastes. The plan shall include, at a minimum, the following items:

(1) *Pollution Prevention Team.* Each plan shall identify a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team that are responsible for developing the storm water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

(2) *Description of Potential Pollutant Sources.* Each plan shall provide a description of potential sources which may reasonably be expected to add

significant amounts of pollutants to storm water discharges or which may result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. Each plan shall identify all activities and significant materials which may potentially be significant pollutant sources or, during periods of dry weather, result in dry weather flows. Each plan shall include, at a minimum:

(a) *Drainage*

(i) A site map indicating an outline of the portions of the drainage area of each storm water outfall that are within the facility boundaries, each existing structural control measure to reduce pollutants in storm water runoff, surface water bodies (including wetlands), locations where significant materials are exposed to precipitation including scrap and waste material storage and outdoor scrap and waste processing equipment, locations where major spills or leaks identified in paragraph XI.N.3.a.(2)(c) of this section have occurred, and the locations of the following activities where such activities are exposed to precipitation: fueling stations, vehicle and equipment maintenance and/or cleaning areas, loading/unloading areas, locations used for the treatment, storage or disposal of wastes, material storage (including tanks or other vessels used for liquid or waste storage). The site map must also identify monitoring locations.

(ii) For each area of the facility that generates storm water discharges associated with industrial activity with a reasonable potential for containing significant amounts of pollutants, a prediction of the direction of flow, and an identification of the types of pollutants which are likely to be present in storm water discharges associated with industrial activity. Factors to consider include the toxicity of a chemical; quantity of chemicals used, produced or discharged; the likelihood of contact with storm water; and history of significant leaks or spills of toxic or hazardous pollutants. Flows with a significant potential for causing erosion shall be identified.

(b) *Inventory of Exposed Materials*—An inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such inventory shall include a narrative description of significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of 3 years prior to the date of the issuance of this permit and the present; method and location of onsite storage or disposal; materials management practices employed to minimize contact

of materials with storm water runoff between the time of 3 years prior to the date of the issuance of this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of any treatment the storm water receives.

(c) *Spills and Leaks*—A list of significant spills and significant leaks of toxic or hazardous pollutants that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility after the date of 3 years prior to the effective date of this permit. Significant spills include, but are not limited to, releases of oil or hazardous substances in excess of quantities that are reportable under Section 311 of the Clean Water Act (CWA) (see 40 CFR 110.10 and 117.21) or Section 102 of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) (see 40 CFR 302.4). Significant spills may also include releases of oil or hazardous substances that are not in excess of reporting requirements and releases of materials that are not classified as oil or a hazardous substance. Such a list shall be updated as appropriate during the term of the permit.

(d) *Sampling Data*—A summary of existing discharge sampling data describing pollutants in storm water discharges from the facility, including a summary of sampling data collected during the term of this permit.

(e) *Risk Identification and Summary of Potential Pollutant Sources*—A narrative description of potential pollutant sources from the following activities: loading and unloading operations; outdoor storage activities, outdoor processing activities; significant dust or particulate generating processes and onsite waste disposal practices. The description shall specifically list any significant potential source of pollutants at the site and for each potential source, any pollutant or pollutant parameter (e.g., Chemical Oxygen Demand (COD), oil and grease, Total Suspended Solids (TSS), zinc, lead, copper, etc.) of concern shall be identified.

(3) *Measures and Controls*. Each facility covered by this permit shall develop a description of storm water management controls appropriate for the facility, and implement such controls. The appropriateness and priorities of controls in a plan shall reflect identified potential sources of pollutants at the facility. The description of storm water management controls for scrap and waste recycling facilities (nonliquid recyclable wastes)

and waste recycling facilities (recyclable liquid wastes) are identified in Parts XI.N.3.a.(3)(a) and XI.N.3.a.(3)(b), respectively. At a minimum, the description shall also include a schedule for implementing such controls:

(a) *Scrap and Waste Recycling Facilities (nonliquid recyclable wastes)*—The following special conditions have been established for the pollution prevention plan for those scrap and waste recycling facilities that receive, process and provide wholesale distribution of nonliquid recyclable wastes, (e.g., ferrous and nonferrous metals, plastics, glass, cardboard, and paper). Under the description of measures and controls in the storm water pollution prevention plan, the plan will address all areas that have a reasonable potential to contribute pollutants to storm water discharges and will be maintained in a clean and orderly manner. At a minimum, the plan will address the following activities and areas within the plan:

(i) *Inbound Recyclable and Waste Material Control Program*—The plan shall include a recyclable and waste material inspection program to minimize the likelihood of receiving materials that may be significant pollutant sources to storm water discharges. At a minimum, the plan shall address the following:

- Measures to encourage suppliers of scrap and recyclable waste materials to drain residual fluids, whenever applicable, prior to its arrival at the facility. This includes vehicles and equipment engines, radiators, and transmissions, oil-filled transformers, white goods (appliances) and individual containers or drums;

- Activities which accept scrap and materials that may contain residual fluids, e.g., automotive engines containing used oil, transmission fluids, etc., shall describe procedures to minimize the potential for these fluids from coming in contact with either precipitation or runoff. The description shall also identify measures or procedures to properly store, handle and dispose of these residual fluids;

- Procedures pertaining to the acceptance of scrap lead-acid batteries. Additional requirements for the handling, storage and disposal or recycling of batteries shall be in conformance with conditions for a scrap lead-acid battery program, see paragraph XI.N.3.a.(3)(a)(v) (below);

- A description of training requirements for those personnel engaged in the inspection and acceptance of inbound recyclable materials.

- Liquid wastes, including used oil, shall be stored in materially compatible and nonleaking containers and disposed or recycled in accordance with all requirements under the Resource Recovery and Conservation Act (RCRA), and other State or local requirements.

- All industrial turnings and cuttings shall be handled in such a manner as to prevent exposure to either precipitation or storm water runoff. Runoff or precipitation that comes in contact with turnings and cuttings shall be discharged into a sump, sanitary sewer, oil/water separator or other equivalent measure to prevent the discharge of reportable quantities of oil.

(ii) *Scrap and Waste Material Stockpiles/Storage (outdoors)*—The plan shall address all areas where significant materials are exposed to either storm water runoff or precipitation. The plan shall describe those measures and controls used to minimize contact of storm water runoff and precipitation with those areas where scrap and recyclable wastes are stockpiled. The plan shall also describe additional measures and controls that are appropriate to minimize contact of any scrap and waste materials that have undergone further processing, (e.g., shredding, baling and compacting, from coming in contact with precipitation or storm water runoff). This includes procedures for the storage and disposal of nonrecyclable wastes and labeling or marking of containerized wastes. The plan shall consider the use, either individually or in combination, of the following Best Management Practices (BMPs) or their equivalent to minimize contact with storm water runoff:

- Diversion devices or structures such as dikes, berms, culverts, containment trenches, elevated concrete pads and/or grading around stockpile areas;

- Permanent or semipermanent covers, or other similar forms of protection over stockpiled materials.

This may also include the use of containment bins or covered dumpsters for processed scrap and recyclable waste materials and nonrecyclable waste materials;

- Retention and detention basins, ponds, sediment traps and/or vegetate swales and strips, to facilitate settling and/or filtering out of pollutants in runoff from material stockpile areas.

- Media filtration such as catch basin filters and sand filters; and

- Oil/water separators and dry absorbents in stockpile areas that are potential sources of residual petroleum-based fluids.

(iii) *Scrap and Waste Material Stockpiles/Storage (covered or indoor storage)*—The plan shall address

measures and controls to minimize residual liquids and accumulated particulate matter, originating from scrap and recyclable waste materials stored indoors or under cover, from coming in contact with surface runoff. This portion of the plan shall include the following:

- Good housekeeping measures, including the use of dry absorbent clean up methods, to collect, handle, store and dispose or recycle residual liquids originating from recyclable containers, e.g., beverage containers, paint cans, household cleaning products containers, etc.;

- Prohibiting the practice of washing down tipping floors or other material processing areas;

- Disconnecting or sealing off all existing floor drains connected to any portion of the storm sewer system.

(iv) *Scrap and Recyclable Waste Processing Equipment*—The plan shall address all areas where scrap and recyclable waste processing equipment are sited. This includes measures and controls to minimize surface runoff from coming in contact with scrap and recyclable waste processing equipment. The plan will specifically address measures to minimize and, wherever feasible, eliminate contact of liquids, e.g., hydraulic fluids, fuel, oils, lubricants and accumulated particulate matter with storm water runoff and precipitation. At a minimum, the plan shall include the following:

- A schedule of periodic inspections of equipment for leaks, spills, malfunctioning, worn or corroded parts or equipment;

- Preventive maintenance program to repair and/or maintain processing equipment according to manufacturer's recommendations;

- Measures to minimize the exposure of precipitation or runoff to processed materials (e.g., shredded scrap, fluff);

- High level alarms or other equivalent protection devices on unattended hydraulic reservoirs over 150 gallons in capacity; and

- In addition to the requirements identified above, the plan shall consider the use of one, or a combination, of the following BMPs or other equivalent practices (note: the permittee may identify BMPs that mutually satisfy requirements for this paragraph and other sections of this permit that address other sources of pollutants, e.g., outdoor material stockpiles): diversion structures such as dikes, berms, culverts, containment trenches, elevated concrete pads, grading to minimize contact of storm water runoff with outdoor processing equipment; oil/water separators, sumps, or dry

absorbents in processing areas that are potential sources of residual petroleum-based compounds and grease; permanent or semipermanent covers, or other similar measures; retention and detention basins, ponds, sediment traps or vegetated swales and strips, to facilitate settling or filtering out of pollutants in runoff from scrap and recyclable waste processing areas; and/or media filtration such as catch basin filters and sand filters.

(v) *Scrap Lead-Acid Battery Program*—The plan shall address measures and controls for the proper handling, storage and disposition of scrap lead-acid batteries. The plan shall include the following:

- All scrap lead-acid batteries shall be segregated from other scrap materials;

- Description of procedures and/or measures for the handling, storage and proper disposal of cracked or broken batteries;

- Description of measures to collect and dispose of leaking battery fluid (lead-acid);

- Description of measures to minimize and, whenever possible, eliminate exposure of scrap lead-acid batteries to precipitation or runoff; and

- Description of employee training for the management of scrap batteries.

(vi) *Erosion and Sediment Control*—The plan shall identify all areas associated with industrial activity that have a high potential for soil erosion. Appropriate stabilization measures, nonstructural and structural controls shall be provided in these areas. The plan shall contain a narrative consideration of the appropriateness for selected erosion and sediment controls. In addition, the plan shall identify nonstructural and structural controls necessary to minimize TSS loadings from those areas that tend to experience a buildup of visible amounts of particulate matter. The plan shall consider the use of one or a combination of the following BMPs:

- Filtering or diversion practices, such as filter fabric fence, sediment filter boom, earthen or gravel berms, curbing or other equivalent measure, placed around exposed significant materials, scrap processing equipment and inlets or catch basins;

- Inlet or catch basin filters or equivalent, place in, or around, inlets or catch basins that receive runoff from scrap and waste storage areas, and processing equipment; and

- Sediment traps, vegetative buffer strips or swales, or equivalent, that effectively trap or remove sediment prior to discharge through an inlet or catch basin. Grassy swales or strips may

also include additional enhancements such as check dams.

(vii) *Structural Controls for Sediment and Erosion Control*—In instances where significant erosion and suspended solids loadings continue after installation of one or more of the BMPs identified in paragraph XI.N.3.a.(3)(a)(vi) (above), the plan shall include a detention or retention basin or other equivalent measure. All structural controls shall be designed using good engineering practice. All structural controls and outlets that are likely to receive discharges containing oil and grease shall include measures to minimize discharge of oil and grease through the outlet riser.

(viii) *Spill Prevention and Response Procedures*—Spills are most likely to occur during processing or loading and unloading of materials. Common causes of spills or leaks include container failures, equipment leaks, and materials handling. Frequent inspections of storage areas and processing equipment will reduce the likelihood that faulty containers and processing equipment will go unnoticed. Employee education and training described below should also reduce the chance of spills occurring. The plan shall include the following practices:

- The plan shall describe spill prevention and response measures to address areas that are potential sources of leaks or spills of fluids;
- All visible leaks and spills shall be contained and cleaned up as soon as possible. If malfunctioning equipment is responsible for the spill or leak, repairs shall also be conducted as soon as possible;
- Cleanup procedures shall be identified in the plan, including the use of dry absorbent materials. The plan shall provide that an adequate supply of dry absorbent material shall be maintained onsite, and used absorbent material shall be cleaned up and disposed of properly;
- Drums containing liquids, including oil and lubricants, shall be stored indoors; or in a bermed area; or in overpack containers or spill pallets; or in similar containment devices;
- Overfill prevention devices shall be installed on all fuel pumps and tanks;
- Drip pans or equivalent measures shall be placed under any leaking piece of stationary equipment until the leak is repaired. The drip pans must be inspected for leaks and checked for potential overflow. They will be emptied regularly to prevent overflow and all liquids will be disposed of in accordance with all requirements under RCRA, and other State and local requirements.

- An alarm and/or pump shut off system shall be installed and maintained on all outside equipment with hydraulic reservoirs exceeding 150 gallons in order to prevent draining the tank contents if a line breaks, provided all parts of the hydraulic system are not visible to the operator of the processing equipment. As an alternative, such equipment may have a secondary containment system capable of containing the contents of the hydraulic reservoir.

(ix) *Monthly Inspection Program*—Aside from the annual site compliance inspection, monthly visual inspections shall be conducted by a member or members of the storm water pollution prevention team. The monthly inspection will include all designated areas of the facility and equipment identified in the plan. The inspection will include a means of tracking and conducting follow up actions based on the results of the inspection. At a minimum, the visual inspection shall include the following areas:

- All outdoor scrap processing areas;
- All material unloading and loading areas (including rail sidings) that are exposed to either precipitation or storm water runoff;
- Areas where structural BMPs have been installed;
- Areas where spills and leaks have occurred in the past;
- All erosion and sediment BMPs;
- Outdoor vehicle and equipment maintenance areas, if applicable;
- Vehicle and equipment fueling areas;
- All areas where waste is generated, received, stored, treated, or disposed and which are exposed to either precipitation or storm water runoff.
- The inspection will include identification of the following if potentially exposed to storm water, corroded and leaking containers, corroded or leaking pipes, leaking or improperly closed valves and valve fittings, leaking pumps and/or hose connections, and breaks in physical barriers used to prevent storm water from reaching stored materials.
- Any spills or leaks identified during the visual inspection will be immediately addressed using the procedures identified in Part XI.N.3.a.(3)(a)(viii) (Spill Prevention and Response Procedures). Structural BMPs will be visually inspected for signs of washout, breakage, deterioration, damage, or overflowing and breaks will be repaired or replaced as expeditiously as possible.

(x) *Employee Training*—At a minimum, training appropriate to their job function shall be provided for truck

drivers, scale operators, supervisors, buyers and operating personnel. The plan shall include a proposed schedule for the training. The employee training program shall address: BMPs and other requirements of the plan; proper scrap inspection, handling and storage procedures; procedures to follow in the event of a spill, leak, or break in any structural BMP. A training and education program shall be developed for employees and for suppliers for implementing activities identified in the storm water pollution prevention plan.

(xi) *Supplier Notification*—The plan shall include a supplier notification program that will be applicable to major suppliers and shall include: description of scrap materials that will not be accepted at the facility or that are accepted only under certain conditions; and the potential liability for future onsite and offsite cleanup costs if hazardous substances are contained in scrap that is delivered to the facility.

(b) *Waste Recycling Facilities (liquid recyclable wastes)*—The following special conditions have been established for the pollution prevention plan for those facilities that reclaim and recycle liquid wastes (e.g., used oil, antifreeze, mineral spirits, and industrial solvents). For these facilities, the storm water pollution prevention plan will address all areas that have a reasonable potential to contribute pollutants to storm water discharges and will be maintained in a clean and orderly manner. At a minimum, the plan will address the following activities and areas within the plan:

(i) *Waste Material Storage (indoors)*—The plan shall address measures and controls to minimize/eliminate residual liquids from waste materials stored indoors from coming in contact with surface runoff. The plan may refer to applicable portions of other existing plans such as SPCC plans required under 40 CFR Part 112. At a minimum, the plan shall include the following:

- Procedures for material handling (including labeling and marking);
- A sufficient supply of dry-absorbent materials or a wet vacuum system to collect spilled or leaked materials;
- An appropriate containment structure, such as trenches, curbing, gutters or other equivalent measures; and
- Drainage system to handle discharges from diked or bermed areas. The drainage system shall include appurtenances, (e.g., pumps or ejectors, manually operated valves). Drainage shall be discharged to an appropriate treatment facility, sanitary sewer system, or otherwise disposed of properly. Discharges from these areas

shall be covered by a separate NPDES permit or industrial user permit under the pretreatment program.

(ii) Waste Material Storage

(outdoors)—The plan shall address areas where significant materials are exposed to either storm water runoff or precipitation. The plan shall include measures to provide appropriate containment, drainage control and other appropriate diversionary structures. The plan may refer to applicable portions of other existing plans such as SPCC plans required under 40 CFR Part 112. At a minimum, the plan shall describe those measures and controls used to minimize contact of storm water runoff with stored materials. The plan shall also include the following preventative measures or the equivalent:

- An appropriate containment structure such as dikes, berms, curbing or pits, or other equivalent measures;
- The containment shall be sufficient to store the volume of the largest single tank and shall include sufficient freeboard for precipitation;
- A sufficient supply of dry-absorbent materials or a wet vacuum system, or other equivalent measure, to collect liquids from minor spills and leaks in contained areas; and
- Discharges of precipitation from contained areas containing used oil shall be in accordance with applicable sections of 40 CFR Part 112.

(iii) Truck and Rail Car Waste Transfer Areas

—The plan shall describe measures and controls for truck and rail car loading and unloading areas. This includes appropriate containment and diversionary structures to minimize contact with precipitation or storm water runoff. The plan shall also address measures to clean up minor spills and/or leaks originating from the transfer of liquid wastes. This may include the use of dry-clean up methods, roof coverings, runoff controls, or other equivalent measures.

(iv) Erosion and Sediment Control

—The plan shall identify all areas associated with industrial activity that have a high potential for soil erosion. Appropriate stabilization measures, nonstructural and structural controls shall be provided in these areas. The plan shall contain a narrative consideration of the appropriateness for selected erosion and sediment controls. Where applicable, the facility shall consider the use of the following types of preventive measures: sediment traps; vegetative buffer strips; filter fabric fence; sediment filtering boom; gravel outlet protection; or other equivalent measures that effectively trap or remove sediment prior to discharge through an inlet or catch basin.

(v) Spill Prevention and Response Procedures

—The plan shall address measures and procedures to address potential spill scenarios that could occur at the facility. This includes all applicable handling and storage procedures, containment and/or diversion equipment, and clean-up procedures. The plan shall specifically address all outdoor and indoor storage areas, waste transfer areas, material receiving areas (loading and unloading), and waste disposal areas.

(vi) Monthly Site Inspections—In addition to the annual site compliance evaluation, the facility shall conduct monthly visual inspections by a member or members of the storm water pollution prevention team. The monthly inspection shall include all designated areas of the facility and equipment identified in the plan. The inspection shall include a means of tracking and conducting follow up actions based on the results of the inspection. At a minimum, the visual inspection shall include the following areas:

- Material storage areas;
- Material unloading and loading areas (including rail sidings) that are exposed to either precipitation or storm water runoff;
- Areas where structural BMPs have been installed;
- All erosion and sediment BMPs;
- Outdoor vehicle and equipment maintenance areas (if applicable);
- Vehicle and equipment fueling areas (if applicable);
- All areas where waste is generated, received, stored, treated, or disposed and which are exposed to either precipitation or storm water runoff; and
- If exposed to precipitation or storm water runoff, the inspection shall identify corroded or leaking containers, corroded or leaking pipes, leaking or improperly closed valves and valve fittings, leaking pumps and/or hose connections, and deterioration in diversionary or containment structures. Any spills or leaks shall be immediately addressed according to the facility's spill prevention and response procedures.

(c) Recordkeeping and Internal Reporting Procedures

—The following record and internal reporting procedures are applicable to all discharges seeking coverage under this permit. The plan shall include a description of incidents (such as spills, or other discharges), along with other information describing the quality and quantity of storm water discharges. Inspections and maintenance activities shall be documented and records of such activities shall be incorporated into the plan. The plan must address

spills, monitoring, and BMP inspection and maintenance activities. BMPs which are ineffective must be reported and the date of their corrective action noted. Employees must report incidents of leaking fluids to facility management and these reports must be incorporated into the plan.

(d) Non-storm Water Discharges.

(i) The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit. Such certification may not be feasible if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit which receives the discharge. In such cases, the source identification section of the storm water pollution plan shall indicate why the certification required by this part was not feasible, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with paragraph XI.N.3.a.(3)(d)(iii) (below).

(ii) Except for flows from fire fighting activities, sources of non-storm water listed in Part III.A. (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

(iii) Failure to Certify—Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director [Insert date 270 days after permit issuance] or, for facilities which begin to discharge storm water associated with industrial activity after [Insert date 270 days after permit issuance], 180 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: the procedure of any test

conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States which are not authorized by an NPDES permit are unlawful, and must be terminated.

(4) *Comprehensive Site Compliance Evaluation.* Qualified personnel shall conduct site compliance evaluations at appropriate intervals specified in the plan, but in no case less than once a year. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with industrial activity shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, and other structural pollution prevention measures identified in the plan shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the inspection, the description of potential pollutant sources identified in the plan in accordance with paragraph XI.N.3.a.(2) of this section (Description of Potential Pollutant Sources) and pollution prevention measures and controls identified in the plan in accordance with paragraph XI.N.3.a.(3) of this section (Measures and Controls) shall be revised as appropriate within 2 weeks of such inspection and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the inspection.

(c) A report summarizing the scope of the inspection, personnel making the inspection, the date(s) of the inspection, major observations relating to the implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph XI.N.3.a.(4)(b) (above) of the permit shall be made and retained as part of the storm water pollution prevention plan for at least 1 year after coverage under this permit terminates. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain

a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) The storm water pollution prevention plan must describe the scope and content of comprehensive site inspections that qualified personnel shall conduct to 1) confirm the accuracy of the description of potential pollution sources contained in the plan, 2) determine the effectiveness of the plan, and 3) assess compliance with the terms and conditions of the permit. Comprehensive site compliance evaluations should be conducted once per year. The individual or individuals who shall conduct the inspections must be identified in the plan and should be members of the pollution prevention team. Inspection reports must be retained for at least 3 years after the date that the permit expires.

4. *Numeric Effluent Limitations.* There are no additional numeric effluent limitations beyond those described in Part V. of this permit.

5. *Monitoring and Reporting Requirements*

a. *Analytical Monitoring Requirements.* During the period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] and the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance], permittees with scrap and waste material processing and recycling facilities must monitor their storm water discharges associated with industrial activity at least quarterly (4 times per year) except as provided in paragraphs 5.a.(3) (Sampling Waiver), 5.a.(4) (Representative Discharge), and 5.a.(5) (Alternative Certification). Scrap and waste material processing and recycling facilities are required to monitor their storm water discharges for the pollutants of concern listed in Table N-1 below. Facilities must report in accordance with 5.b. (Reporting). In addition to the parameters listed in Table N-1 below, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event that generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

TABLE N-1.—MONITORING REQUIREMENTS

| Pollutants of concern | Monitoring cut-off concentration (mg/L) |
|-------------------------------------|---|
| Chemical Oxygen Demand (COD) | 65 |
| Total Kjeldahl Nitrogen (TKN) | 1.5 |
| Nitrate + Nitrite Nitrogen .. | 0.68 |
| Total Recoverable Aluminum | 0.75 |
| Total Recoverable Cadmium | 0.0018 |
| Total Recoverable Copper | 0.009 |
| Total Recoverable Iron | 0.3 |
| Total Recoverable Lead | 0.0337 |
| PCBs | 0.0000044 |
| Total Recoverable Zinc | 0.065 |
| Total Recoverable Arsenic | 0.000018 |

(1) *Monitoring Periods.* Scrap and waste material processing and recycling facilities shall monitor samples collected during the sampling periods of: January to March, April to June, July to September, and October to December for the years specified in paragraph a. (above).

(2) *Sample Type.* A minimum of one grab sample shall be taken. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable. If storm water discharges associated with industrial activity commingle with process or non-process water, then where practicable, permittees must attempt to sample the storm water discharge before it mixes with the non-storm water discharge.

(3) *Sampling Waiver.*

(a) *Adverse Conditions.*—When a discharger is unable to collect samples during one of the monitoring periods specified in paragraph 5.a.(1). (Monitoring Periods) because of adverse climatic conditions, the discharger may collect two samples from the two separate qualifying events in the next monitoring period and submit this data. Adverse weather conditions that may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel

(such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (e.g., drought, extended frozen conditions, etc.).

(b) Low Concentration Waiver.—When the average concentration for a pollutant calculated from all monitoring data collected from an outfall during the monitoring period [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] is less than the corresponding value for that pollutant listed in Table N-1 under the column Monitoring Cut-off Concentration, a facility may waive monitoring and reporting requirements in the monitoring period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance]. The facility must submit to the Director, in lieu of the monitoring data, a certification that there has not been a significant change in industrial activity or the pollution prevention measures in the area of the facility which drains to the outfall for which sampling was waived.

(4) Representative Discharge. When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may test the effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan. The permittee shall include the description of the location of the outfalls, explanation of why outfalls are expected to discharge substantially identical effluents, and estimate of the size of the drainage area and runoff coefficient with the Discharge Monitoring Report.

(5) Alternative Certification. A discharger is not subject to the monitoring requirements of this section provided the discharger makes a certification for a given outfall, on an annual basis, under penalty of law, signed in accordance with Part VII.G.

(Signatory Requirements), that material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, industrial machinery or operations, or significant materials from past industrial activity, that are located in areas of the facility within the drainage area of the outfall are not presently exposed to storm water and are not expected to be exposed to storm water for the certification period. Such certification must be retained in the storm water pollution prevention plan, and submitted to EPA in accordance with Part VI.C. of this permit.

b. Reporting. Permittees with scrap and waste material processing and recycling facilities shall submit monitoring results for each outfall associated with industrial activity [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the reporting period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March [insert the date 2 years after permit issuance]. Monitoring results (or a certification in accordance with Sections (3), (4), or (5) above) obtained during the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance] shall be submitted on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March. A separate Discharge Monitoring Report Form is required for each quarterly sampling period. Signed copies of Discharge Monitoring Reports, or said certifications, shall be submitted to the Director of the NPDES program at the address of the appropriate Regional Office listed in Part VI.C. of the fact sheet.

(1) Additional Notification. In addition to filing copies of discharge monitoring reports in accordance with paragraph b (above), scrap and waste material processing and recycling facilities with at least one storm water discharge associated with industrial activity through a large or medium municipal separate storm sewer system (systems serving a population of 100,000 or more) must submit signed copies of discharge monitoring reports to the operator of the municipal separate storm sewer system in accordance with the dates provided in paragraph b (above).

(c) Monthly Visual Examination of Storm Water Quality. Facilities shall perform and document a visual examination of a representative storm

water discharge associated with industrial activity exposed to storm water. The examination must be made at least once in each month during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(1) Examinations shall be made of samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 1 hour) of when the runoff or snowmelt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The inspection must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Where practicable, the same individual should carry out the collection and examination of discharges for the entire permit term.

(2) Visual observation reports must be maintained onsite in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

3. When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the observation data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or

high (above 65 percent)) shall be provided in the plan.

(4) When a discharger is unable to collect samples over the course of the monitoring period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

O. Storm Water Discharges Associated With Industrial Activity From Steam Electric Power Generating Facilities, Including Coal Handling Areas

1. Discharges Covered Under This Section

2. Eligibility. The requirements listed under this section shall apply to storm water discharges from steam electric power generating facilities, including coal handling areas. Non-storm water discharges subject to effluent limitations guidelines are not covered by this permit. Storm water discharges from coal pile runoff subject to numeric limitations are eligible for coverage under this permit, but are subject to the limitations established by 40 CFR 423.

When an industrial facility, described by the above eligibility provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

If monitoring and pollution prevention plan requirements of another industrial activity section of this permit apply to co-located industrial activities at an industrial facility, the eligibility provisions of that industrial activity section shall not preclude the operator of the industrial facility from complying with the applicable monitoring and pollution prevention plan requirements of that section.

b. Limitations on Coverage. Storm water discharges from ancillary facilities such as fleet centers, gas turbine stations, and substations that are not contiguous to a steam electric power generating facility are not covered by this permit. Heat capture co-generation facilities are not covered by this permit; however, dual fuel co-generation facilities are included.

2. Special Conditions

a. Prohibition of Non-storm Water Discharges. Except as provided under Part III.A. of this permit, non-storm water discharges are not authorized by this permit. The operators of such discharges must obtain coverage under a separate National Pollutant Discharge Elimination System (NPDES) permit if discharged to waters of the United States or through a municipal separate storm sewer system. Storm water discharges associated with industrial activities that are mixed with sources of non-storm water are not authorized by this permit, except if mixed with non-storm water discharges that are in compliance with a different NPDES permit or identified by and in compliance with Part III.A. (Prohibition of Non-storm Water Discharges) of this permit.

3. Storm Water Pollution Prevention Plan Requirements

a. Contents of Plan. The plan shall include, at a minimum, the following items:

(1) *Pollution Prevention Team.* Each plan shall identify a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team that are responsible for developing the storm water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

(2) *Description of Potential Pollutant Sources.* Each plan shall provide a description of potential sources which may reasonably be expected to add significant amounts of pollutants to storm water discharges or which may result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. Each plan shall identify all activities and significant materials which may potentially be significant pollutant sources. Each plan shall include, at a minimum:

(a) *Drainage.*

(i) A site map which clearly outlines the locations of the following, as they apply to the facility: Each point of discharge of storm water associated with industrial activity, and an outline of the drainage area of each storm water outfall that is within the facility boundaries (and indicating the direction of storm water flow); processing areas and buildings; treatment ponds; locations where significant materials are exposed to precipitation; storage tanks; scrap yards, and general refuse areas; fuel storage and distribution areas; vehicle and equipment maintenance and storage areas; loading/unloading areas; locations used for treatment, storage or disposal of wastes; location of short and long term storage of general materials (including but not limited to: supplies, construction materials, plant equipment, oils, fuels, used and unused solvents, cleaning materials, paint, water treatment chemicals, fertilizers, and pesticides); landfills; location of construction sites; locations of stock pile areas (such as coal piles and limestone piles); locations where major spills or leaks identified under Part XI.O.3.a.(2)(c) (Spills and Leaks) of this permit have occurred; surface water bodies; and existing structural control measures to reduce pollutants in storm water runoff (such as bermed areas, grassy swales, etc.).

(ii) For each storm water outfall identify the types of pollutants which are likely to be present in the storm water discharges. Factors to consider include the toxicity of a chemical; quantity of chemicals used, produced or discharged; the likelihood of contact with storm water; and history of significant leaks or spills of toxic or hazardous pollutants. Flows with a significant potential for causing erosion shall be identified.

(b) *Inventory of Exposed Materials—* An inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such inventory shall include a narrative description of significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of 3 years prior to the date of the issuance of this permit and the present; method and location of onsite storage or disposal; materials management practices employed to minimize contact of materials with storm water runoff between the time of 3 years prior to the date of the issuance of this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff;

and a description of any treatment the storm water receives.

(c) *Spills and Leaks*—A list of significant spills and significant leaks of toxic or hazardous pollutants that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility after the date of 3 years prior to the effective date of this permit. Such list shall be updated as appropriate during the term of the permit.

(d) *Sampling Data*—A summary of existing discharge sampling data describing pollutants in storm water discharges from the facility, including a summary of sampling data collected during the term of this permit.

(e) *Risk Identification and Summary of Potential Pollutant Sources*—A narrative description of the potential pollutant sources from the following activities: loading and unloading operations; outdoor storage activities; outdoor manufacturing or processing activities; significant dust or particulate generating processes; and onsite waste disposal practices. The description shall specifically list any significant potential source of pollutants at the site and for each potential source, any pollutant or pollutant parameter (e.g., total suspended solids, copper, etc.) of concern shall be identified.

(3) *Measures and Controls*. Each facility covered by this permit shall develop a description of storm water management controls appropriate for the facility, and implement such controls. The appropriateness and priorities of controls in a plan shall reflect identified potential sources of pollutants at the facility. The description of storm water management controls shall address the following minimum components, including a schedule for implementing such controls:

(a) *Good Housekeeping*—Good housekeeping requires the maintenance of areas which may contribute pollutants to storm water discharges in a clean, orderly manner. The following areas must be specifically addressed:

(i) *Fugitive Dust Emissions*—The plan must describe measures that prevent or minimize fugitive dust emissions from coal handling areas. The facility shall establish procedures to minimize offsite tracking of coal dust. To prevent offsite tracking the facility may consider specially designed tires, or washing vehicles in a designated area before they leave the site, and controlling the wash water.

(ii) *Delivery Vehicles*—The plan must describe measures that prevent or minimize contamination of storm water runoff from delivery vehicles arriving

on the plant site. At a minimum the facility must:

- Develop procedures for the inspection of delivery vehicles arriving on the plant site, and ensure overall integrity of the body or container; and
- Develop procedures to deal with leakage or spillage from vehicles or containers, and ensure that proper protective measures are available for personnel and environment.

(iii) *Fuel Oil Unloading Areas*—The plan must describe measures that prevent or minimize contamination of storm water runoff from fuel oil unloading areas. At a minimum the facility must use the following measures or their equivalent:

- Use containment curbs in unloading areas;
- During deliveries station personnel familiar with spill prevention and response procedures must be present to ensure that any leaks or spills are immediately contained and cleaned up; and
- Use spill and overflow protection (drip pans, drip diapers, and/or other containment devices shall be placed beneath fuel oil connectors to contain any spillage that may occur during deliveries or due to leaks at such connectors).

(iv) *Chemical Loading/Unloading Areas*—The plan must describe measures that prevent or minimize the contamination of storm water runoff from chemical loading/unloading areas. At a minimum the permittee must use the following measures or their equivalent:

- Use containment curbs at chemical loading/unloading areas to contain spills; and
- During deliveries station personnel familiar with spill prevention and response procedures must be present to ensure that any leaks or spills are immediately contained and cleaned up.

Where practicable, chemical loading/unloading areas should be covered, and chemicals should be stored indoors.

(v) *Miscellaneous Loading/Unloading Areas*—The plan must describe measures that prevent or minimize the contamination of storm water runoff from loading and unloading areas. The facility may consider covering the loading area, minimizing storm water runoff to the loading area by grading, berming, or curbing the area around the loading area to direct storm water away from the area, or locate the loading/unloading equipment and vehicles so that leaks can be contained in existing containment and flow diversion systems.

(vi) *Liquid Storage Tanks*—The plan must describe measures that prevent or

minimize contamination of storm water runoff from above ground liquid storage tanks. At a minimum the facility must employ the following measures or their equivalent:

- Use protective guards around tanks;
- Use containment curbs;
- Use spill and overflow protection (drip pans, drip diapers, and/or other containment devices shall be placed beneath chemical connectors to contain any spillage that may occur during deliveries or due to leaks at such connectors); and
- Use dry cleanup methods.

(vii) *Large Bulk Fuel Storage Tanks*—The plan must describe measures that prevent or minimize contamination of storm water runoff from liquid storage tanks. At a minimum the facility must employ the following measures or their equivalent:

- Comply with applicable State and Federal laws, including Spill Prevention Control and Countermeasures (SPCC); and
- Containment berms.

(viii) The plan must describe measures to reduce the potential for an oil spill, or a chemical spill. At a minimum the structural integrity of all above ground tanks, pipelines, pumps and other related equipment shall be visually inspected on a weekly basis. All repairs deemed necessary based on the findings of the inspections will be completed immediately to reduce the incidence of spills and leaks occurring from such faulty equipment.

(ix) *Oil Bearing Equipment in Switchyards*—The plan must describe measures to reduce the potential for storm water contamination from oil bearing equipment in switchyard areas. The facility may consider level grades and gravel surfaces to retard flows and limit the spread of spills; collection of storm water runoff in perimeter ditches.

(x) *Residue Hauling Vehicles*—All residue hauling vehicles shall be inspected for proper covering over the load, adequate gate sealing and overall integrity of the body or container. Vehicles without load coverings or adequate gate sealing, or with leaking containers or beds must be repaired as soon as practicable.

(xi) *Ash Loading Areas*—Plant procedures shall be established to reduce and/or control the tracking of ash or residue from ash loading areas including, where practicable, requirements to clear the ash building floor and immediately adjacent roadways of spillage, debris and excess water before each loaded vehicle departs.

(xii) *Areas Adjacent to Disposal Ponds or Landfills*—The plan must

describe measures that prevent or minimize contamination of storm water runoff from areas adjacent to disposal ponds or landfills. The facility must develop procedures to:

- Reduce ash residue which may be tracked on to access roads traveled by residue trucks or residue handling vehicles; and
- Reduce ash residue on exit roads leading into and out of residue handling areas.

(xiii) *Landfills, Scrapyard, General Refuse Sites*—For landfills, scrapyards, and general refuse sites the permittee shall use the applicable Best Management Practices (BMPs) outlined in Part XI.L. of the permit (Storm Water Discharges Associated With Industrial Activity From Landfills and Land Application Sites).

(xiv) *Maintenance Activities*—For vehicle maintenance activities performed on the plant site, the permittee shall use the applicable BMPs outlined in Part XI.P. of the permit (Storm Water Discharges Associated With Industrial Activity From Motor Freight Transportation Facilities, Passenger Transportation Facilities, Rail Transportation Facilities, and United States Postal Service Transportation Facilities).

(xv) *Material Storage Areas*—The plan must describe measures that prevent or minimize contamination of storm water from material storage areas (including areas used for temporary storage of miscellaneous products, and construction materials stored in lay down areas). The facility may consider flat yard grades, runoff collection in graded swales or ditches, erosion protection measures at steep outfall sites (e.g., concrete chutes, riprap, stilling basins), covering lay down areas, storing the materials indoors, covering the material with a temporary covering made of polyethylene, polyurethane, polypropylene, or hypalon. Storm water runoff may be minimized by constructing an enclosure or building a berm around the area.

(b) *Preventive Maintenance*—A preventive maintenance program shall involve timely inspection and maintenance of storm water management devices (e.g., cleaning oil/water separators, catch basins) as well as inspecting and testing facility equipment and systems to uncover conditions that could cause breakdowns or failures resulting in discharges of pollutants to surface waters, and ensuring appropriate maintenance of such equipment and systems.

(c) *Spill Prevention and Response Procedures*—Areas where potential spills which can contribute pollutants to

storm water discharges can occur, and their accompanying drainage points, shall be identified clearly in the storm water pollution prevention plan. Where appropriate, specifying material handling procedures, storage requirements, and use of equipment such as diversion valves in the plan should be considered. Procedures for cleaning up spills shall be identified in the plan and made available to the appropriate personnel. The necessary equipment to implement a clean up should be available to personnel.

(d) *Inspections*—In addition to or as part of the comprehensive site evaluation required under Part XI.O.3.a.(4) of this section, qualified facility personnel shall be identified to inspect the following areas on a monthly basis: coal handling areas, loading/unloading areas, switchyards, fueling areas, bulk storage areas, ash handling areas, areas adjacent to disposal ponds and landfills, maintenance areas, liquid storage tanks, and long term and short term material storage areas. A set of tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections. Records of inspections shall be maintained onsite. Such records are subject to review by the U.S. Environmental Protection Agency, and State, and local agencies with jurisdiction, and must be retained onsite a minimum of 1 year after coverage under this permit expires.

(e) *Employee Training*—Employee training programs shall inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise responsible for storm water management at all levels of responsibility of the components and goals of the storm water pollution prevention plan. Training should address topics such as goals of the pollution prevention plan, spill prevention and control, proper handling procedures for hazardous wastes, good housekeeping and material management practices, and storm water sampling techniques. The pollution prevention plan shall identify periodic dates for such training, but in all cases training must be held at least annually.

(f) *Recordkeeping and Internal Reporting Procedures*—A description of incidents (such as spills, or other discharges), along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. Inspections and maintenance activities shall be documented and records of such activities shall be incorporated into the plan.

(g) *Non-storm Water Discharges.*

(i) The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit. Such certification may not be feasible if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit which receives the discharge. In such cases, the source identification section of the storm water pollution plan shall indicate why the certification required by this part was not feasible, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with paragraph XI.O.3.a.(3)(g)(iii) (below).

(ii) Except for flows from fire fighting activities, sources of non-storm water listed in Part III.A. (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

(iii) *Failure to Certify*—Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director by [Insert date 270 days after permit issuance] or, for facilities which begin to discharge storm water associated with industrial activity after [Insert date 270 days after permit issuance], 180 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: the procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and, why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States which are

not authorized by an NPDES permit are unlawful, and must be terminated.

(h) *Sediment and Erosion Control*—The plan shall identify areas which, due to topography, activities, or other factors, have a high potential for significant soil erosion, and identify structural, vegetative, and/or stabilization measures to be used to limit erosion.

(i) *Construction Activities*—For storm water discharges from construction activities which disturb greater than 5 acres, the permittee shall submit a Notice of Intent (NOI) to be covered under the NPDES General Permit for Storm Water Discharges From Construction Sites.

(j) *Management of Runoff*—The plan shall contain a narrative consideration of the appropriateness of traditional storm water management practices (practices other than those which control the generation or source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. The plan shall provide that measures the permittee determines to be reasonable and appropriate shall be implemented and maintained. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity (see Part XI.O.3.a.(2)) shall be considered when determining reasonable and appropriate measures. Appropriate measures may include: vegetative swales and practices, reuse of collected storm water (such as for a process or as an irrigation source), inlet controls (such as oil/water separators), snow management activities, infiltration devices, and wet detention/retention devices.

(4) *Comprehensive Site Compliance Evaluation*. Qualified personnel shall conduct site compliance evaluations at appropriate intervals specified in the plan, but in no case less than once a year. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with industrial activity shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, and other structural pollution prevention measures identified in the plan shall be observed to ensure that they are

operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the inspection, the description of potential pollutant sources identified in the plan in accordance with Part XI.O.3.a.(2) of this section (Description of Potential Pollutant Sources) and pollution prevention measures and controls identified in the plan in accordance with Part XI.O.3.a.(3) of this section (Measures and Controls) shall be revised as appropriate within 2 weeks of such inspection and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the inspection.

(c) A report summarizing the scope of the inspection, personnel making the inspection, the date(s) of the inspection, major observations relating to the implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph XI.O.3.a.(4)(b) of the permit shall be made and retained as part of the storm water pollution prevention plan for at least 1 year after coverage under this permit terminates. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) Where compliance evaluation schedules overlap with inspections required under 3.a.(3)(d), the compliance evaluation may be conducted in place of one such inspection.

4. Numeric Effluent Limitations

Coal pile runoff is subject to the effluent guidelines described in Part VI.F. of this fact sheet. However, steam electric generating facilities must comply with the requirement of Part VI.F. immediately upon permit issuance. Steam electric generating facilities are not permitted to take 3 years to meet this requirement.

5. Monitoring and Reporting Requirements

a. *Analytical Monitoring Requirements*. During the period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] and the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit

issuance], permittees with steam electric power generating facilities must monitor their storm water discharges associated with industrial activity at least quarterly (4 times per year) except as provided in paragraphs 5.a.(3). (sampling waiver), 5.a.(4). (representative discharge), and 5.a.(5). (alternative certification), steam electric power generating facilities are required to monitor their storm water discharges for the pollutants of concern listed in Table O-1 below. Facilities must report in accordance with 5.b.(reporting). In addition to the parameters listed in Table O-1 (below, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event which generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled;

TABLE O-1.—MONITORING REQUIREMENTS FOR STEAM ELECTRIC POWER GENERATING FACILITIES

| Pollutants of concern | Cut-off concentration (mg/L) |
|-----------------------------|------------------------------|
| Total Recoverable Copper | 0.009 |
| Total Recoverable Aluminum | 0.75 |
| Total Recoverable Arsenic | 0.000018 |
| Total Recoverable Iron | 0.3 |
| Total Recoverable Lead | 0.0337 |
| Total Recoverable Manganese | 0.05 |

(1) *Monitoring Periods*. Steam electric power generating facilities shall monitor samples collected during the sampling periods of: January to March, April to June, July to September, and October to December for the years specified in paragraph a (above).

(2) *Sample Type*. A minimum of one grab sample shall be taken. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable. If storm water discharges associated

with industrial activity commingle with process or nonprocess water, then where practicable permittees must attempt to sample the storm water discharge before it mixes with the non-storm water discharge.

(3) Sampling Waiver.

(a) Adverse Conditions.—When a discharger is unable to collect samples during one of the monitoring periods specified in paragraph b. (monitoring periods) due to adverse climatic conditions, the discharger may collect two samples from the two separate qualifying events in the next monitoring period and submit this data. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(b) Low Concentration Waiver.—When the average concentration for a pollutant calculated from all monitoring data collected from an outfall during the monitoring period [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] is less than the corresponding value for that pollutant listed in Table Q-1 under the column Monitoring Cut-off Concentration, a facility may waive monitoring and reporting requirements in the monitoring period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance]. The facility must submit to the Director, in lieu of the monitoring data, a certification that there has not been a significant change in industrial activity or the pollution prevention measures in area of the facility which drains to the outfall for which sampling was waived.

(4) Representative Discharge. When a facility has 2 or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may test the effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfalls provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explaining in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area

(in square feet) and an estimate of the runoff coefficient of the drainage area (e.g., low (under 40 percent), medium (40 to 65 percent) or high (above 65 percent)) shall be provided in the plan. The permittee shall include the description of the location of the outfalls, explanation of why outfalls are expected to discharge substantially identical effluents, and estimate of the size of the drainage area and runoff coefficient with the Discharge Monitoring Report.

(5) Alternative Certification. A discharger is not subject to the monitoring requirements of this section provided the discharger makes a certification for a given outfall, on an annual basis, under penalty of law, signed in accordance with Part VII.G. (signatory requirements), that material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, industrial machinery or operations, significant materials from past industrial activity, or, in the case of airports, deicing activities, that are located in areas of the facility within the drainage area of the outfall are not presently exposed to storm water and are not expected to be exposed to storm water for the certification period. Such certification must be retained in the storm water pollution prevention plan, and submitted to EPA in accordance with Part VI.C. of this permit.

b. Reporting. Permittees with steam electric power generating facilities shall submit monitoring results, or a certification that there has not been a significant change in industrial activity or the pollution prevention measures in area of the facility which drains to the outfall for which sampling was waived, obtained during the reporting period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March [insert the date 2 years after permit issuance]. Monitoring results, or a certification that there has not been a significant change in industrial activity or the pollution prevention measures in area of the facility which drains to the outfall for which sampling was waived, obtained during the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance] shall be submitted on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March. A separate Discharge Monitoring Report Form is required for each quarterly sampling period. Signed copies of Discharge

Monitoring Reports, or said certifications, shall be submitted to the Director of the NPDES program at the address of the appropriate Regional Office listed in VI.G. of the fact sheet to this permit.

(1) Additional Notification. In addition to filing copies of discharge monitoring reports in accordance with paragraph b (above) steam electric power generating facilities with at least one storm water discharge associated with industrial activity through a large or medium municipal separate storm sewer system (systems serving a population of 100,000 or more) must submit signed copies of discharge monitoring reports to the operator of the municipal separate storm sewer system in accordance with the dates provided in paragraph b (above).

c. Monthly Visual Examination of Storm Water Quality. Facilities shall perform and document a visual examination of a representative storm water discharge associated with industrial activity exposed to storm water. The examination must be made at least once in each month during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(1) Examinations shall be made of samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed one hour) of when the runoff or snowmelt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The inspection must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Where practicable the same individual should carry out the collection and examination of discharges for entire permit term.

(2) Visual observation reports must be maintained on-site in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution, and probable

sources of any observed storm water contamination.

(3) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the observation data also applies to the substantially identical outfalls provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explaining in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area (e.g. low (under 40 percent), medium (40 to 65 percent) or high (above 65 percent)) shall be provided in the plan.

(4) When a discharger is unable to collect samples over the course of the monitoring period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

P. Storm Water Discharges Associated With Industrial Activity From Motor Freight Transportation Facilities, Passenger Transportation Facilities, Petroleum Bulk Oil Stations and Terminals, Rail Transportation Facilities, and United States Postal Service Transportation Facilities

1. *Discharges Covered Under This Section.* Storm water discharges from ground transportation facilities and rail transportation facilities that have vehicle and equipment maintenance shops (vehicle and equipment rehabilitation, mechanical repairs, painting, fueling and lubrication) and/or equipment cleaning operations are eligible for coverage under this section. The facilities covered by this section of today's proposed permit are commonly identified by standard Industrial Classification (SIC) codes 40, 41, 42, 43, and 5171 or any other facility with vehicle and equipment maintenance shops or cleaning operations.

When an industrial facility, described by the above eligibility provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section.

The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

If monitoring and pollution prevention plan requirements of another industrial activity section of this permit apply to co-located industrial activities at an industrial facility, the eligibility provisions of that industrial activity section shall not preclude the operator of the industrial facility from complying with the applicable monitoring and pollution prevention plan requirements of that section.

2. *Special Conditions.* Prohibition of Non-storm Water Discharges. Prohibited non-storm water discharges, including vehicle and equipment washwaters, are not authorized by this permit. The operators of such discharges must obtain coverage under a separate National Pollutant Discharge Elimination System (NPDES) permit if discharged to waters of the U.S. or through a municipal separate storm sewer system or comply with applicable industrial pretreatment requirements if discharged to a municipal sanitary sewer system.

3. *Storm Water Pollution Prevention Plan Requirements*

a. *Deadlines for Plan Preparation and Compliance.* There are no additional deadlines for plan preparation and compliance, other than those stated in Part IV.A.

b. *Contents of the Plan.* The plan shall include, at a minimum, the following items:

(1) *Pollution Prevention Team.* Each plan shall identify a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team who are responsible for developing the storm water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team

member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

(2) *Description of Potential Pollutant Sources.* Each plan shall provide a description of potential sources which may reasonably be expected to add significant amounts of pollutants to storm water discharges or which may result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. Each plan shall identify all activities and significant materials which may potentially be significant pollutant sources. Each plan shall include, at a minimum:

(a) *Drainage.*—A site map indicating the location of each point of discharge of storm water associated with industrial activity, an outline of the portions of the drainage area of each storm water outfall that are within the facility boundaries (with a prediction of the direction of flow), each existing structural control measure to reduce pollutants in storm water runoff, surface water bodies, locations where significant materials are exposed to precipitation, locations where major spills or leaks identified under Part XI.P.3.b.(2)(c) (Spills and Leaks) of this permit have occurred, and the locations of the following activities: fueling stations, vehicle and equipment maintenance and/or cleaning areas, storage areas for vehicles and equipment awaiting maintenance, loading/unloading areas, locations used for the treatment, storage or disposal of wastes, liquid storage tanks, processing areas, storage areas, and all monitoring locations.

(b) *Inventory of Exposed Materials.*—An inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such inventory shall include a narrative description of significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of 3 years prior to the date of the issuance of this permit and the present; method and location of onsite storage or disposal; dirt or gravel parking areas for storage of vehicles to be maintained; materials management practices employed to minimize contact of materials with storm water runoff between the time of 3 years prior to the date of the issuance of this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of any treatment the storm water receives.

(c) *Spills and Leaks*—A list of significant spills and significant leaks of toxic or hazardous pollutants that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility after the date of 3 years prior to the effective date of this permit. Such list shall be updated as appropriate during the term of the permit.

(d) *Sampling Data*—A summary of existing discharge sampling data describing pollutants in storm water discharges from the facility, including a summary of sampling data collected during the term of this permit.

(e) *Summary of Potential Pollutant Sources*—A narrative description of the potential pollutant sources from the following activities associated with vehicle and equipment maintenance and equipment cleaning: fueling stations; maintenance shops; equipment or vehicle cleaning areas; paved dirt or gravel parking areas for vehicles to be maintained; loading and unloading operations; outdoor storage activities; outdoor manufacturing or processing activities; significant dust or particulate generating processes; and onsite waste disposal practices. The description shall specifically list any significant potential source of pollutants at the site and for each potential source, any pollutant or pollutant parameter (e.g., oil and grease, etc.) of concern shall be identified.

(3) *Measures and Controls*. Each facility covered by this permit shall develop a description of storm water management controls appropriate for the facility, and implement such controls. The appropriateness and priorities of controls in a plan shall reflect identified potential sources of pollutants at the facility. The description of storm water management controls shall address the following minimum components, including a schedule for implementing such controls:

(a) *Good Housekeeping*—All areas that may contribute pollutants to storm water discharges shall be maintained in a clean, orderly manner. The following areas must be specifically addressed:

(i) *Vehicle and Equipment Storage Areas*—The storage of vehicles and equipment awaiting maintenance must be confined to designated areas (delineated on the site map). The plan must describe measures that prevent or minimize contamination of the storm water runoff from these areas. The facility shall consider the use of drip pans under vehicles and equipment, indoor storage of the vehicles and equipment, installation of berming and diking of this area, use of absorbents, roofing or covering storage areas,

cleaning pavement surface to remove oil and grease, or other equivalent methods.

(ii) *Fueling Areas*—The plan must describe measures that prevent or minimize contamination of the storm water runoff from fueling areas. The facility shall consider covering the fueling area, using spill and overflow protection and cleanup equipment, minimizing runoff/runoff of storm water to the fueling area, using dry cleanup methods, collecting the storm water runoff and providing treatment or recycling, or other equivalent measures.

(iii) *Material Storage Areas*—Storage units of all materials (e.g., used oil, used oil filters, spent solvents, paint wastes, radiator fluids, transmission fluids, hydraulic fluids) must be maintained in good condition, so as to prevent contamination of storm water, and plainly labeled (e.g., "used oil," "spent solvents," etc.). The plan must describe measures that prevent or minimize contamination of the storm water runoff from such storage areas. The facility shall consider indoor storage of the materials, installation of berming and diking of the area, minimizing runoff/runoff of storm water to the areas, using dry cleanup methods, collecting the storm water runoff and providing treatment, or other equivalent methods.

(iv) *Vehicle and Equipment Cleaning Areas*—The plan must describe measures that prevent or minimize contamination of the storm water runoff from all areas used for vehicle and equipment cleaning. The facility shall consider performing all cleaning operations indoors, covering the cleaning operation, ensuring that all washwaters drain to the intended collection system (i.e., not the storm water drainage system unless NPDES permitted), collecting the storm water runoff from the cleaning area and providing treatment or recycling, or other equivalent measures. The discharge of vehicle and equipment wash waters, including tank cleaning operations, are not authorized by this permit and must be covered under a separate NPDES permit or discharged to a sanitary sewer in accordance with applicable industrial pretreatment requirements.

(v) *Vehicle and Equipment Maintenance Areas*—The plan must describe measures that prevent or minimize contamination of the storm water runoff from all areas used for vehicle and equipment maintenance. The facility shall consider performing all maintenance activities indoors, using drip pans, maintaining an organized inventory of materials used in the shop, draining all parts of fluids prior to disposal, prohibiting wet clean up

practices where the practices would result in the discharge of pollutants to storm water drainage systems, using dry cleanup methods, collecting the storm water runoff from the maintenance area and providing treatment or recycling, minimizing runoff/runoff of storm water areas or other equivalent measures.

(vi) *Locomotive Sanding (loading sand for traction) Areas*—The plan must describe measures that prevent or minimize contamination of the storm water runoff from areas used for locomotive sanding. The facility shall consider covering sanding areas, minimizing storm water runoff/runoff, appropriate sediment removal practices to minimize the offsite transport of sanding material by storm water, or other equivalent measures.

(b) *Preventive Maintenance*—A preventive maintenance program shall include timely inspection and maintenance of storm water management devices (e.g., cleaning oil/water separators, catch basins, drip pans, vehicle-mounted drip containment devices) as well as inspecting and testing facility equipment and systems to uncover conditions that could cause breakdowns or failures resulting in discharges of pollutants to surface waters, and ensuring appropriate maintenance of such equipment and systems.

(c) *Spill Prevention and Response Procedures*—Areas where potential spills could contribute pollutants to storm water discharges, and their accompanying drainage points, shall be identified clearly in the storm water pollution prevention plan. Where appropriate, specifying material handling procedures, storage requirements, and use of equipment such as diversion valves in the plan should be considered. Procedures and equipment for cleaning up spills shall be identified in the plan and made available to the appropriate personnel.

(d) *Inspections*—Qualified facility personnel shall be identified to inspect designated equipment and areas of the facility on a monthly basis. The following areas shall be included in all inspections: storage area for vehicles and equipment awaiting maintenance, fueling areas, vehicle and equipment maintenance areas (both indoors and outdoors), material storage areas, vehicle and equipment cleaning areas, and loading and unloading areas. Follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections. Records of inspections shall be maintained. The use of a checklist should be considered by the facility.

(e) *Employee Training*—Employee training programs shall inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise responsible for storm water management of the components and goals of the storm water pollution prevention plan. Training should address topics such as spill response, good housekeeping and material management practices. The pollution prevention plan shall identify how often training will take place; at a minimum, training must be held at least semiannually (twice per calendar year). Employee training must, at a minimum, address the following areas when applicable to a facility: summary of the facility's pollution prevention plan requirements; used oil management; spent solvent management; spill prevention, response and control; fueling procedures; general good housekeeping practices; proper painting procedures; and used battery management.

(f) *Recordkeeping and Internal Reporting Procedures*—A description of incidents (such as spills, or other discharges), along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. Inspections and maintenance activities shall be documented and records of such activities shall be incorporated into the plan.

(g) *Non-storm Water Discharges.*

(i) The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit. Such certification may not be practical if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit which receives the discharge. In such cases, the source identification section of the storm water pollution plan shall indicate why the certification required by this part was not practical, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to

provide the certification required by this paragraph must notify the Director in accordance with Part XI.P.3.b.(3)(iv) (Failure to Certify) of this permit.

(ii) Except for flows from fire fighting activities, sources of non-storm water listed in Part III.A.2. (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

(iii) A copy of the NPDES permit issued for vehicle and equipment washwaters or, if an NPDES permit has not yet been issued, a copy of the pending application must be attached to or referenced in the plan. For facilities that discharge vehicle and equipment washwaters to the sanitary sewer system, the operator of the sanitary system and associated treatment plant must be notified. In such cases, a copy of the notification letter must be attached to the plan. If an industrial user permit is issued under a pretreatment program, a copy of that permit must be attached in the plan. In all cases, any permit conditions or pretreatment requirements must be considered in the plan. If the washwaters are handled in another manner (e.g., hauled offsite), the disposal method must be described and all pertinent documentation (e.g., frequency, volume, destination, etc.) must be attached to the plan.

(iv) *Failure to Certify*—Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director by [Insert date 270 days after permit issuance] or, for facilities which begin to discharge storm water associated with industrial activity after [Insert date 270 days after permit issuance], 180 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: the procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States which are not authorized by an NPDES permit are unlawful, and must be terminated.

(h) *Sediment and Erosion Control*—The plan shall identify areas which, due to topography, activities, or other

factors, have a high potential for significant soil erosion, and identify structural, vegetative, and/or stabilization measures to be used to limit erosion.

(i) *Management of Runoff*—The plan shall contain a narrative consideration of the appropriateness of storm water management practices (practices other than those which control the generation or source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. The plan shall provide for the implementation and maintenance of measures that the permittee determines to be reasonable and appropriate. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity [see XI.P.3.b.(2) (description of potential pollutant sources) of this permit] shall be considered when determining reasonable and appropriate measures. Appropriate measures may include: vegetative swales and practices, reuse of collected storm water (such as for a process or as an irrigation source), inlet controls (such as oil/water separators), snow management activities, infiltration devices, and wet detention/retention devices. If a facility determines that other management measures can attain the same water quality in the storm water discharges as an oil/water separator, the justification must be included in the plan.

(4) *Comprehensive Site Compliance Evaluation.* Qualified personnel shall conduct comprehensive site compliance evaluations at appropriate intervals specified in the plan, but, in no case less than once a year. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with industrial activity shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, and other structural pollution prevention measures identified in the plan shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the inspection, the description of potential

pollutant sources identified in the plan in accordance with Part XI.P.3.b.(2) (Description of Potential Pollutant Sources) of this permit and pollution prevention measures and controls identified in the plan in accordance with paragraph XI.P.3.b.(3) (Measures and Controls) of this permit shall be revised as appropriate within 2 weeks of such inspection and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the inspection.

(c) A report summarizing the scope of the inspection, personnel making the inspection, the date(s) of the inspection, major observations relating to the implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph XI.P.3.b.(3)(b) (above) of the permit shall be made and retained as part of the storm water pollution prevention plan for at least 1 year after coverage under this permit terminates. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) Where compliance evaluation schedules overlap with inspections required under 3.a.(3)(d), the compliance evaluation may be conducted in place of one such inspection.

4. Numeric Effluent Limitations. There are no additional numeric effluent limitations beyond those described in Part V. of this permit.

5. Monitoring and Reporting Requirements

a. Monitoring Requirements.

(1) **Quarterly Visual Examination of Storm Water Quality.** Facilities shall perform and document a visual examination of a representative storm water discharge associated with industrial activity exposed to storm water. The examination must be made at least once in each designated period [described in (a), below] during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(a) Examinations shall be conducted in each of the following periods for the purposes of visually inspecting storm water quality associated with storm water runoff or snow melt: December to February; March to May; June to August; and September to November.

(b) Examinations shall be made of samples collected within the first 30

minutes (or as soon thereafter as practical, but not to exceed one hour) of when the runoff or snowmelt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The inspection must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. EPA expects that whenever practicable the same individual will carry out the collection and examination of discharges for the life of the permit.

When a discharger is unable to collect samples over the course of the monitoring period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricanes, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(c) Visual observation reports must be maintained onsite in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

(d) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the observation data also applies to the substantially identical outfalls provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explaining in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each

outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

O. Storm Water Discharges Associated With Industrial Activity From Water Transportation Facilities That Have Vehicle Maintenance Shops and/or Equipment Cleaning Operations

1. Discharges Covered Under This Section. The requirements listed under this section shall apply to storm water discharges from water transportation facilities that have vehicle (vessel) maintenance shops and/or equipment cleaning operations. The water transportation industry includes facilities engaged in foreign or domestic transport of freight or passengers in deep sea or inland waters; marine cargo handling operations; ferry operations; towing and tugboat services; and marinas. These facilities are commonly identified by Standard Industrial Classification (SIC) code Major Group 44.

Storm water discharges from water transportation facilities that have vehicle (vessel) and equipment maintenance shops (vehicle and equipment rehabilitation, mechanical repairs, painting, fueling and lubrication) and/or equipment cleaning operations.

When an industrial facility, described by the above eligibility provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

If monitoring and pollution prevention plan requirements of another industrial activity section of this permit apply to co-located industrial activities at an industrial facility, the eligibility provisions of that industrial activity section shall not preclude the operator of the industrial facility from complying with the applicable monitoring and

pollution prevention plan requirements of that section.

2. Special Conditions

a. Prohibition of Non-storm Water Discharges. Prohibited non-storm water discharges of wastewaters, such as bilge and ballast water, sanitary wastes, and cooling water originating from vessels, are not authorized by this permit. The operators of such discharges must obtain coverage under a separate NPDES permit if discharged to waters of the U.S. or through a municipal separate storm sewer system.

b. Authorized Non-storm Water Discharges. Unless more restrictive State or local regulations prohibit such releases, this permit authorizes the discharge of non-storm water from routine external vessel washdown occurring over a containment area on land where appropriate pollution prevention measures have been implemented to ensure that the discharge released contains no visible sheen of oil or grease, detergents or visible solids such as paint particles, barnacles, and algae. Appropriate pollution prevention measures may include the practice of using no detergents or additives in the pressure washing operations and having a filtering screen at the discharge point of the containment or bermed area to remove solids.

3. Storm Water Pollution Prevention Plan Requirements

a. Contents of Plan. The plan shall include, at a minimum, the following items:

(1) **Pollution Prevention Team.** Each plan shall identify a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team who are responsible for developing the storm water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

(2) **Description of Potential Pollutant Sources.** Each plan shall provide a description of potential sources which may reasonably be expected to add significant amounts of pollutants to storm water discharges or which may result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. Each plan shall identify all activities and significant materials which may potentially be significant pollutant

sources. Each plan shall include, at a minimum:

(a) Drainage.

(i) A site map indicating an outline of the portions of the drainage area of each storm water outfall that are within the facility boundaries, each existing structural control measure to reduce pollutants in storm water runoff, surface water bodies, locations where significant materials are exposed to precipitation, locations where major spills or leaks identified under Part XI.Q.3.a.(2)(c) (Spills and Leaks) of this section have occurred, and the locations of the following activities where such activities are exposed to precipitation: fueling, engine maintenance and repair, vessel maintenance and repair, pressure washing, painting, sanding, blasting, welding, metal fabrication, loading/unloading areas, locations used for the treatment, storage or disposal of wastes; liquid storage tanks, liquid storage areas (i.e., paint, solvents, resins), and material storage areas (i.e., blasting media, aluminum, steel, scrap iron).

(ii) For each area of the facility that generates storm water discharges associated with industrial activity with a reasonable potential for containing significant amounts of pollutants, a prediction of the direction of flow, and an identification of the types of pollutants which are likely to be present in storm water discharges associated with industrial activity. Factors to consider include the toxicity of chemical; quantity of chemicals used, produced or discharged; the likelihood of contact with storm water; and history of significant leaks or spills of toxic or hazardous pollutants. Flows with a significant potential for causing erosion shall be identified.

(b) **Inventory of Exposed Materials.** An inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such inventory shall include a narrative description of significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of 3 years prior to the date of the issuance of this permit and the present; method and location of onsite storage or disposal; materials management practices employed to minimize contact of materials with storm water runoff between the time of 3 years prior to the date of the issuance of this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of any treatment the storm water receives.

(c) **Spills and Leaks.** A list of significant spills and significant leaks of toxic or hazardous pollutants that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility after the date of 3 years prior to the effective date of this permit. Such list shall be updated as appropriate during the term of the permit.

(d) **Sampling Data.** A summary of existing discharge sampling data describing pollutants in storm water discharges from the facility, including a summary of sampling data collected during the term of this permit.

(e) **Risk Identification and Summary of Potential Pollutant Sources.** A narrative description of the potential pollutant sources from the following activities if applicable: loading and unloading operations; outdoor storage activities; outdoor manufacturing or processing activities (i.e., welding, metal fabricating); significant dust or particulate generating processes (i.e., abrasive blasting, sanding, painting); loading/unloading areas; and onsite waste disposal practices. The description shall specifically list any significant potential source of pollutants at the site and for each potential source, any pollutant or pollutant parameter (e.g., biochemical oxygen demand, etc.) of concern shall be identified.

(3) **Measures and Controls.** Each facility covered by this permit shall develop a description of storm water management controls appropriate for the facility, and implement such controls. The appropriateness and priorities of controls in a plan shall reflect identified potential sources of pollutants at the facility. The description of storm water management controls shall address the following minimum components, including a schedule for implementing such controls:

(a) **Good Housekeeping.** Good housekeeping requires the maintenance of areas which may contribute pollutants to storm water discharges in a clean, orderly manner. The following areas must be specifically addressed, when applicable at a facility:

(i) **Pressure Washing Area.** When pressure washing is used to remove marine growth from vessels, the discharge water must be permitted by an NPDES permit. The pollution prevention plan must describe the measures to collect or contain the discharge from the pressure washing area, detail the method for the removal of the visible solids, describe the method of disposal of the collected solids, and identify where the discharge will be released (i.e., the receiving

waterbody, storm sewer system, sanitary sewer system).

(ii) *Blasting and Painting Areas*—The facility must consider containing all blasting and painting activities to prevent abrasives, paint chips, and overspray from reaching the receiving water or the storm sewer system. The plan must describe measures taken at the facility to prevent or minimize the discharge of spent abrasive, paint chips, and paint into the receiving waterbody and storm sewer system. The facility may consider hanging plastic barriers or tarpaulins during blasting or painting operations to contain debris. Where required, a schedule for cleaning storm systems to remove deposits of abrasive blasting debris and paint chips should be addressed within the plan. The plan should include any standard operating practices with regard to blasting and painting activities. Such included items may be the prohibition of performing uncontained blasting and painting over open water or blasting and painting during windy conditions which can render containment ineffective.

(iii) *Material Storage Areas*—All stored and containerized materials (fuels, paints, solvents, waste oil, antifreeze, batteries) must be stored in a protected, secure location away from drains and plainly labeled. The plan must describe measures that prevent or minimize contamination of the storm water runoff from such storage areas. The facility must specify which materials are stored indoors and consider containment or enclosure for materials that are stored outdoors. Above ground storage tanks, drums, and barrels permanently stored outside must be delineated on the site map with a description of the containment measures in place to prevent leaks and spills. The facility must consider implementing an inventory control plan to prevent excessive purchasing, storage, and handling of potentially hazardous materials. Those facilities where abrasive blasting is performed must specifically include a discussion on the storage and disposal of spent abrasive materials generated at the facility.

(iv) *Engine Maintenance and Repair Areas*—The plan must describe measures that prevent or minimize contamination of the storm water runoff from all areas used for engine maintenance and repair. The facility may consider performing all maintenance activities indoors, maintaining an organized inventory of materials used in the shop, draining all parts of fluids prior to disposal, prohibiting the practice of hosing down the shop floor, using dry cleanup

methods, and/or collecting the storm water runoff from the maintenance area and providing treatment or recycling.

(v) *Material Handling Areas*—The plan must describe measures that prevent or minimize contamination of the storm water runoff from material handling operations and areas (i.e., fueling, paint and solvent mixing, disposal of process wastewater streams from vessels). The facility may consider covering fueling areas; using spill and overflow protection; mixing paints and solvents in a designated area, preferably indoors or under a shed; and minimizing runoff of storm water to material handling areas. Where applicable, the plan must address the replacement or repair of leaking connections, valves, pipes, hoses, and soil chutes carrying wastewater from vessels.

(vi) *Drydock Activities*—The plan must address the routine maintenance and cleaning of the drydock to minimize the potential for pollutants in the storm water runoff. The plan must describe the procedures for cleaning the accessible areas of the drydock prior to flooding and final cleanup after the vessel is removed and the dock is raised. Cleanup procedures for oil, grease, or fuel spills occurring on the drydock must also be included within the plan. The facility should consider items such as sweeping rather than hosing off debris and spent blasting material from the accessible areas of the drydock prior to flooding and having absorbent materials and oil containment booms readily available to contain and cleanup any spills.

(vii) *General Yard Area*—The plan must include a schedule for routine yard maintenance and cleanup. Scrap metal, wood, plastic, miscellaneous trash, paper, glass, industrial scrap, insulation, welding rods, packaging, etc., must be routinely removed from the general yard area. The facility may consider such measures as providing covered trash receptacles in each yard, on each pier, and on board each vessel being repaired.

(b) *Preventive Maintenance*—A preventive maintenance program shall involve timely inspection and maintenance of storm water management devices (e.g., cleaning oil/water separators, sediment traps to ensure that spent abrasives, paint chips, and solids will be intercepted and retained prior to entering the storm drainage system) as well as inspecting and testing facility equipment and systems to uncover conditions that could cause breakdowns or failures resulting in discharges of pollutants to surface waters, and ensuring

appropriate maintenance of such equipment and systems.

(c) *Spill Prevention and Response Procedures*—Areas where potential spills which can contribute pollutants to storm water discharges can occur, and their accompanying drainage points shall be identified clearly in the storm water pollution prevention plan. Where appropriate, specifying material handling procedures, storage requirements, and use of equipment such as diversion valves in the plan should be considered. Procedures for cleaning up spills shall be identified in the plan and made available to the appropriate personnel. The necessary equipment to implement a clean up should be available to personnel.

(d) *Inspections*—Qualified facility personnel shall be identified to inspect designated equipment and areas of the facility on a monthly basis. The following areas shall be included in all inspections: pressure washing area; blasting, sanding, and painting areas; material storage areas; engine maintenance and repair areas; material handling areas; drydock area; and general yard area. A set of tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections. Records of inspections shall be maintained.

(e) *Employee Training*—Employee training programs shall inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise responsible for storm water management at all levels of responsibility of the components and goals of the storm water pollution prevention plan. Training should address topics such as spill response, good housekeeping and material management practices. The pollution prevention plan shall identify how often training will take place, but in all cases training must be held at least semiannually (twice per calendar year). Employee training must, at a minimum, address the following areas when applicable to a facility: used oil management; spent solvent management; proper disposal of spent abrasives; proper disposal of vessel wastewaters, spill prevention and control; fueling procedures; general good housekeeping practices; proper painting and blasting procedures; and used battery management. Employees, independent contractors, and customers must be informed about BMPs and be required to perform in accordance with these practices. The facility must consider posting instructions, easy to read descriptions or graphic depictions of BMPs, spill control/clean-up

equipment and emergency phone numbers in the work areas.

(f) *Recordkeeping and Internal Reporting Procedures*—A description of incidents (such as spills, or other discharges), along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. Inspections and maintenance activities shall be documented and records of such activities shall be incorporated into the plan.

(g) *Non-storm Water Discharges*.

(i) The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit. Such certification may not be feasible if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit which receives the discharge. In such cases, the source identification section of the storm water pollution plan shall indicate why the certification required by this part was not feasible, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with paragraph XI.Q.3.a.(3)(g)(iii) (below).

(ii) Except for flows from fire fighting activities, sources of non-storm water listed in Part III.A. (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge. Non-storm water discharges authorized under Part XI.Q.2.b. may be released independently of storm water discharges.

(iii) *Failure to Certify*—Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director by [Insert date 270 days after permit issuance] or, for facilities which

begin to discharge storm water associated with industrial activity after [Insert date 270 days after permit issuance], 180 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: the procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States which are not authorized by an NPDES permit are unlawful, and must be terminated.

(h) *Sediment and Erosion Control*—The plan shall identify areas which, due to topography, activities, or other factors, have a high potential for significant soil erosion, and identify structural, vegetative, and/or stabilization measures to be used to limit erosion.

(i) *Management of Runoff*—The plan shall contain a narrative consideration of the appropriateness of traditional storm water management practices (practices other than those which control the generation or source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. The plan shall provide that measures that the permittee determines to be reasonable and appropriate shall be implemented and maintained. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity [see paragraph XI.Q.3.a.(2) of this section (Description of Potential Pollutant Sources)] shall be considered when determining reasonable and appropriate measures. Appropriate measures may include: vegetative swales and practices, reuse of collected storm water (such as for a process or as an irrigation source), inlet controls (such as oil/water separators), snow management activities, infiltration devices, and wet detention/retention devices.

(4) *Comprehensive Site Compliance Evaluation*. Qualified personnel shall conduct site compliance evaluations at appropriate intervals specified in the plan, but in no case less than once a year. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with industrial activity (pressure washing area, blasting and sanding areas, painting areas, material storage areas, engine maintenance and repair areas,

material handling areas, and drydock area) shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, and other structural pollution prevention measures identified in the plan shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the inspection, the description of potential pollutant sources identified in the plan in accordance with paragraph XI.Q.3.a.(2) of this section (Description of Potential Pollutant Sources) and pollution prevention measures and controls identified in the plan in accordance with paragraph XI.Q.3.a.(3) of this section (Measures and Controls) shall be revised as appropriate within 2 weeks of such inspection and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the inspection.

(c) A report summarizing the scope of the inspection, personnel making the inspection, the date(s) of the inspection, major observations relating to the implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph XI.Q.3.a.(4)(b) (above) of the permit shall be made and retained as part of the storm water pollution prevention plan for at least 1 year after coverage under this permit terminates. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) Where compliance evaluation schedules overlap with inspections required under 3.a.(3)(d), the compliance evaluation may be conducted in place of one such inspection.

4. *Numeric Effluent Limitations*. There are no additional numeric effluent limitations beyond those described in Part V. of this permit.

5. Monitoring and Reporting Requirements

a. Analytical Monitoring Requirements. During the period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] and the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance], permittees with water transportation facilities must monitor their storm water discharges associated with industrial activity at least quarterly (4 times per year) except as provided in paragraphs 5.a.(3) (Sampling Waiver), 5.a.(4) (Representative Discharge), and 5.a.(5) (Alternative Certification). Water transportation facilities are required to monitor their storm water discharges for the pollutants of concern listed in Table Q-1 below. Facilities must report in accordance with 5.b. (Reporting). In addition to the parameters listed in Table Q-1 below, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event that generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

TABLE Q-1.—MONITORING REQUIREMENTS

| Pollutants of concern | Monitoring cut-off concentration (mg/L) |
|----------------------------------|---|
| Total Recoverable Aluminum | 0.75 |
| Total Recoverable Iron | 0.3 |
| Total Recoverable Lead | 0.0337 |
| Total Recoverable Zinc | 0.065 |
| Chemical Oxygen Demand | 65 |
| Total Suspended Solids | 100 |

(1) **Monitoring Periods.** Water transportation facilities shall monitor samples collected during the sampling periods of: January to March, April to June, July to September, and October to December for the years specified in paragraph a. (above).

(2) **Sample Type.** A minimum of one grab sample shall be taken. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is

impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable. If storm water discharges associated with industrial activity commingle with process or non-process water, then where practicable permittees must attempt to sample the storm water discharge before it mixes with the non-storm water discharge.

(3) Sampling Waiver.

(a) **Adverse Conditions.**—When a discharger is unable to collect samples during one of the monitoring periods specified in paragraph b. (Monitoring Periods) because of adverse climatic conditions, the discharger may collect two samples from the two separate qualifying events in the next monitoring period and submit this data. Adverse weather conditions that may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(b) **Low Concentration Waiver.**—When the average concentration for a pollutant calculated from all monitoring data collected from an outfall during the monitoring period [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] is less than the corresponding value for that pollutant listed in Table Q-1 under the column Monitoring Cut-off Concentration, a facility may waive monitoring and reporting requirements in the monitoring period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance]. The facility must submit to the Director, in lieu of the monitoring data, a certification that there has not been a significant change in industrial activity or the pollution prevention measures in area of the facility which drains to the outfall for which sampling was waived.

(4) **Representative Discharge.** When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may test the effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution

prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan. The permittee shall include the description of the location of the outfalls, explanation of why outfalls are expected to discharge substantially identical effluents, and estimate of the size of the drainage area and runoff coefficient with the Discharge Monitoring Report.

(5) **Alternative Certification.** A discharger is not subject to the monitoring requirements of this section provided the discharger makes a certification for a given outfall, on an annual basis, under penalty of law, signed in accordance with Part VII.C. (Signatory Requirements), that material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, industrial machinery or operations, or significant materials from past industrial activity that are located in areas of the facility within the drainage area of the outfall are not presently exposed to storm water and are not expected to be exposed to storm water for the certification period. Such certification must be retained in the storm water pollution prevention plan, and submitted to EPA in accordance with Part VI.C. of this permit.

b. Reporting. Permittees with water transportation facilities shall submit monitoring results for each outfall associated with industrial activity [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the reporting period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March [insert the date 2 years after permit issuance]. Monitoring results [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance] shall be submitted on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March. A separate Discharge Monitoring Report Form is required for each quarterly sampling period. Signed copies of

Discharge Monitoring Reports, or said certifications, shall be submitted to the Director of the NPDES program at the address of the appropriate Regional Office listed in Part VI.G. of the fact sheet.

(1) *Additional Notification.* In addition to filing copies of discharge monitoring reports in accordance with paragraph b (above), water transportation facilities with at least one storm water discharge associated with industrial activity through a large or medium municipal separate storm sewer system (systems serving a population of 100,000 or more) must submit signed copies of discharge monitoring reports to the operator of the municipal separate storm sewer system in accordance with the dates provided in paragraph b (above).

c. *Monthly Visual Examination of Storm Water Quality.* Facilities shall perform and document a visual examination of a representative storm water discharge associated with industrial activity exposed to storm water. The examination must be made at least once in each month during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(1) Examinations shall be made of samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 1 hour) of when the runoff or snowmelt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The inspection must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inch in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Where practicable, the same individual should carry out the collection and examination of discharges for entire permit term.

(2) Visual observation reports must be maintained onsite in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable

sources of any observed storm water contamination.

(3) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the observation data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

(4) When a discharger is unable to collect samples over the course of the monitoring period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

R. Storm Water Discharges Associated With Industrial Activity From Ship and Boat Building or Repairing Yards

1. *Discharges Covered Under This Section.* The requirements listed under this section shall apply to storm water discharges from ship building and repairing and boat building and repairing.⁶

a. *Eligibility.* Storm water discharges from ship building and repair facilities and boat building and repair facilities under Standard Industrial Classification (SIC) code 373.

When an industrial facility, described by the above eligibility provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all

applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

If monitoring and pollution prevention plan requirements of another industrial activity section of this permit apply to co-located industrial activities at an industrial facility, the eligibility provisions of that industrial activity section shall not preclude the operator of the industrial facility from complying with the applicable monitoring and pollution prevention plan requirements of that section.

2. Special Conditions

a. *Prohibition of Non-storm Water Discharges.* Prohibited non-storm water discharges of wastewaters, such as bilge and ballast water, pressure wash water, sanitary wastes, and cooling water originating from vessels, are not authorized by this permit. The operators of such discharges must obtain coverage under a separate NPDES permit if discharged to waters of the United States or through a municipal separate storm sewer system.

3. Storm Water Pollution Prevention Plan Requirements

a. *Contents of Plan.* The plan shall include, at a minimum, the following items:

(1) *Pollution Prevention Team.* Each plan shall identify a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team that are responsible for developing the storm water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

(2) *Description of Potential Pollutant Sources.* Each plan shall provide a description of potential sources which may reasonably be expected to add significant amounts of pollutants to storm water discharges or which may result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. Each plan

⁶ According to the U.S. Coast Guard, a vessel 65 feet or greater in length is referred to as a ship, and a vessel smaller than 65 feet is a boat.

shall identify all activities and significant materials which may potentially be significant pollutant sources. Each plan shall include, at a minimum:

(a) Drainage.

(i) A site map indicating an outline of the portions of the drainage area of each storm water outfall that are within the facility boundaries, each existing structural control measure to reduce pollutants in storm water runoff, surface water bodies, locations where significant materials are exposed to precipitation, locations where major spills or leaks identified under Part XI.R.3.a.(2)(c) (Spills and Leaks) of this section have occurred, and the locations of the following activities where such activities are exposed to precipitation: fueling, engine maintenance and repair, vessel maintenance and repair, pressure washing, painting, sanding, blasting, welding, metal fabrication, loading/unloading areas, locations used for the treatment, storage or disposal of wastes; liquid storage tanks, liquid storage areas (i.e., paint, solvents, resins), and material storage areas (i.e., blasting media, aluminum, steel, scrap iron).

(ii) For each area of the facility that generates storm water discharges associated with industrial activity with a reasonable potential for containing significant amounts of pollutants, a prediction of the direction of flow, and an identification of the types of pollutants which are likely to be present in storm water discharges associated with industrial activity. Factors to consider include the toxicity of a chemical; quantity of chemicals used, produced or discharged; the likelihood of contact with storm water; and history of significant leaks or spills of toxic or hazardous pollutants. Flows with a significant potential for causing erosion shall be identified.

*(b) Inventory of Exposed Materials—*An inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such inventory shall include a narrative description of significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of 3 years prior to the date of the issuance of this permit and the present; method and location of onsite storage or disposal; materials management practices employed to minimize contact of materials with storm water runoff between the time of 3 years prior to the date of the issuance of this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff;

and a description of any treatment the storm water receives.

*(c) Spills and Leaks—*A list of significant spills and significant leaks of toxic or hazardous pollutants that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility after the date of 3 years prior to the effective date of this permit. Such list shall be updated as appropriate during the term of the permit.

*(d) Sampling Data—*A summary of existing discharge sampling data describing pollutants in storm water discharges from the facility, including a summary of sampling data collected during the term of this permit.

*(e) Risk Identification and Summary of Potential Pollutant Sources—*A narrative description of the potential pollutant sources from the following activities if applicable: loading and unloading operations; outdoor storage activities; outdoor manufacturing or processing activities (i.e., welding, metal fabricating); significant dust or particulate generating processes (i.e., abrasive blasting, sanding, painting); loading/unloading areas; and onsite waste disposal practices. The description shall specifically list any significant potential source of pollutants at the site and for each potential source, any pollutant or pollutant parameter (e.g., biochemical oxygen demand, etc.) of concern shall be identified.

(3) Measures and Controls. Each facility covered by this permit shall develop a description of storm water management controls appropriate for the facility, and implement such controls. The appropriateness and priorities of controls in a plan shall reflect identified potential sources of pollutants at the facility. The description of storm water management controls shall address the following minimum components, including a schedule for implementing such controls:

*(a) Good Housekeeping—*Good housekeeping requires the maintenance of areas which may contribute pollutants to storm water discharges in a clean, orderly manner. The following areas must be specifically addressed, when applicable at a facility:

*(i) Pressure Washing Area—*When pressure washing is used to remove marine growth from vessels, the discharge water must be permitted as a process wastewater by an NPDES permit.

*(ii) Blasting and Painting Areas—*The facility must consider containing all blasting and painting activities to prevent abrasives, paint chips, and overspray from reaching the receiving

water or the storm sewer system. The plan must describe measures taken at the facility to prevent or minimize the discharge of spent abrasive, paint chips, and paint into the receiving waterbody and storm sewer system. The facility may consider hanging plastic barriers or tarpaulins during blasting or painting operations to contain debris. Where required, a schedule for cleaning storm systems to remove deposits of abrasive blasting debris and paint chips should be addressed within the plan. The plan should include any standard operating practices with regard to blasting and painting activities. Such included items may be the prohibition of performing uncontained blasting and painting over open water or blasting and painting during windy conditions which can render containment ineffective.

*(ii) Material Storage Areas—*All stored and containerized materials (fuels, paints, solvents, waste oil, antifreeze, batteries) must be stored in a protected, secure location away from drains and plainly labeled. The plan must describe measures that prevent or minimize contamination of the storm water runoff from such storage areas. The facility must specify which materials are stored indoors and consider containment or enclosure for materials that are stored outdoors. Above ground storage tanks, drums, and barrels permanently stored outside must be delineated on the site map with a description of the containment measures in place to prevent leaks and spills. The facility must consider implementing an inventory control plan to prevent excessive purchasing, storage, and handling of potentially hazardous materials. Those facilities where abrasive blasting is performed must specifically include a discussion on the storage and disposal of spent abrasive materials generated at the facility.

*(iv) Engine Maintenance and Repair Areas—*The plan must describe measures that prevent or minimize contamination of the storm water runoff from all areas used for engine maintenance and repair. The facility must consider performing all maintenance activities indoors, maintaining an organized inventory of materials used in the shop, draining all parts of fluids prior to disposal, prohibiting wet clean up practice where the practice would result in the exposure of pollutants to storm water, using dry cleanup methods, and/or collecting the storm water runoff from the maintenance area and providing treatment or recycling.

*(v) Material Handling Areas—*The plan must describe measures that prevent or minimize contamination of

the storm water runoff from material handling operations and areas (i.e., fueling, paint & solvent mixing, disposal of process wastewater streams from vessels). The facility must consider covering fueling areas; using spill and overflow protection; mixing paints and solvents in a designated area, preferably indoors or under a shed; and minimizing runoff of storm water to material handling areas. Where applicable, the plan must address the replacement or repair of leaking connections, valves, pipes, hoses, and soil chutes carrying wastewater from vessels.

(vi) Drydock Activities—The plan must address the routine maintenance and cleaning of the drydock to minimize the potential for pollutants in the storm water runoff. The plan must describe the procedures for cleaning the accessible areas of the drydock prior to flooding and final cleanup after the vessel is removed and the dock is raised. Cleanup procedures for oil, grease, or fuel spills occurring on the drydock must also be included within the plan. The facility must consider items such as sweeping rather than hosing off debris and spent blasting material from the accessible areas of the drydock prior to flooding and having absorbent materials and oil containment booms readily available to contain and cleanup any spills.

(vii) General Yard Area—The plan must include a schedule for routine yard maintenance and cleanup. Scrap metal, wood, plastic, miscellaneous trash, paper, glass, industrial scrap, insulation, welding rods, packaging, etc., must be routinely removed from the general yard area. The facility must consider such measures as providing covered trash receptacles in each yard, on each pier, and on board each vessel being repaired.

(b) Preventive Maintenance—A preventive maintenance program shall involve timely inspection and maintenance of storm water management devices (e.g., cleaning oil/water separators, sediment traps to ensure that spent abrasives, paint chips, and solids will be intercepted and retained prior to entering the storm drainage system) as well as inspecting and testing facility equipment and systems to uncover conditions that could cause breakdowns or failures resulting in discharges of pollutants to surface waters, and ensuring appropriate maintenance of such equipment and systems.

(c) Spill Prevention and Response Procedures—Areas where potential spills which can contribute pollutants to storm water discharges can occur, and

their accompanying drainage points shall be identified clearly in the storm water pollution prevention plan. Where appropriate, specifying material handling procedures, storage requirements, and use of equipment such as diversion valves in the plan should be considered. Procedures for cleaning up spills shall be identified in the plan and made available to the appropriate personnel. The necessary equipment to implement a clean up should be available to personnel.

(d) Inspections—Qualified facility personnel shall be identified to inspect designated equipment and areas of the facility on a monthly basis. The following areas shall be included in all inspections: pressure washing area; blasting, sanding, and painting areas; material storage areas; engine maintenance and repair areas; material handling areas; drydock area; and general yard area. A set of tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections. Records of inspections shall be maintained.

(e) Employee Training—Employee training programs shall inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise responsible for storm water management at all levels of responsibility of the components and goals of the storm water pollution prevention plan. The pollution prevention plan shall identify how often training will take place, but in all cases training must be held at least semiannually (twice per calendar year). Employee training must, at a minimum, address the following areas when applicable to a facility: used oil management; spent solvent management; proper disposal of spent abrasives; proper disposal of vessel wastewaters, spill prevention and control; fueling procedures; general good housekeeping practices; proper painting and blasting procedures; and used battery management. Employees, independent contractors, and customers must be informed about BMPs and be required to perform in accordance with these practices. The facility should consider posting easy to read descriptions or graphic depictions of BMPs and emergency phone numbers in the work areas.

(f) Recordkeeping and Internal Reporting Procedures—A description of incidents (such as spills, or other discharges), along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. Inspections and maintenance

activities shall be documented and records of such activities shall be incorporated into the plan.

(g) Non-storm Water Discharges.

(i) The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit. Such certification may not be feasible if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit which receives the discharge. In such cases, the source identification section of the storm water pollution plan shall indicate why the certification required by this part was not feasible, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with paragraph XI.R.3.a.(3)(g)(iii) (below).

(ii) Except for flows from fire fighting activities, sources of non-storm water listed in Part III.A. (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

(iii) Failure to Certify—Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director by [Insert date 270 days after permit issuance] or, for facilities which begin to discharge storm water associated with industrial activity after [Insert date 270 days after permit issuance], 180 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: the procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate

tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States which are not authorized by an NPDES permit are unlawful, and must be terminated.

(h) *Sediment and Erosion Control*—The plan shall identify areas which, due to topography, activities, or other factors, have a high potential for significant soil erosion, and identify structural, vegetative, and/or stabilization measures to be used to limit erosion.

(i) *Management of Runoff*—The plan shall contain a narrative consideration of the appropriateness of traditional storm water management practices (practices other than those which control the generation or source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. The plan shall provide that measures that the permittee determines to be reasonable and appropriate shall be implemented and maintained. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity [see paragraph XI.R.3.a.(2) of this section (Description of Potential Pollutant Sources)] shall be considered when determining reasonable and appropriate measures. Appropriate measures may include: vegetative swales and practices, reuse of collected storm water (such as for a process or as an irrigation source), inlet controls (such as oil/water separators), snow management activities, infiltration devices, and wet detention/retention devices.

(4) *Comprehensive Site Compliance Evaluation*. Qualified personnel shall conduct site compliance evaluations at appropriate intervals specified in the plan, but in no case less than once a year. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with industrial activity including, but not limited to, pressure washing area, blasting and sanding areas, painting areas, material storage areas, engine maintenance and repair areas, material handling areas, and drydock area, shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, and other structural pollution prevention

measures identified in the plan shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the inspection, the description of potential pollutant sources identified in the plan in accordance with paragraph XI.R.3.a.(2) of this section (Description of Potential Pollutant Sources) and pollution prevention measures and controls identified in the plan in accordance with paragraph XI.R.3.a.(3) of this section (Measures and Controls) shall be revised as appropriate within 2 weeks of such inspection and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the inspection.

(c) A report summarizing the scope of the inspection, personnel making the inspection, the date(s) of the inspection, major observations relating to the implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph XI.R.3.a.(4)(b) (above) of the permit shall be made and retained as part of the storm water pollution prevention plan for at least 1 year after coverage under this permit terminates. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) Where compliance evaluation schedules overlap with inspections required under 3.a.(3)(d), the compliance evaluation may be conducted in place of one such inspection.

4. *Numeric Effluent Limitations*. There are no additional numeric effluent limitations beyond those described in Part V. of this permit.

5. *Monitoring and Reporting Requirements*

a. *Analytical Monitoring Requirements*. During the period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] and the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance], permittees with ship and boat building and repair facilities must monitor their storm water discharges associated with industrial activity at

least quarterly (4 times per year) except as provided in paragraphs 5.a.(3) (Sampling Waiver), 5.a.(4) (Representative Discharge), and 5.a.(5) (Alternative Certification). Ship and boat building and repair facilities are required to monitor their storm water discharges for the pollutants of concern listed in Table R-1 below. Facilities must report in accordance with 5.b. (Reporting). In addition to the parameters listed in Table R-1 below, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event that generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

TABLE R-1.—MONITORING REQUIREMENTS

| Pollutants of concern | Monitoring cut-off concentration (mg/L) |
|-------------------------------|---|
| Total Recoverable Copper ... | .009 |
| Total Recoverable Zinc | .065 |
| Total Recoverable Iron | .3 |
| Total Recoverable Lead | .0337 |
| Total Recoverable Arsenic ... | .000018 |
| Nitrate + Nitrite as N | 0.68 |

(1) *Monitoring Periods*. Ship and boat building and repair facilities shall monitor samples collected during the sampling periods of: January to March, April to June, July to September, and October to December for the years specified in paragraph a. (above).

(2) *Sample Type*. A minimum of one grab sample shall be taken. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable. If storm water discharges associated with industrial activity commingle with process or non-process water, then where practicable permittees must attempt to sample the storm water discharge before it mixes with the non-storm water discharge.

(3) Sampling Waiver.

(a) Adverse Conditions.—When a discharger is unable to collect samples during one of the monitoring periods specified in paragraph b. (Monitoring Periods) because of adverse climatic conditions, the discharger may collect two samples from the two separate qualifying events in the next monitoring period and submit this data. Adverse weather conditions that may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricanes, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(b) Low Concentration Waiver.—When the average concentration for a pollutant calculated from all monitoring data collected from an outfall during the monitoring period [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] is less than the corresponding value for that pollutant listed in Table R-1 under the column Monitoring Cut-off Concentration, a facility may waive monitoring and reporting requirements in the monitoring period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance]. The facility must submit to the Director, in lieu of the monitoring data, a certification that there has not been a significant change in industrial activity or the pollution prevention measures in area of the facility which drains to the outfall for which sampling was waived.

(4) Representative Discharge. When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may test the effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan. The permittee

shall include the description of the location of the outfalls, explanation of why outfalls are expected to discharge substantially identical effluents, and estimate of the size of the drainage area and runoff coefficient with the Discharge Monitoring Report.

(5) Alternative Certification. A discharger is not subject to the monitoring requirements of this section provided the discharger makes a certification for a given outfall, on an annual basis, under penalty of law, signed in accordance with Part VII.G. (Signatory Requirements), that material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, industrial machinery or operations, or significant materials from past industrial activity that are located in areas of the facility within the drainage area of the outfall are not presently exposed to storm water and are not expected to be exposed to storm water for the certification period. Such certification must be retained in the storm water pollution prevention plan, and submitted to EPA in accordance with Part VI.C. of this permit.

b. Reporting. Permittees with ship and boat building and repair facilities shall submit monitoring results for each outfall associated with industrial activity [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the reporting period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March [insert the date 2 years after permit issuance]. Monitoring results [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance] shall be submitted on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March. A separate Discharge Monitoring Report Form is required for each quarterly sampling period. Signed copies of Discharge Monitoring Reports, or said certifications, shall be submitted to the Director of the NPDES program at the address of the appropriate Regional Office listed in Part VI.G. of the fact sheet.

(1) Additional Notification. In addition to filing copies of discharge monitoring reports in accordance with paragraph b (above), Ship and boat building and repair facilities with at least one storm water discharge associated with industrial activity

through a large or medium municipal separate storm sewer system (systems serving a population of 100,000 or more) must submit signed copies of discharge monitoring reports to the operator of the municipal separate storm sewer system in accordance with the dates provided in paragraph b (above).

c. Monthly Visual Examination of Storm Water Quality. Facilities shall perform and document a visual examination of a representative storm water discharge associated with industrial activity exposed to storm water. The examination must be made at least once in each month during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(1) Examinations shall be made of samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 1 hour) of when the runoff or snowmelt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The inspection must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Where practicable, the same individual should carry out the collection and examination of discharges for entire permit term.

(2) Visual observation reports must be maintained onsite in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

(3) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the observation data also applies to the substantially identical outfall(s) provided that the

permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

(4) When a discharger is unable to collect samples over the course of the monitoring period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

S. Storm Water Discharges Associated With Industrial Activity From Vehicle Maintenance Areas, Equipment Cleaning Areas, or Deicing Areas Located at Air Transportation Facilities

1. Discharges Covered Under This Section. The requirements listed under this section shall apply to storm water discharges from airports, air terminals and flying fields generally classified under Standard Industrial Classification (SIC) code 45 which have vehicle maintenance shops, material handling facilities, equipment cleaning operations or airport deicing operations.

a. Eligibility. Only those portions of the facility that are either involved in vehicle maintenance (including vehicle rehabilitation, mechanical repairs, painting, fueling, and lubrication), equipment cleaning operations, or deicing operations are addressed under this section.

When an industrial facility, described by the above eligibility provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located

industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

If monitoring and pollution prevention plan requirements of another industrial activity section of this permit apply to co-located industrial activities at an industrial facility, the eligibility provisions of that industrial activity section shall not preclude the operator of the industrial facility from complying with the applicable monitoring and pollution prevention plan requirements of that section.

2. Special Conditions

a. Prohibition of Non-storm Water Discharges. Non-storm water discharges including aircraft, ground vehicle, runway and equipment washwaters, and dry weather discharges of deicing/anti-icing chemicals are not authorized by this permit. Operators of such discharges must obtain coverage under a separate National Pollutant Discharge Elimination System (NPDES) permit if discharged to waters of the U.S. or through a municipal separate storm sewer system.

3. Storm Water Pollution Prevention Plan Requirements. The permittee (Airport authority) shall ensure that storm water pollution prevention plans are developed and implemented for areas of the facility occupied by tenants of the airport who conduct operations which result in storm water discharges associated with industrial activity. For the purposes of today's permit, tenants of the airport facility includes airline companies, fixed based operators and other parties which have contracts with the airport authority to conduct business operations on airport property which result in storm water discharges associated with industrial activity as described in paragraph 1 of this section. Plans developed for areas occupied by tenants shall include the requirements specified in this section, and be integrated with the storm water pollution prevention plan for the entire airport. Plan should be developed in accordance with Part IV.A.

a. Contents of Plan. Each plan shall include, at a minimum, the following items:

(1) Pollution Prevention Team. Each plan shall identify a specific individual or individuals as member(s) of a storm water Pollution Prevention Team who are responsible for developing the storm water pollution prevention plan and assisting the facility management in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team

member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

(2) Description of Potential Pollutant Sources. Each plan shall provide a description of potential sources which may reasonably be expected to add significant amounts of pollutants to storm water discharges or which may result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. Each plan shall identify all activities and significant materials which may potentially be significant pollutant sources. Each plan shall include, at a minimum:

(a) Drainage.

(i) A site map indicating an outline of the drainage area of each storm water outfall within the facility boundaries, each existing structural control measure to reduce pollutants in storm water runoff, surface water bodies, locations where significant materials are exposed to precipitation, locations where major spills or leaks identified under paragraph XI.S.3.a.(2)(c) (Spills and Leaks) of this section have occurred, and the locations of the following activities where such activities are exposed to precipitation: aircraft and runway deicing/anti-icing operations; fueling stations; aircraft, ground vehicle and equipment maintenance and/or cleaning areas; storage areas for aircraft, ground vehicles and equipment awaiting maintenance; loading/unloading areas; locations used for the treatment, storage or disposal of wastes, liquid storage tanks, processing areas and storage areas.

(ii) For each area of the facility that generates storm water discharges associated with industrial activity with a reasonable potential for containing significant amounts of pollutants, a prediction of the direction of flow, and an identification of the types of pollutants which are likely to be present in storm water discharges associated with industrial activity. Factors to consider include the toxicity of chemical; quantity of chemicals used, produced or discharged; the likelihood of contact with storm water; and history of significant leaks or spills of toxic or hazardous pollutants. Flows with a significant potential for causing erosion shall be identified.

(iii) The site map developed for the entire airport shall indicate the location of each tenant of the facility that conducts industrial activities as described in Part XI.S.1.a., and incorporate information from the tenants site map (including a description of industrial activities,

significant materials exposed, and existing management practices).

(b) Inventory of Exposed Materials—An inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such inventory shall include a narrative description of significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of 3 years prior to the date of the issuance of this permit and the present; method and location of onsite storage or disposal; materials management practices employed to minimize contact of materials with storm water runoff between the time of 3 years prior to the date of the issuance of this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of any treatment of storm water runoff.

(c) Spills and Leaks—A list of significant spills and significant leaks of toxic or hazardous pollutants that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility after the date of 3 years prior to the effective date of this permit. Such list shall be updated as appropriate during the term of the permit.

(d) Sampling Data—A summary of existing discharge sampling data describing pollutants in storm water discharges from the facility, including a summary of sampling data collected during the term of this permit.

(e) Risk Identification and Summary of Potential Pollutant Sources—A narrative description of the potential pollutant sources from the following activities: aircraft, runway, ground vehicle and equipment maintenance and cleaning; aircraft and runway deicing/anti-icing operations (including apron and centralized aircraft deicing stations, runways, taxiways and ramps); outdoor storage activities; loading and unloading operations; and onsite waste disposal. The description shall specifically list any significant potential source of pollutants at the facility and for each potential source, any pollutant or pollutant parameter [e.g., biochemical oxygen demand (BOD₅), oil and grease, etc.] of concern shall be identified.

Facilities which conduct deicing operations shall maintain a record of the types [including the Material Safety Data Sheets (MSDS)] and monthly quantities of deicing/anti-icing chemicals used by all parties conducting deicing operations at the airport facility.

(3) Measures and Controls. Each facility covered by this permit shall develop a description of storm water management controls appropriate for the facility, and implement such controls. The priority in selecting controls shall reflect identified potential sources of pollutants at the facility. The description of storm water management controls shall address the following minimum components, including a schedule for implementing such controls:

(a) Good Housekeeping—Good housekeeping requires the maintenance of areas which may contribute pollutants to storm water discharges in a clean, orderly manner.

(i) Aircraft, Ground Vehicle and Equipment Maintenance Areas—The permittee should ensure the maintenance of equipment is conducted in designated areas only and clearly identify these areas on the ground and delineate them on the site map. The plan must describe measures that prevent or minimize the contamination of the storm water runoff from all areas used for aircraft, ground vehicle and equipment maintenance (including the maintenance conducted on the terminal apron and in dedicated hangars). Management practices such as performing maintenance activities indoors, maintaining an organized inventory of materials used in the maintenance areas, draining all parts of fluids prior to disposal, preventing the practice of hosing down the apron or hangar floor, using dry cleanup methods, and/or collecting the storm water runoff from the maintenance area and providing treatment or recycling should be considered.

(ii) Aircraft, Ground Vehicle and Equipment Cleaning Areas—The permittee should ensure that cleaning of equipment is conducted in designated areas only and clearly identify these areas on the ground and delineate them on the site map. The plan must describe measures that prevent or minimize the contamination of the storm water runoff from all areas used for aircraft, ground vehicle and equipment cleaning. Management practices such as performing cleaning operations indoors, and/or collecting the storm water runoff from the cleaning area and providing treatment or recycling should be considered.

(iii) Aircraft, Ground Vehicle and Equipment Storage Areas—The storage of aircraft, ground vehicles and equipment awaiting maintenance must be confined to designated areas (delineated on the site map). The plan must describe measures that prevent or minimize the contamination of the

storm water runoff from these areas. Management practices such as indoor storage of aircraft and ground vehicles, the use of drip pans for the collection of fluid leaks, and perimeter drains, dikes or berms surrounding storage areas should be considered.

(iv) Material Storage Areas—Storage units of all materials (e.g., used oils, hydraulic fluids, spent solvents, and waste aircraft fuel) must be maintained in good condition, so as to prevent or minimize contamination of storm water, and plainly labeled (e.g., "used oil," "Contaminated Jet A," etc.). The plan must describe measures that prevent or minimize contamination of the storm water runoff from storage areas. Management practices such as indoor storage of materials, centralized storage areas for waste materials, and/or installation of berming and diking around storage areas should be considered for implementation.

(v) Airport Fuel System and Fueling Areas—The plan must describe measures that prevent or minimize the discharge of fuels to the storm sewer resulting from fuel servicing activities or other operations conducted in support of the airport fuel system. Where the discharge of fuels into the storm sewer cannot be prevented, the plan shall indicate measures that will be employed to prevent or minimize the discharge of the contaminated runoff into receiving surface waters. Management practices such as implementing spill and overflow practices (e.g., placing sorptive materials beneath aircraft during fueling operations), using dry cleanup methods, and/or collecting the storm water runoff should be considered.

(b) Preventive Maintenance—A preventive maintenance program shall involve timely inspection and maintenance of storm water management devices (e.g., cleaning oil/water separators, removing debris from catch basins) as well as inspecting and testing facility equipment and systems to uncover conditions that could cause breakdowns or failures resulting in discharges of pollutants to surface waters, and ensuring appropriate maintenance of such equipment and systems.

(c) Spill Prevention and Response Procedures—Areas where potential spills which can contribute pollutants to storm water discharges can occur, and their accompanying drainage points shall be identified clearly in the storm water pollution prevention plan. The plan shall describe material handling procedures, storage requirements, and consider the use of equipment such as diversion valves. Procedures for cleaning up spills shall be identified in

the plan and made available to the appropriate personnel. The necessary equipment to implement a clean up should be available to personnel.

(d) *Source Reduction*—Facilities which conduct aircraft and/or runway (including taxiways and ramps) deicing/anti-icing operations shall evaluate present operating procedures to consider alternative practices to reduce the overall amount of deicing/anti-icing chemicals used and/or lessen the environmental impact of the pollutant source.

(i) With regard to runway deicing/anti-icing operations, facilities, at a minimum, shall evaluate: present application rates to ensure against excessive over application; metered application of deicing/anti-icing chemical; pre-wetting dry chemical constituents prior to application; installation of runway ice detection systems; implementing anti-icing operations as a preventive measure against ice buildup; and the use of substitute deicing compounds such as potassium acetate in lieu of ethylene glycol and/or urea.

(ii) In considering alternative management practices for aircraft deicing operations, facilities should evaluate current application rates and practices to ensure against excessive over application, and pretreating aircraft with hot water prior to the application of a deicing chemical, thus reducing the overall amount of chemical used per operation.

Source reduction measures that the facility determines to be reasonable and appropriate shall be implemented and maintained. The plan shall provide a narrative explanation of the options considered and the reasoning for whether or not to implement them.

(g) *Management of Runoff*—The plan shall contain a narrative consideration of the appropriateness of traditional storm water management practices (practices other than those which prevent or reduce source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity [see paragraph XLS.3.a.(2) of this section (Description of Potential Pollutant Sources)] shall be considered.

Appropriate measures may include: vegetative swales, reuse of collected storm water (such as for a process or as an irrigation source), inlet controls (such as oil/water separators), snow management activities, infiltration

devices, and wet detention/retention devices. Measures that the permittee determines to be reasonable and appropriate shall be implemented and maintained.

(i) Facilities which conduct aircraft and/or runway deicing/anti-icing operations shall also provide a narrative consideration of management practices to control or manage contaminated runoff from areas where deicing/anti-icing operations occur to reduce the amount of pollutants being discharged from the site. Structural controls such as establishing a centralized aircraft deicing facility, and/or collection of contaminated runoff for treatment or recycling should be considered.

Collection and treatment alternatives include, but are not limited to, retention basins, detention basins with metered controlled release, Underground Storage Tanks (USTs) and/or disposal to Publicly Owned Treatment Works (POTW) by way of sanitary sewer or hauling tankers. Runoff management controls that the facility determines to be reasonable and appropriate shall be implemented and maintained. The plan should consider the recovery of deicing/anti-icing materials when these materials are applied during non-precipitation events. The plan shall provide a narrative explanation of the controls considered and the reasoning for whether or not to implement them.

(f) *Inspections*—In addition to or as part of the comprehensive site evaluation required under paragraph XLS.3.a.(4) of this section, qualified facility personnel shall be identified to inspect designated equipment and areas of the facility specified in the plan. The inspection frequency shall be specified in the plan, but at a minimum be conducted once per week during deicing/anti-icing application periods for areas where deicing/anti-icing operations are being conducted. A set of tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections. Records of inspections shall be maintained. The use of a checklist developed by the pollution prevention team is encouraged.

(g) *Pollution Prevention Training*—Pollution prevention training programs shall be developed to inform airport management and tenant personnel responsible for implementing activities identified in the storm water pollution prevention plan of the components and goals of the plan. Training should address topics such as spill response, good housekeeping, aircraft and runway deicing/anti-icing procedures, and material management practices. The

pollution prevention plan shall identify periodic dates for such training.

(h) *Recordkeeping and Internal Reporting Procedures*—A description of incidents (such as spills, or other discharges), along with other information describing the quality and quantity of storm water discharges shall be included in the plan. Inspections and maintenance activities shall be documented and records shall be incorporated into the plan.

(i) *Non-storm Water Discharges.*

(i) The plan shall include a certification that the discharge points have been tested or evaluated for the presence of non-storm water discharges. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit. Such certification may not be feasible if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit which receives the discharge. In such cases, the source identification section of the storm water pollution plan shall indicate why the certification required by this part was not feasible, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with paragraph XLS.3.a.(3)(iii) (below).

(ii) Except for flows from fire fighting activities, other sources of non-storm water listed in Part III.A. (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

(iii) *Failure to Certify*—Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director by [Insert date 270 days after permit issuance] or, for facilities which begin to discharge storm water associated with industrial activity after [Insert date 270 days after permit issuance], 180 days after submitting a

notice of intent to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: the procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States which are not authorized by an NPDES permit are unlawful, and must be terminated.

(j) *Sediment and Erosion Control*—The plan shall identify areas which, due to topography, activities, or other factors, have a high potential for significant soil erosion, and identify structural, vegetative, and/or stabilization measures to be used to limit erosion.

(4) *Comprehensive Site Compliance Evaluation*. Qualified personnel shall conduct site compliance evaluations during periods of deicing/anti-icing operations at appropriate intervals specified in the plan, but in no case less than once a year. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with industrial activity shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, and other structural pollution prevention measures identified in the plan shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the inspection, the description of potential pollutant sources identified in the plan in accordance with paragraph XI.S.3.a.(2) of this section (Description of Potential Pollutant Sources) and pollution prevention measures and controls identified in the plan in accordance with paragraph XI.S.3.a.(3) of this section (Measures and Controls) shall be revised as appropriate within 2 weeks of such inspection and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the inspection.

(c) A report summarizing the scope of the inspection, personnel making the inspection, the date(s) of the inspection, major observations relating to the implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph XI.S.3.a.(4)(b) (above) of the permit shall be made and retained as part of the storm water pollution prevention plan for at least 1 year after coverage under this permit terminates. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) Where compliance evaluation schedules overlap with inspections required under 3.a.(3)(f), the compliance evaluation may be conducted in place of one such inspection.

4. *Numeric Effluent Limitations*. There are no additional numeric effluent limitations beyond those in Part V. of this permit.

5. *Monitoring and Reporting Requirements*

a. During the period beginning on the effective date and lasting through the expiration date of this permit, facilities which conduct aircraft and/or runway deicing/anti-icing operations:

(1) Shall prepare estimates for annual pollutant loadings resulting from discharges of spent deicing chemicals from the facility. The loading estimates shall reflect the amounts of deicing chemicals discharged to separate storm sewer systems or surface waters, prior to and after implementation of the facility's storm water pollution prevention plan. Such estimates shall be reviewed by a Registered Professional Engineer, and certified by such engineer. By means of the certification, the engineer, having examined the facility's, deicing procedures, and proposed control measures described in the storm water pollution prevention plan, shall attest that the loading estimates have been prepared in accordance with good engineering practices. Certified loading estimates are to be retained at the airport facility and attached to the storm water pollution prevention plan.

b. *Analytical Monitoring Requirements*. During the period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] and the period beginning [insert date 3 years

after permit issuance] lasting through [insert date 4 years after permit issuance], airports that use more than 100,000 gallons of glycol-based deicing chemicals and/or 100 tons or more of urea on an average annual basis shall monitor outfalls from the facility that collect runoff from areas where deicing/anti-icing activities occur 4 times during months of deicing (November to March), except as provided in paragraphs 5.a.(3) (Sampling Waiver), 5.a.(4) (Representative Discharge), and 5.a.(5) (Alternative Certification). Airports which are subject to these monitoring requirements must sample their storm water discharges for the pollutants of concern listed in Table S-1 below. Such facilities must report in accordance with 5.b. (Reporting). In addition to the parameters listed in Table S-1 below, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event that generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

TABLE S-1.—MONITORING REQUIREMENTS

| Pollutants of concern | Monitoring cut-off concentration |
|--|----------------------------------|
| Biochemical Oxygen Demand (BOD ₅). | 9 mg/L. |
| Chemical Oxygen Demand (COD). | 65 mg/L. |
| Total Kjeldahl Nitrogen (TKN). | 1.50 mg/L. |
| pH | 6.5 to 9 s.u. |

For the purposes of today's permit, the "average annual" usage rate of deicing/anti-icing chemicals is determined by averaging the amounts of deicing/anti-icing chemicals used at the facility in the 3 previous calendar years.

(1) *Monitoring Periods*. Airports that use more than 100,000 gallons of glycol-based deicing chemicals and/or 100 tons or more of urea on an average annual basis shall monitor outfalls from the facility that collect runoff from areas where deicing/anti-icing activities occur four times per year during periods when deicing/anti-icing activities occur (November to March), in the years specified in paragraph n. (above).

(2) *Sample Type*. A minimum of one grab sample shall be taken. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in

magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable. If storm water discharges associated with industrial activity commingle with process or non-process water, then where practicable permittees must attempt to sample the storm water discharge before it mixes with the non-storm water discharge.

(3) *Sampling Waiver.*

(a) *Adverse Conditions*—When a discharger is unable to collect samples during one of the monitoring periods specified in paragraph b. (Monitoring Periods) because of adverse climatic conditions, the discharger may collect two samples from the two separate qualifying events in the next monitoring period and submit this data. Adverse weather conditions that may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(b) *Low Concentration Waiver*—When the average concentration for a pollutant calculated from all monitoring data collected from an outfall during the monitoring period [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] is less than the corresponding value for that pollutant listed in Table S-1 under the column Monitoring Cut-off Concentration, a facility may waive monitoring and reporting requirements in the monitoring period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance]. The facility must submit to the Director, in lieu of the monitoring data, a certification that there has not been a significant change in industrial activity or the pollution prevention measures in area of the facility which drains to the outfall for which sampling was waived.

(4) *Representative Discharge*. When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes

discharge substantially identical effluents, the permittee may test the effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent); medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan. The permittee shall include the description of the location of the outfalls, explanation of why outfalls are expected to discharge substantially identical effluents, and estimate of the size of the drainage area and runoff coefficient with the Discharge Monitoring Report.

(5) *Alternative Certification*. A discharger is not subject to the monitoring requirements of this section provided the discharger makes a certification for a given outfall, on an annual basis, under penalty of law, signed in accordance with Part VII.G. (Signatory Requirements), that material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, industrial machinery or operations, or significant materials from past industrial activity that are located in areas of the facility within the drainage area of the outfall are not presently exposed to storm water and are not expected to be exposed to storm water for the certification period. Such certification must be retained in the storm water pollution prevention plan, and submitted to EPA in accordance with Part VI.C. of this permit.

c. *Reporting*. Airports shall submit monitoring results for each outfall associated with industrial activity [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the reporting period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March [insert the date 2 years after permit issuance]. Monitoring results [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance] shall be

submitted on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March. A separate Discharge Monitoring Report Form is required for each quarterly sampling period. Signed copies of Discharge Monitoring Reports, or said certifications, shall be submitted to the Director of the NPDES program at the address of the appropriate Regional Office listed in Part VI.G. of the fact sheet.

(1) *Additional Notification*. In addition to filing copies of discharge monitoring reports in accordance with paragraph b (above), facilities with at least one storm water discharge associated with industrial activity through a large or medium municipal separate storm sewer system (systems serving a population of 100,000 or more) must submit signed copies of discharge monitoring reports to the operator of the municipal separate storm sewer system in accordance with the dates provided in paragraph b (above).

T. Storm Water Discharges Associated With Industrial Activity From Treatment Works

1. Discharges Covered Under This Section

a. *Eligibility*. This permit covers all existing point source discharges of storm water from treatment works treating domestic sewage or any other sewage sludge or wastewater treatment device or system, used in the storage, treatment, recycling, and reclamation of municipal or domestic sewage, including lands dedicated to the disposal of sewage sludge that are located within the confines of the facility with a design flow of 1.0 MGD or more, or required to have an approved pretreatment program under 40 CFR Part 403. When an industrial facility, described by the above eligibility provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

If monitoring and pollution prevention plan requirements of another industrial activity section of this permit apply to co-located industrial activities at an industrial facility, the eligibility provisions of that industrial activity section shall not preclude the operator of the industrial facility from complying with the applicable monitoring and pollution prevention plan requirements of that section.

2. Special Conditions

a. Prohibition of Non-storm Water Discharges. Prohibited non-storm water discharges including sanitary and industrial wastewater, and equipment and vehicle washwaters are not authorized by this permit. The operators of such discharges must obtain coverage under a separate NPDES permit if discharged to waters of the U.S. or through a municipal separate storm sewer system.

3. Storm Water Pollution Prevention Plan Requirements

a. Contents of the Plan. The plan shall include, at a minimum, the following items:

(1) Pollution Prevention Team. Each plan shall identify a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team who are responsible for developing the storm water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

(2) Description of Potential Pollutant Sources. Each plan shall provide a description of potential sources which may reasonably be expected to add significant amounts of pollutants to storm water discharges or which may result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. Each plan shall identify all activities and significant materials which may potentially be significant pollutant sources. Each plan shall include, at a minimum:

(a) Drainage. A site map indicating the location of each point of discharge of storm water associated with industrial activity, an outline of the portions of the drainage area of each storm water outfall that are within the facility boundaries (with a prediction of the direction of flow), each existing structural control measure to reduce pollutants in storm water runoff, surface

water bodies, locations where significant materials are exposed to precipitation, locations where major spills or leaks identified under Part III.B. (Spills and Leaks) of this permit have occurred, and the locations of the following activities: fueling areas; vehicle and equipment maintenance and/or cleaning areas; locations used for treatment, storage and disposal areas for wastes, liquid storage tanks, processing areas and storage areas for process chemicals, petroleum products, solvents, fertilizers, herbicides and pesticides; and loading/unloading areas.

(b) Inventory of Exposed Materials. An inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such inventory shall include a narrative description of significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of 3 years prior to the date of the issuance of this permit and the present; method and location of onsite storage or disposal; materials management practices employed to minimize contact of materials with storm water runoff between the time of 3 years prior to the date of the issuance of this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of any treatment the storm water receives.

(c) Spills and Leaks. A list of significant spills and significant leaks of toxic or hazardous pollutants that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility after the date of 3 years prior to the effective date of this permit. Such list shall be updated as appropriate during the term of the permit.

(d) Sampling Data. A summary of existing discharge sampling data describing pollutants in storm water discharges from the facility, including a summary of sampling data collected during the term of this permit.

(e) Summary of Potential Pollutant Sources. A narrative description of the potential pollutant sources from the following activities associated with treatment works: access roads/rail lines; loading and unloading operations; outdoor storage activities; material handling sites; outdoor manufacturing or processing activities; significant dust or particulate generating processes; and onsite waste disposal practices. The description shall specifically list any significant potential source of pollutants at the site and for each potential source, any pollutant or pollutant parameter

(e.g., acid, bases, and solvents, etc.) of concern shall be identified.

(3) Measures and Controls. Each facility covered by this permit shall develop a description of storm water management controls appropriate for the facility, and implement such controls. The appropriateness and priorities of controls in a plan shall reflect identified potential sources of pollutants at the facility. The description of storm water management controls shall address the following minimum components, including a schedule for implementing such controls:

(a) Good Housekeeping. All areas that may contribute pollutants to storm waters discharges shall be maintained in a clean, orderly manner.

(b) Preventive Maintenance. A preventive maintenance program shall involve timely inspection and maintenance of storm water management devices (e.g., cleaning oil/water separators, catch basins) as well as inspecting and testing facility equipment and systems to uncover conditions that could cause breakdowns or failures resulting in discharges of pollutants to surface waters, and ensuring appropriate maintenance of such equipment and systems.

(c) Spill Prevention and Response Procedures. Areas where potential spills which can contribute pollutants to storm water discharges can occur, and their accompanying drainage points, shall be identified clearly in the storm water pollution prevention plan. Where appropriate, specifying material handling procedures, storage requirements, and use of equipment such as diversion valves in the plan should be considered. Procedures and equipment for cleaning up spills shall be identified in the plan and made available to the appropriate personnel.

(d) Inspections. In addition to the comprehensive site evaluation required under Part XI.T.3.a.(4) of this permit, qualified facility personnel shall be identified to inspect designated equipment and areas of the facility on a monthly basis. The following areas shall be included in all inspections: access roads/rail lines, equipment storage and maintenance areas (both indoor and outdoor areas); fueling; material handling areas, residual treatment, storage, and disposal areas; and wastewater treatment areas. A set of tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections. Records of inspections shall be maintained. The use of a checklist developed by the facility is encouraged.

(e) *Employee Training*—Employee training programs shall inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise responsible for storm water management at all levels of responsibility of the components and goals of the storm water pollution prevention plan. Training should address topics such as spill response, good housekeeping and material management practices. The pollution prevention plan shall identify how often training will take place, but in all cases training must be held at least semiannually (twice per calendar year). Employee training must, at a minimum, address the following areas when applicable to a facility: petroleum product management; process chemical management; spill prevention and control; fueling procedures; general good housekeeping practices; proper procedures for using fertilizers, herbicides and pesticides.

(f) *Recordkeeping and Internal Reporting Procedures*—A description of incidents (such as spills, or other discharges), along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. Inspections and maintenance activities shall be documented and records of such activities shall be incorporated into the plan.

(g) *Non-storm Water Discharges.*

(i) The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit. Such certification may not be practical if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit which receives the discharge. In such cases, the source identification section of the storm water pollution plan shall indicate why the certification required by this part was not practical, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in

accordance with Part XI.T.3.a.(3)(g)(iv) (Failure to Certify) of this permit.

(ii) Except for flows from fire fighting activities, sources of non-storm water listed in Part III.A.2. (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

(iii) A copy of all the current NPDES permit issued for wastewater, industrial, vehicle and equipment washwater discharges or, if an NPDES permit has not yet been issued, a copy of the pending application must be attached to the plan. For facilities that discharge vehicle and equipment washwaters to the sanitary sewer system, the operator of the sanitary system and associated treatment plant must be notified. In such cases, a copy of the notification letter must be attached to the plan. If an industrial user permit is issued under a pretreatment program, a copy of that permit must be attached in the plan. In all cases, any permit conditions must be considered in the plan. If the washwaters are handled in another manner (e.g., hauled offsite), the disposal method must be described and all pertinent documentation (e.g., frequency, volume, destination, etc.) must be attached to the plan.

(iv) *Failure to Certify.* Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director by [insert date 270 days after permit issuance] or, for facilities that begin to discharge storm water associated with industrial activity after [insert date 270 days after permit issuance], 180 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notifications shall describe: the procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States that are not authorized by an NPDES permit are unlawful and must be terminated.

(h) *Sediment and Erosion Control*—The plan shall identify areas which, due to topography, activities, or other factors, have a high potential for significant soil erosion, and identify structural, vegetative, and/or

stabilization measures to be used to limit erosion.

(i) *Management of Runoff*—The plan shall contain a narrative consideration of the appropriateness of traditional storm water management practices (practices other than those which control the generation or source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. The plan shall provide that measures that the permittee determines to be reasonable and appropriate shall be implemented and maintained. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity [see Part XI.T.3.a.(2) (Description of Potential Pollutant Sources) of this permit] shall be considered when determining reasonable and appropriate measures. Appropriate measures may include: vegetative swales and practices, reuse of collected storm water (such as for a process or as an irrigation source), inlet controls (such as oil/water separators), snow management activities, infiltration devices, and wet detention/retention devices. If a facility determines that other management measures can attain the same water quality in the storm water discharges as an oil/water separator, the justification must be included in the plan.

(4) *Comprehensive Site Compliance Evaluation*—Qualified personnel shall conduct site compliance evaluations at appropriate intervals specified in the plan, but in no case less than once a year. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with industrial activity shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, and other structural pollution prevention measures identified in the plan shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the inspection, the description of potential pollutant sources identified in the plan in accordance with Part XI.T.3.a.(2) (Description of Potential Pollutant

Sources) of this permit and pollution prevention measures and controls identified in the plan in accordance with paragraph XI.T.3.a.(3) (Measures and Controls) of this permit shall be revised as appropriate within 2 weeks of such inspection and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the inspection.

(c) A report summarizing the scope of the inspection, personnel making the inspection, the date(s) of the inspection, major observations relating to the implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph XI.T.3.a.(4)(b) of the permit shall be made and retained as part of the storm water pollution prevention plan for at least 1 year after coverage under this permit terminates. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) Where compliance evaluation schedules overlap with inspections required under 3.a.(3)(d), the compliance evaluation may be conducted in place of one such inspection.

4. **Numeric Effluent Limitations.** There are no numeric effluent limitations beyond those in Part V.

5. **Monitoring and Reporting Requirements**

a. **Analytical Monitoring Requirements.** During the period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] and the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance], treatment works must monitor their storm water discharges associated with industrial activity at least quarterly (4 times per year) except as provided in paragraphs 5.a.(3) (Sampling Waiver), 5.a.(4) (Representative Discharge), and 5.a.(5) (Alternative Certification). Treatment works are required to monitor their storm water discharges for the pollutants of concern listed in Table T-1 below. Facilities must report in accordance with 5.b. (Reporting). In addition to the parameters listed in Table T-1 below, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall

measurements or estimates (in inches) of the storm event that generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

TABLE T-1.—MONITORING REQUIREMENTS

| Pollutants of concern | Monitoring cut-off concentration (mg/L) |
|-----------------------------------|---|
| Total Phosphorus | 0.33 |
| Nitrate + Nitrite Nitrogen | 0.68 |
| Ammonia | 0.0925 |
| Total Recoverable Copper | 0.009 |
| Total Recoverable Iron | 0.3 |
| Total Recoverable Manganese | 0.05 |
| Total Recoverable Zinc | 0.065 |

(1) **Monitoring Periods.** Treatment works shall monitor samples collected during the sampling periods of: January to March, April to June, July to September, and October to December for the years specified in paragraph a. (above).

(2) **Sample Type.** A minimum of one grab sample shall be taken. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable. If storm water discharges associated with industrial activity commingle with process or nonprocess water, then where practicable permittees must attempt to sample the storm water discharge before it mixes with the non-storm water discharge.

(3) **Sampling Waiver.**

(a) **Adverse Conditions.** When a discharger is unable to collect samples during one of the monitoring periods specified in paragraph b. (Monitoring Periods) because of adverse climatic conditions, the discharger may collect two samples from the two separate qualifying events in the next monitoring period and submit this data. Adverse weather conditions that may prohibit the collection of samples include weather conditions that create

dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(b) **Low Concentration Waiver.** When the average concentration for a pollutant calculated from all monitoring data collected from an outfall during the monitoring period [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] is less than the corresponding value for that pollutant listed in Table T-1 under the column Monitoring Cut-off Concentration, a facility may waive monitoring and reporting requirements in the monitoring period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance]. The facility must submit to the Director, in lieu of the monitoring data, a certification that there has not been a significant change in industrial activity or the pollution prevention measures in area of the facility which drains to the outfall for which sampling was waived.

(4) **Representative Discharge.** When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may test the effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan. The permittee shall include the description of the location of the outfalls, explanation of why outfalls are expected to discharge substantially identical effluents, and estimate of the size of the drainage area and runoff coefficient with the Discharge Monitoring Report.

(5) **Alternative Certification.** A discharger is not subject to the monitoring requirements of this section provided the discharger makes a certification for a given outfall, on an annual basis, under penalty of law,

signed in accordance with Part VII.G. (Signatory Requirements), that material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, industrial machinery or operations, or significant materials from past industrial activity that are located in areas of the facility within the drainage area of the outfall are not presently exposed to storm water and are not expected to be exposed to storm water for the certification period. Such certification must be retained in the storm water pollution prevention plan, and submitted to EPA in accordance with Part VI.A. of this permit.

b. Reporting. Permittees with treatment works shall submit monitoring results for each outfall associated with industrial activity [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the reporting period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March [insert the date 2 years after permit issuance]. Monitoring results (or a certification in accordance with Sections (3), (4), or (5) above) obtained during the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance] shall be submitted on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March. A separate Discharge Monitoring Report Form is required for each quarterly sampling period. Signed copies of Discharge Monitoring Reports, or said certifications, shall be submitted to the Director of the NPDES program at the address of the appropriate Regional Office listed in Part VI.G. of the fact sheet.

(1) Additional Notification. In addition to filing copies of discharge monitoring reports in accordance with paragraph b (above), treatment works with at least one storm water discharge associated with industrial activity through a large or medium municipal separate storm sewer system (systems serving a population of 100,000 or more) must submit signed copies of discharge monitoring reports to the operator of the municipal separate storm sewer system in accordance with the dates provided in paragraph b (above).

c. Monthly Visual Examination of Storm Water Quality. Facilities shall perform and document a visual examination of a representative storm water discharge associated with industrial activity exposed to storm

water. The examination must be made at least once in each month during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(1) Examinations shall be made of samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 1 hour) of when the runoff or snowmelt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The inspection must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Where practicable, the same individual should carry out the collection and examination of discharges for entire permit term.

(2) Visual observation reports must be maintained onsite in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

(3) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the observation data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

When a discharger is unable to collect samples over the course of the monitoring period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

U. Storm Water Discharges Associated With Industrial Activity From Food and Kindred Products Facilities

1. Discharges Covered Under This Section. This section covers all storm water discharges from food and kindred products processing facilities commonly identified by Standard Industrial Classification (SIC) code 20 (including meat products; dairy products; canned, frozen and preserved fruits, vegetables, and food specialties; grain mill products; bakery products; sugar and confectionery products; fats and oils; beverages; and miscellaneous food preparations and kindred products) and SIC Code 21 (tobacco products manufacturing), except for storm water discharges identified under paragraph I.B.3. where industrial plant yards; material handling sites; refuse sites; sites used for application or disposal of process wastewaters; sites used for storage and maintenance of material handling equipment; sites used for residential treatment, storage, or disposal; shipping and receiving areas; manufacturing buildings; and storage areas for raw material and intermediate and finished products are exposed to storm water and areas where industrial activity has taken place in the past and significant materials remain. For the purposes of this paragraph, material handling activities include the storage, loading, and unloading, transportation, or conveyance of any raw material, intermediate product, finished product, by-product, or waste product.

When an industrial facility, described by the above eligibility provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for

industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

If monitoring and pollution prevention plan requirements of another industrial activity section of this permit apply to co-located industrial activities at an industrial facility, the eligibility provisions of that industrial activity section shall not preclude the operator of the industrial facility from complying with the applicable monitoring and pollution prevention plan requirements of that section.

2. Special Conditions

a. Prohibition of Non-storm Water Discharges.

(1) Discharges of non-storm water, including boiler blowdown, cooling tower overflow and blowdown, ammonia refrigeration purging, and vehicle washing/clean-out operations, to waters of the United States, or through municipal separate storm sewer systems, are not authorized by this permit. The operators of such discharges must obtain coverage under a separate NPDES wastewater discharge permit.

3. Storm Water Pollution Prevention Plan Requirements

a. *Contents of Plan.* The plan shall include, at a minimum, the following items:

(1) *Pollution Prevention Team.* Each plan shall identify a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team that are responsible for developing the storm water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

(2) *Description of Potential Pollutant Sources.* Each plan shall provide a description of potential sources which may reasonably be expected to add significant amounts of pollutants to storm water discharges or which may result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. Each plan shall identify all activities and significant materials which may potentially be significant pollutant sources. Each plan shall include, at a minimum:

(a) *Drainage*—A site map indicating the pattern of storm water drainage, existing structural control measures to reduce pollutants in storm water runoff, surface water bodies, locations where significant materials are exposed to precipitation, and locations where major spills or leaks identified under Part XI.U.3.a.(2)(c) (Spills and Leaks) of this permit have occurred since 3 years prior to the effective date of this permit. The map must also indicate the locations of all industrial activities that are exposed to precipitation, including, but not limited to: loading/unloading areas; vehicle fueling; vehicle and equipment maintenance and/or cleaning areas; waste treatment, storage and disposal locations; liquid storage tanks; vents and stacks from cooking, drying, and similar operations, dry product vacuum transfer lines; animal holding pens; spoiled product and broken product container storage areas; significant dust or particulate generating areas; and any other processing and storage areas exposed to storm water. Flows with a significant potential for causing erosion shall also be identified. In addition, the site map must identify monitoring locations.

(b) *Inventory of Exposed Materials*—An inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such inventory shall include a narrative description of significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of 3 years prior to the date of the issuance of this permit and the present; method and location of onsite storage or disposal; materials management practices employed to minimize contact of materials with storm water runoff between the time of 3 years prior to the date of the issuance of this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of any treatment the storm water receives.

(c) *Spills and Leaks*—A list of significant spills and significant leaks of toxic or hazardous pollutants that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility after the date of 3 years prior to the effective date of this permit. Such list shall be updated as appropriate during the term of the permit.

(d) *Sampling Data*—A summary of existing discharge sampling data describing pollutants in storm water discharges from the facility, including a

summary of sampling data collected during the term of this permit.

(e) *Summary of Potential Pollutant Sources*—The description of potential pollutant sources culminates in a narrative assessment of the risk potential that the industrial activities, materials, and physical features of the site, as identified in XI.U.3.a.(2)(a) (drainage), pose to storm water quality. The description shall specifically list any significant potential source of pollutants at the site and for each potential source, any pollutant or pollutant parameter (e.g., biochemical oxygen demand, oil and grease, etc.) of concern shall be identified.

In addition to food and kindred products processing-related industrial activities, the plan must also describe application/storage of pest control chemicals (e.g., rodenticides, insecticides, fungicides, and others) used on plant grounds, including a description of pest control application and chemical storage practices.

(3) *Measures and Controls.* Each facility covered by this permit shall develop a description of storm water management controls appropriate for the facility, and implement such controls. The appropriateness and priorities of controls in a plan shall reflect identified potential sources of pollutants at the facility. The description of storm water management controls shall address the following minimum components, including a schedule for implementing such controls:

(a) *Good Housekeeping*—Good housekeeping requires the maintenance of areas which may contribute pollutants to storm waters discharges in a clean, orderly manner.

(b) *Preventive Maintenance*—A preventive maintenance program shall involve timely inspection and maintenance of storm water management devices (e.g., cleaning oil/water separators, catch basins) as well as inspecting and testing facility equipment and systems to uncover conditions that could cause breakdowns or failures resulting in discharges of pollutants to surface waters, and ensuring appropriate maintenance of such equipment and systems.

(c) *Spill Prevention and Response Procedures*—Areas where potential spills which can contribute pollutants to storm water discharges can occur, and their accompanying drainage points shall be identified clearly in the storm water pollution prevention plan. Areas that must be identified should include loading/unloading stations, outdoor storage areas, and waste management areas exposed to storm water. Where

appropriate, specifying material handling procedures, storage requirements, and use of equipment such as diversion valves in the plan should be considered. Procedures for cleaning up spills shall be identified in the plan and made available to the appropriate personnel. The necessary equipment to implement a clean up should be available to personnel.

(d) *Inspections*—As part of the comprehensive site evaluation required under Part XI.U.3.a.(4) of this section, qualified facility personnel shall be identified to inspect designated equipment and areas of the facility at least once each year. At a minimum, the following areas, where the potential for exposure to storm water exists, must be inspected on a regularly scheduled basis: loading and unloading areas for all significant materials; storage areas, including associated containment areas; waste management units; vents and stacks emanating from industrial activities; spoiled product and broken product container holding areas; animal holding pens; staging areas; and air pollution control equipment. A set of tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections. Records of inspections shall be maintained. Based on the results of the inspection, the description of potential pollutant sources and pollution prevention measures and controls identified in the plan shall be revised as appropriate within 2 weeks of such inspection and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the inspection.

(e) *Employee Training*—Employee training programs shall inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise responsible for storm water management at all levels of responsibility of the components and goals of the storm water pollution prevention plan. Training should address topics such as spill response, good housekeeping, material management practices, unloading/loading practices, outdoor storage areas, waste management practices, pest control, and improper connections to the storm sewer. At a minimum, this training must be provided annually. The pollution prevention plan shall identify frequencies and approximate dates for such training.

(f) *Recordkeeping and Internal Reporting Procedures*—A description of incidents (such as spills, or other discharges), along with other information describing the quality and

quantity of storm water discharges shall be included in the plan required under this part. Inspections and maintenance activities shall be documented and records of such activities shall be incorporated into the plan. Ineffective BMPs must be recorded and the date of their corrective actions noted in the plan.

(g) *Non-storm Water Discharges.*

(i) The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit. Such certification may not be feasible if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit which receives the discharge. In such cases, the source identification section of the storm water pollution plan shall indicate why the certification required by this part was not feasible, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with Part XI.U.3.a.(3)(g)(iv) (Failure to Certify) of this permit.

(ii) Except for flows from fire fighting activities, sources of non-storm water listed in Part III.A. (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

(iii) If the facility discharges wastewater, other than storm water via an existing NPDES permit, a copy of the NPDES permit authorizing the discharge must be attached to the plan. Similarly, if the facility submitted an application for an NPDES permit for non-storm water discharges, but has not yet received that permit, a copy of the permit application must be attached. Upon issuance or reissuance of an NPDES permit, the facility must modify its plan to include a copy of that permit. For facilities that discharge wastewater,

other than solely domestic wastewater, to a Publicly Owned Treatment Works (POTW), the facility must notify the POTW of its discharge. Proof of this notification should be attached to the plan in the form of either: (1) a copy of the permit issued by the treatment plant to the facility, or (2) a copy of a notification letter to the POTW. Notification should identify, in general, the types of wastewater discharged to the POTW, including any storm water discharges. Whether or not the POTW issues a permit to the facility, storm water discharges to the POTW must be considered in the plan.

(iv) *Failure to Certify*—Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director by [Insert date 270 days after permit issuance] or, for facilities which begin to discharge storm water associated with industrial activity after [Insert date 270 days after permit issuance], 180 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: the procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States which are not authorized by an NPDES permit are unlawful and must be terminated.

(h) *Sediment and Erosion Control*—The plan shall identify areas which, due to topography, activities, or other factors, have a high potential for significant soil erosion, and identify structural, vegetative, and/or stabilization measures to be used to limit erosion.

(i) *Management of Runoff*—The plan shall contain a narrative consideration of the appropriateness of traditional storm water management practices (practices other than those which control the generation or source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. The plan shall provide that measures that the permittee determines to be reasonable and appropriate shall be implemented and maintained. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity [see Part XI.U.3.a.(2) (Description of Potential Pollutant Sources) of this

permit] shall be considered when determining reasonable and appropriate measures. Appropriate measures may include: vegetative swales and practices, reuse of collected storm water (such as for a process or as an irrigation source), inlet controls (such as oil/water separators), snow management activities, infiltration devices, and wet detention/retention devices.

(4) *Comprehensive Site Compliance Evaluation.* Qualified personnel shall conduct site compliance evaluations at appropriate intervals specified in the plan, but in no case less than once a year. Where compliance evaluation schedules overlap with inspections required under XI.U.3.a.(3)(d) of this section, the compliance evaluation may be conducted in place of one such inspection. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with industrial activity shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, and other structural pollution prevention measures identified in the plan shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the inspection, the description of potential pollutant sources identified in the plan in accordance with Part XI.U.3.a.(2) (Description of Potential Pollutant Sources) of this permit and pollution prevention measures and controls identified in the plan in accordance with paragraph XI.U.3.a.(3) (Measures and Controls) of this permit shall be revised as appropriate within 2 weeks of such inspection and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the inspection.

(c) A report summarizing the scope of the inspection, personnel making the inspection, the date(s) of the inspection, major observations relating to the implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph XI.U.3.a.(4)(d) (above) of the permit shall be made and retained as part of the storm water pollution prevention plan for at least 1 year after coverage under

this permit terminates. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.C. (Signatory Requirements) of this permit.

(d) The storm water pollution prevention plan must describe the scope and content of the comprehensive site inspections that qualified personnel will conduct to (1) confirm the accuracy of the description of potential sources contained in the plan, (2) determine the effectiveness of the plan, and (3) assess compliance with the terms and conditions of the permit. The individual or individuals who will conduct the inspections must be identified in the plan and should be members of the pollution prevention team, as identified in Part XI.U.3.a.(1) (Pollution Prevention Team). Inspection reports must be retained for at least 3 years after the date that the permit expires.

4. *Numeric Effluent Limitations.*

There are no additional numeric effluent limitations beyond those described in Part V. of this permit.

5. *Monitoring and Reporting Requirements*

a. *Analytical Monitoring Requirements.* During the period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] and the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance], permittees with food and kindred products facilities must monitor their storm water discharges associated with industrial activity at least quarterly (4 times per year) except as provided in paragraphs 5.a.(3) (Sampling Waiver), 5.a.(4) (Representative Discharge), and 5.a.(5) (Alternative Certification). Food and kindred products facilities are required to monitor their storm water discharges for the pollutants of concern listed in Table U-1 below. Facilities must report in accordance with 5.b. (Reporting). In addition to the parameters listed in Table U-1 below, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event that generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of

the total volume (in gallons) of the discharge sampled.

TABLE U-1.—MONITORING REQUIREMENTS

| Pollutants of concern | Cut-off concentration (mg/L) |
|--|------------------------------|
| Five-Day Biochemical Oxygen Demand (BOD ₅) | 9 |
| Ammonia | 0.093 |
| Total Kjeldahl Nitrogen (TKN) | 1.5 |
| Total Phosphorus | 0.33 |
| Total Recoverable Copper | 0.009 |
| Total Recoverable Manganese | 0.05 |
| Total Recoverable Iron | 0.3 |
| Total Recoverable Zinc | 0.065 |

(1) *Monitoring Periods.* Food and kindred products facilities shall monitor samples collected during the sampling periods of: January to March, April to June, July to September, and October to December for the years specified in paragraph a. (above).

(2) *Sample Type.* A minimum of one grab sample shall be taken. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable. If storm water discharges associated with industrial activity commingle with process or non-process water, then where practicable permittees must attempt to sample the storm water discharge before it mixes with the non-storm water discharge.

(3) *Sampling Waiver.*

(a) *Adverse Conditions.*—When a discharger is unable to collect samples during one of the monitoring periods specified in paragraph b. (Monitoring Periods) because of adverse climatic conditions, the discharger may collect two samples from the two separate qualifying events in the next monitoring period and submit this data. Adverse weather conditions that may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms

etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(b) *Low Concentration Waiver*—When the average concentration for a pollutant calculated from all monitoring data collected from an outfall during the monitoring period [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] is less than the corresponding value for that pollutant listed in Table U-1 under the column Monitoring Cut-off Concentration, a facility may waive monitoring and reporting requirements in the monitoring period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance]. The facility must submit to the Director, in lieu of the monitoring data, a certification that there has not been a significant change in industrial activity or the pollution prevention measures in area of the facility which drains to the outfall for which sampling was waived.

(4) *Representative Discharge*. When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may test the effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan. The permittee shall include the description of the location of the outfalls, explanation of why outfalls are expected to discharge substantially identical effluents, and estimate of the size of the drainage area and runoff coefficient with the Discharge Monitoring Report.

(5) *Alternative Certification*. A discharger is not subject to the monitoring requirements of this section provided the discharger makes a certification for a given outfall, on an annual basis, under penalty of law, signed in accordance with part VII.G. (Signatory Requirements), that material handling equipment or activities, raw

materials, intermediate products, final products, waste materials, by-products, industrial machinery or operations, or significant materials from past industrial activity, that are located in areas of the facility within the drainage area of the outfall are not presently exposed to storm water and are not expected to be exposed to storm water for the certification period. Such certification must be retained in the storm water pollution prevention plan, and submitted to EPA in accordance with part VI.C. of this permit.

b. *Reporting*. Permittees with food and kindred products facilities shall submit monitoring results for each outfall associated with industrial activity [or a certification in accordance with sections (3), (4), or (5) above] obtained during the reporting period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March [insert the date 2 years after permit issuance]. Monitoring results (or a certification in accordance with sections (3), (4), or (5) above) obtained during the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance] shall be submitted on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March. A separate Discharge Monitoring Report Form is required for each quarterly sampling period. Signed copies of Discharge Monitoring Reports, or said certifications, shall be submitted to the Director of the NPDES program at the address of the appropriate Regional Office listed in part VI.G. of the fact sheet to this permit.

(1) *Additional Notification*. In addition to filing copies of discharge monitoring reports in accordance with paragraph b (above) food and kindred products, facilities with at least one storm water discharge associated with industrial activity through a large or medium municipal separate storm sewer system (systems serving a population of 100,000 or more) must submit signed copies of discharge monitoring reports to the operator of the municipal separate storm sewer system in accordance with the dates provided in paragraph b (above).

c. *Monthly Visual Examination of Storm Water Quality*. Facilities shall perform and document a visual examination of a representative storm water discharge associated with industrial activity exposed to storm water. The examination must be made at least once in each month during

daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(1) *Examinations* shall be made of a grab sample collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 1 hour) of when the runoff or snowmelt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The inspection must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Where practicable, the same individual should carry out the collection and examination of discharges for entire permit term.

(2) *Visual observation reports* must be maintained onsite in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

(3) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the observation data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

(a) When a discharger is unable to collect samples over the course of the

monitoring period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

V. Storm Water Discharges Associated With Industrial Activity From Textile Mills, Apparel, and Other Fabric Product Manufacturing Facilities

1. Discharges Covered Under This Section. The requirements listed under this section shall apply to storm water discharges from the following activities: Textile Mill Products, of and regarding facilities and establishments engaged in the preparation of fiber and subsequent manufacturing of yarn, thread, braids, twine, and cordage, the manufacturing of broadwoven fabrics, narrow woven fabrics, knit fabrics, and carpets and rugs from yarn; processes involved in the dyeing and finishing of fibers, yarn fabrics, and knit apparel; the integrated manufacturing of knit apparel and other finished articles of yarn; the manufacturing of felt goods (wool), lace goods, nonwoven fabrics, miscellaneous textiles, and other apparel products.

The following standard industrial classification (SIC) codes from the 1987 manual, are typical of the types of industrial activities included for coverage under this section: 2211, broadwoven fabric mills, cotton; 2221, broadwoven fabric Mills, Manmade fibers and silk; 2231, broadwoven fabric mills, wool; 2241, narrow fabric mills; 2251, women's hosiery, except socks; 2252, hosiery; 2257, weft knit fabric mills; 2258, lace and warp knit fabric mills; 2259, knitting mills; 2260, textile finishing, except wool; 2261, finishing plants, cotton; 2262, finishing plant, man-made; 2269, finishing plants; 2273, carpets and rugs; 2281, yarn spinning mills; 2282, throwing and winding mills; 2283, thread mills; 2294, textile goods; 2295, coated fabrics, not rubberized; 2297, nonwoven fabrics; 2299, textile goods; curtains and draperies; and SIC Group 23.

When an industrial facility, described by the above eligibility provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the

other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

If monitoring and pollution prevention plan requirements of another industrial activity section of this permit apply to co-located industrial activities at an industrial facility, the eligibility provisions of that industrial activity section shall not preclude the operator of the industrial facility from complying with the applicable monitoring and pollution prevention plan requirements of that section.

2. Special Conditions

a. Prohibition of Non-storm Water Discharges.

(1) Prohibited non-storm water includes, but is not limited to discharges of wastewater, such as wastewater as a result of wet processing, wastewaters resulting from any processes relating to the production process, reused or recycled water, and waters used in cooling towers. Operators of such discharges to waters of the United States, must obtain coverage under a separate NPDES permit.

3. Storm Water Pollution Prevention Plan Requirements

a. Contents of Plan. The plan shall include, at a minimum, the following items:

(1) **Pollution Prevention Team.** Each plan shall identify a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team who are responsible for developing the storm water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

(2) **Description of Potential Pollutant Sources.** Each plan shall provide a description of potential sources which may reasonably be expected to add significant amounts of pollutants to storm water discharges or which may result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. Each plan

shall identify all activities and significant materials which may potentially be significant pollutant sources. Each plan shall include, at a minimum:

(a) Drainage.

(i) A site map indicating an outline of the portions of the drainage area of each storm water outfall that are within the facility boundaries, each existing structural control measure to reduce pollutants in storm water runoff, surface water bodies, locations where significant materials are exposed to precipitation, locations where major spills or leaks identified under Part XI.V.3.a.(2)(c) (Spills and Leaks) of this permit have occurred, and the locations of the following activities where such activities are exposed to precipitation: loading/unloading areas, locations used for the treatment, storage or disposal of wastes, liquid storage tanks or silos, bulk storage areas that may exist, processing areas and storage areas, fueling stations, vehicle and equipment maintenance and/or cleaning areas.

(ii) For each area of the facility that generates storm water discharges associated with industrial activity with a reasonable potential for containing significant amounts of pollutants, a prediction of the direction of flow, and an identification of the types of pollutants which are likely to be present in storm water discharges associated with industrial activity. Factors to consider include the toxicity of chemical; quantity of chemicals used, produced or discharged; the likelihood of contact with storm water; and history of significant leaks or spills of toxic or hazardous pollutants. Flows with a significant potential for causing erosion shall be identified.

(b) Inventory of Exposed Materials—An inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such inventory shall include a narrative description of significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of 3 years prior to the date of the issuance of this permit and the present; method and location of onsite storage or disposal; materials management practices employed to minimize contact of materials with storm water runoff between the time of 3 years prior to the date of the issuance of this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of any treatment the storm water receives.

(c) *Spills and Leaks*—A list of significant spills and significant leaks of toxic or hazardous pollutants that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility after the date of 3 years prior to the effective date of this permit. Such list shall be updated as appropriate during the term of the permit.

(d) *Sampling Data*—A summary of existing discharge sampling data describing pollutants in storm water discharges from the facility, including a summary of sampling data collected during the term of this permit.

(e) *Risk Identification and Summary of Potential Pollutant Sources*—A narrative description of the potential pollutant sources from the following activities: loading and unloading operations; outdoor storage activities; outdoor manufacturing or processing activities; significant dust or particulate generating processes; onsite waste disposal practices; industry-specific significant materials and industrial activities (e.g., backwinding, beaming, bleaching, backing, bonding carbonizing, carding, cut and sew operations, desizing, drawing, dyeing flocking, fulling, knitting, mercerizing, opening, packing, plying, scouring, slashing, spinning, synthetic-felt processing, textile waste processing, tufting, turning, weaving, web forming, winging, yarn spinning, and yarn texturing). The description shall specifically list any significant potential source of pollutants at the site and for each potential source, any pollutant or pollutant parameter (e.g., biochemical oxygen demand, etc.) of concern shall be identified.

(3) *Measures and Controls*. Each facility covered by this permit shall develop a description of storm water management controls appropriate for the facility, and implement such controls. The appropriateness and priorities of controls in a plan shall reflect identified potential sources of pollutants at the facility. The description of storm water management controls shall address the following minimum components, including a schedule for implementing such controls:

(a) *Good Housekeeping*—Good housekeeping requires the maintenance of areas which may contribute pollutants to storm water discharges in a clean, orderly manner. The following areas must be specifically addressed, when applicable at the facility:

(i) *Material Storage Areas*—All stored and containerized materials (fuels, petroleum products, solvents, dyes, etc.) must be stored in a protected area, away

from drains and clearly labeled. The plan must describe measures that prevent or minimize contamination of storm water runoff from such storage areas. The facility should specify which materials are stored indoors and must provide a description of the containment area or enclosure for those materials which are stored outdoors. Above ground storage tanks, drums, and barrels permanently stored outside must be delineated on the site map with a description of the appropriated containment measures in place to prevent leaks and spills. The facility may consider an inventory control plan to prevent excessive purchasing, storage, and handling of potentially hazardous substances. In the case of storage of empty chemical drums and containers, facilities should employ practices which ensure that barrels are clean and residuals are not subject to contact with storm water, such practices may include triple-rinsing containers. The discharge waters from such washings must be collected and disposed of properly.

(ii) *Material Handling Area*—The plan must describe measures that prevent or minimize contamination of the storm water runoff from materials handling operations and areas. The facility may consider the use of spill and overflow protection; covering fueling areas; covering and enclosing areas where the transfer of materials may occur. Where applicable, the plan must address the replacement or repair of leaking connections, valves, transfer lines and pipes that may carry chemicals, dyes, or wastewater.

(iii) *Fueling Areas*—The plan must describe measures that prevent or minimize contamination of the storm water runoff from fueling areas. The facility may consider covering the fueling area, using spill and overflow protection, minimizing runoff of storm water to the fueling area, using dry cleanup methods, and/or collecting the storm water runoff and providing treatment or recycling.

(iv) *Above Ground Storage Tank Areas*—The plan must describe measures that prevent or minimize contamination of the storm water runoff from above ground storage tank areas. The facility must consider storage tanks and their associated piping and valves. The facility may consider regular cleanup of these areas, preparation of a spill prevention control and countermeasure program, provide spill and overflow protection, minimizing runoff of storm water from adjacent areas, restrict access to the area, insertion of filters in adjacent catch basins, provide absorbent booms in

unbermed fueling areas, use of dry cleanup methods, and permanently sealing drains within critical areas that may discharge to a storm drain.

(b) *Preventive Maintenance*—A preventive maintenance program shall involve timely inspection and maintenance of storm water management devices (e.g., cleaning oil/water separators, sediment traps, catch basins, infiltration devices, ponds) as well as inspecting and testing facility equipment and systems to uncover conditions that could cause breakdowns or failures resulting in discharges of pollutants to surface waters, and ensuring appropriate maintenance of such equipment and systems.

(c) *Spill Prevention and Response Procedures*—Areas where potential spills which can contribute pollutants to storm water discharges can occur, and their accompanying drainage points shall be identified clearly in the storm water pollution prevention plan. Where appropriate, specifying material handling procedures, storage requirements, and use of equipment such as diversion valves in the plan should be considered. Procedures for cleaning up spills shall be identified in the plan and made available to the appropriate personnel. The necessary equipment to implement a clean up should be available to personnel.

(d) *Inspections*—Qualified facility personnel shall be identified to inspect designated equipment and areas of the facility at appropriate intervals specified in the plan. Inspection intervals are to occur on a monthly basis. Inspections of this nature shall include, but not be limited to, the following areas: all containment and storage areas, transfer and transmission lines, spill prevention, good housekeeping practices, management of process waste products, all structural and nonstructural management practices. A set of tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections. Records of inspections shall be maintained.

(e) *Employee Training*—Employee training programs shall inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise responsible for storm water management at all levels of responsibility of the components and goals of the storm water pollution prevention plan. Training should address topics such as spill response, good housekeeping and material management practices. The pollution prevention plan shall identify periodic dates for such training to take place at least semiannually. Employee

training must, at a minimum address the following areas when applicable to a facility: use of reused/recycled waters; solvents management; proper disposal of dyes; proper disposal of petroleum products and spent lubricants; spill prevention and control; fueling procedures; and general good housekeeping practices. Employees, independent contractors, and customers must be informed about BMPs and be required to perform in accordance with these practices. Copies of BMPs and any specific management plans, including emergency phone numbers, shall be posted in the work areas.

(f) *Recordkeeping and Internal Reporting Procedures*—A description of incidents (such as spills, or other discharges), along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. Inspections and maintenance activities shall be documented and records of such activities shall be incorporated into the plan.

(g) *Non-storm Water Discharges*

(i) The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit. Such certification may not be feasible if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit which receives the discharge. In such cases, the source identification section of the storm water pollution plan shall indicate why the certification required by this part was not feasible, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with paragraph XI.V.3.a.(3)(g)(iii) (below).

(ii) Except for flows from fire fighting activities, sources of non-storm water listed in Part III.A.2. of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the

implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

(iii) *Failure to Certify*—Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director by [Insert date 270 days after permit issuance] or, for facilities which begin to discharge storm water associated with industrial activity after [Insert date 270 days after permit issuance], 180 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: the procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States which are not authorized by an NPDES permit are unlawful, and must be terminated.

(h) *Sediment and Erosion Control*—The plan shall identify areas which, due to topography, activities, or other factors, have a high potential for significant soil erosion, and identify structural, vegetative, and/or stabilization measures to be used to limit erosion.

(i) *Management of Runoff*—The plan shall contain a narrative consideration of the appropriateness of traditional storm water management practices (practices other than those which control the generation or source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. The plan shall provide that measures that the permittee determines to be reasonable and appropriate shall be implemented and maintained. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity (see paragraph XI.V.3.a.(2) of this section (Description of Potential Pollutant Sources)) shall be considered when determining reasonable and appropriate measures. Appropriate measures may include: vegetative swales and practices, reuse of collected storm water (such as for a process or as an irrigation source), inlet controls (such as oil/water separators), snow management activities, infiltration devices, and wet detention/retention devices.

(4) *Comprehensive Site Compliance Evaluation*. Qualified personnel shall conduct site compliance evaluations at

appropriate intervals specified in the plan, but in no case less than once a year. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with industrial activity (storage tank areas, waste disposal and storage areas, dumpsters and open containers stored outside, materials storage areas, engine maintenance and repair areas, material handling areas, and loading dock areas) shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, and other structural pollution prevention measures identified in the plan shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the inspection, the description of potential pollutant sources identified in the plan in accordance with paragraph XI.V.3.a.(2) of this section (Description of Potential Pollutant Sources) and pollution prevention measures and controls identified in the plan in accordance with paragraph XI.V.3.a.(3) of this section (Measures and Controls) shall be revised as appropriate within 2 weeks of such inspection and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the inspection.

(c) A report summarizing the scope of the inspection, personnel making the inspection, the date(s) of the inspection, major observations relating to the implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph XI.V.3.a.(4)(b) (above) of the permit shall be made and retained as part of the storm water pollution prevention plan for at least 1 year after coverage under this permit terminates. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) Where compliance evaluation schedules overlap with inspections

required under 3.a.(3)(d), the compliance evaluation may be conducted in place of one such inspection.

4. Numeric Effluent Limitations. There are no additional numeric effluent limitations beyond those described in Part V. of this permit.

5. Monitoring and Reporting Requirements

a. Monitoring Requirements

(1) Quarterly Visual Examination of Storm Water Quality. Facilities shall perform and document a visual examination of a representative storm water discharge associated with industrial activity exposed to storm water. The examination must be made at least once in each designated period [described in (a), below] during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(a) Examinations shall be conducted in each of the following periods for the purposes of visually inspecting storm water quality associated with storm water runoff or snow melt: December to February; March to May; June to August; and September to November.

(b) Examinations shall be made of samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed one hour) of when the runoff or snowmelt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The inspection must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. EPA expects that whenever practicable the same individual will carry out the collection and examination of discharges for the life of the permit.

When a discharger is unable to collect samples over the course of the monitoring period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(c) Visual observation reports must be maintained in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

(d) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the observation data also applies to the substantially identical outfalls provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and an explanation in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

W. Storm Water Discharges Associated With Industrial Activity From Wood and Metal Furniture and Fixture Manufacturing Facilities

1. Discharges Covered Under This Section. The requirements listed under this section shall apply to storm water discharges associated with industrial activities from facilities involved in the manufacturing of:

- Wood Kitchen Cabinets (SIC Code 2434)
- Household Furniture (SIC Code 251)
- Office Furniture (SIC Code 252)
- Public Buildings and Related Furniture (SIC Code 253)
- Partitions, Shelving, Lockers, and Office and Store Fixtures (SIC Code 254)
- Miscellaneous Furniture and Fixtures (SIC Code 259).

When an industrial facility, described by the above eligibility provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution

prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

If monitoring and pollution prevention plan requirements of another industrial activity section of this permit apply to co-located industrial activities at an industrial facility, the eligibility provisions of that industrial activity section shall not preclude the operator of the industrial facility from complying with the applicable monitoring and pollution prevention plan requirements of that section.

2. Special Conditions

a. Prohibition of Non-storm Water Discharges. This section does not cover any discharge subject to process wastewater effluent limitation guidelines, including storm water that combines with process wastewater.

3. Storm Water Pollution Prevention Plan Requirements

a. Contents of Plan. The plan shall include, at a minimum, the following items:

(1) Pollution Prevention Team. Each plan shall identify a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team that are responsible for developing the storm water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

(2) Description of Potential Pollutant Sources. Each plan shall provide a description of potential sources which may reasonably be expected to add significant amounts of pollutants to storm water discharges or which may result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. Each plan shall identify all activities and significant materials which may potentially be significant pollutant sources. Each plan shall include, at a minimum:

(a) Drainage

(i) A site map indicating an outline of the portions of the drainage area of each storm water outfall that are within the facility boundaries, each existing structural control measure to reduce pollutants in storm water runoff, surface water bodies, locations where significant materials are exposed to precipitation, locations where major spills or leaks identified under Part XI.W.3.a.(2)(c) (Spills and Leaks) of this permit have occurred, and the locations of the following activities where such activities are exposed to precipitation: fueling stations; vehicle and equipment maintenance and/or cleaning areas; loading and unloading areas; material storage (including tanks or other vessels used for liquid or waste storage) areas; outdoor material processing areas; areas where wastes are treated, stored, or disposed; access roads; and rail spurs.

(ii) For each area of the facility that generates storm water discharges associated with industrial activity with a reasonable potential for containing significant amounts of pollutants, a prediction of the direction of flow, and an identification of the types of pollutants which are likely to be present in storm water discharges associated with industrial activity. Factors to consider include the toxicity of the chemical; quantity of chemicals used, produced or discharged; the likelihood of contact with storm water; and history of significant leaks or spills of toxic or hazardous pollutants. Flows with a significant potential for causing erosion shall be identified.

(b) *Inventory of Exposed Materials*—An inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such inventory shall include a narrative description of significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of 3 years prior to the date of the issuance of this permit and the present; method and location of onsite storage or disposal; materials management practices employed to minimize contact of materials with storm water runoff between the time of 3 years prior to the date of the issuance of this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of any treatment the storm water receives.

(c) *Spills and Leaks*—A list of significant spills and significant leaks of toxic or hazardous pollutants that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility

after the date of 3 years prior to the effective date of this permit. Such list shall be updated as appropriate during the term of the permit.

(d) *Sampling Data*—A summary of existing discharge sampling data describing pollutants in storm water discharges from the facility, including a summary of sampling data collected during the term of this permit.

(e) *Risk Identification and Summary of Potential Pollutant Sources*—A narrative description of the potential pollutant sources from the following activities: loading and unloading operations; outdoor storage activities; outdoor manufacturing or processing activities; significant dust or particulate generating processes; and onsite waste treatment, storage, or disposal practices. The description shall specifically list any significant potential source of pollutants at the site and for each potential source, any pollutant or pollutant parameter (e.g., biochemical oxygen demand, etc.) of concern shall be identified.

(3) *Measures and Controls*. Each facility covered by this permit shall develop a description of storm water management controls appropriate for the facility, and implement such controls. The appropriateness and priorities of controls in a plan shall reflect identified potential sources of pollutants at the facility. The description of storm water management controls shall address the following minimum components, including a schedule for implementing such controls:

(a) *Good Housekeeping*—Good housekeeping requires the maintenance of areas which may contribute pollutants to storm water discharges in a clean, orderly manner.

(b) *Preventive Maintenance*—A preventive maintenance program shall involve timely inspection and maintenance of storm water management devices (e.g., cleaning oil/water separators, catch basins) as well as inspecting and testing facility equipment and systems to uncover conditions that could cause breakdowns or failures resulting in discharges of pollutants to surface waters, and ensuring appropriate maintenance of such equipment and systems.

(c) *Spill Prevention and Response Procedures*—Areas where potential spills which can contribute pollutants to storm water discharges can occur, and their accompanying drainage points shall be identified clearly in the storm water pollution prevention plan. Where appropriate, specifying material handling procedures, storage requirements, and use of equipment

such as diversion valves in the plan should be considered. Procedures for cleaning up spills shall be identified in the plan and made available to the appropriate personnel. The necessary equipment to implement a clean up should be available to personnel.

(d) *Inspections*—Qualified facility personnel shall be identified to inspect: the integrity of storm water discharge diversions, conveyance systems, sediment control and collection systems, and containment structures; visual inspections of vegetative BMPs to determine if soil erosion has occurred; and visual inspections of material handling and storage areas and other potential sources of pollution for evidence of actual or potential pollutant discharges of contaminated storm water. Visual inspections shall be conducted in each of the following periods: December to February (*storm water runoff or snow melt*); March to May (*storm water runoff*); June to August (*storm water runoff*); September to November (*storm water runoff or snow melt*).

Examinations shall be conducted within the first 30 minutes of when the runoff begins discharging. The visual inspections of BMPs and loading/unloading areas must be made at least once in each designated period during daylight hours unless there is insufficient rainfall or snow-melt to produce a runoff event. Information must be maintained onsite and include the examination date and time and the name of personnel conducting the visual inspection. The pollution prevention plan must be updated based on the results of each inspection. A set of tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections. Records of inspections shall be maintained.

(e) *Employee Training*—Employee training programs shall inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise responsible for storm water management at all levels of responsibility of the components and goals of the storm water pollution prevention plan. Training should address topics such as spill response, good housekeeping and material management practices. A pollution prevention plan shall identify periodic dates for such training.

(f) *Recordkeeping and Internal Reporting Procedures*—A description of incidents (such as spills, or other discharges), BMP inspection and maintenance activities, along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under

this part. Inspections and maintenance activities shall be documented and records of such activities shall be incorporated into the plan. Ineffective BMPs must be reported and the date of their corrective action noted.

(g) Non-storm Water Discharges

(i) The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit. Such certification may not be feasible if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit which receives the discharge. In such cases, the source identification section of the storm water pollution plan shall indicate why the certification required by this part was not feasible, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with paragraph XI.W.3.a.(3)(g)(iii) (below).

(ii) Except for flows from fire fighting activities, sources of non-storm water listed in Part III.A.2. (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

(iii) Failure to Certify—Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director by [Insert date 270 days after permit issuance] or, for facilities which begin to discharge storm water associated with industrial activity after [Insert date 270 days after permit issuance], 180 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: the procedure of any test conducted for the presence of non-storm

water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States which are not authorized by an NPDES permit are unlawful, and must be terminated.

(h) Sediment and Erosion Control—The plan shall identify areas which, due to topography, activities, or other factors, have a high potential for significant soil erosion, and identify structural, vegetative, and/or stabilization measures to be used to limit erosion.

(i) Management of Runoff—The plan shall contain a narrative consideration of the appropriateness of traditional storm water management practices (practices other than those which control the generation or source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. The plan shall provide that measures that the permittee determines to be reasonable and appropriate shall be implemented and maintained. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity [see paragraph XI.W.3.a.(2) of this section (Description of Potential Pollutant Sources)] shall be considered when determining reasonable and appropriate measures. Appropriate measures may include: vegetative swales and practices, reuse of collected storm water (such as for a process or as an irrigation source), inlet controls (such as oil/water separators), snow management activities, infiltration devices, and wet detention/retention devices.

(4) Comprehensive Site Compliance Evaluation. Qualified personnel shall conduct site compliance evaluations at appropriate semiannual intervals. The comprehensive site evaluation must be conducted during the March to May and September to November reporting periods. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with industrial activity including, but not limited to, coal piles, ash disposal areas, loading/unloading operations, and waste treatment, storage, or disposal locations shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether

additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, and other structural pollution prevention measures identified in the plan shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the inspection, the description of potential pollutant sources identified in the plan in accordance with paragraph XI.W.3.a.(2) of this section (Description of Potential Pollutant Sources) and pollution prevention measures and controls identified in the plan in accordance with paragraph XI.W.3.a.(3) of this section (Measures and Controls) shall be revised as appropriate within 2 weeks of such inspection and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the inspection.

(c) A report summarizing the scope of the inspection, personnel making the inspection, the date(s) of the inspection, major observations relating to the implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph XI.W.a.(4)(b) (above) of the permit shall be made and retained as part of the storm water pollution prevention plan for at least 1 year after coverage under this permit terminates. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) Where compliance evaluation schedules overlap with inspections required under XI.W.3.a.(3)(d), the compliance evaluation may be conducted in place of one such inspection.

4. Numeric Effluent Limitations. There are no additional numeric effluent limitations beyond those described in Part V. of this permit.

5. Monitoring and Reporting Requirements

a. Monitoring Requirements.

(1) Quarterly Visual Examination of Storm Water Quality. Facilities shall perform and document a visual examination of a representative storm water discharge associated with industrial activity exposed to storm water. The examination must be made at

least once in each designated period (described in (a), below) during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(a) Examinations shall be conducted in each of the following periods for the purposes of visually inspecting storm water quality associated with storm water runoff or snow melt: December to February; March to May; June to August; and September to November.

(b) Examinations shall be made of samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed one hour) of when the runoff or snowmelt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The inspection must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. EPA expects that whenever practicable the same individual will carry out the collection and examination of discharges for the life of the permit.

When a discharger is unable to collect samples over the course of the monitoring period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricanes, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(c) Visual observation reports must be maintained onsite in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

(d) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall,

the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the observation data also applies to the substantially identical outfalls provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explaining in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g. low (under 40 percent), medium (40 to 65 percent) or high (above 65 percent)] shall be provided in the plan.

When a discharger is unable to collect samples over the course of the monitoring period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

X. Storm Water Discharges Associated With Industrial Activity From Printing and Publishing Facilities

1. *Discharges Covered Under This Section.* The requirements listed under this section shall apply to storm water discharges associated with industrial activity from facilities commonly identified by the following Standard Industrial Classification (SIC) codes:

- Book Printing (SIC Code 2732);
- Commercial Printing, Lithographic (SIC Code 2752);
- Commercial Printing, Gravure (SIC Code 2754);
- Commercial Printing, Not Elsewhere Classified (SIC Code 2759);
- Platemaking and Related Services (SIC Code 2796)

When an industrial facility, described by the above eligibility provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of

this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

If monitoring and pollution prevention plan requirements of another industrial activity section of this permit apply to co-located industrial activities at an industrial facility, the eligibility provisions of that industrial activity section shall not preclude the operator of the industrial facility from complying with the applicable monitoring and pollution prevention plan requirements of that section.

2. *Special Conditions.* There are no additional special conditions beyond those found in Part III. of today's permit.

3. Storm Water Pollution Prevention Plan Requirements

a. *Contents of Plan.* The plan shall include, at a minimum, the following items:

(1) *Pollution Prevention Team.* Each plan shall identify a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team that are responsible for developing the storm water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

(2) *Description of Potential Pollutant Sources.* Each plan shall provide a description of potential sources which may reasonably be expected to add significant amounts of pollutants to storm water discharges or which may result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. Each plan shall identify all activities and significant materials which may potentially be significant pollutant sources. Each plan shall include, at a minimum:

(a) Drainage

(i) A site map indicating an outline of the portions of the drainage area of each storm water outfall that are within the facility boundaries, each existing structural control measure to reduce pollutants in storm water runoff, surface water bodies, locations where significant materials are exposed to precipitation, locations where major spills or leaks identified under Part XI.X.3.a.(2)(c) (Spills and Leaks) of this

section have occurred, and the locations of the following activities where such activities are exposed to precipitation: fueling stations, vehicle and equipment maintenance and/or cleaning areas, loading/unloading areas, locations used for the treatment, storage or disposal of wastes, liquid storage tanks, processing areas and storage areas. Above ground storage tanks, drums, and barrels permanently stored outside must be delineated on the site map.

(ii) For each area of the facility that generates storm water discharges associated with industrial activity with a reasonable potential for containing significant amounts of pollutants, a prediction of the direction of flow, and an identification of the types of pollutants which are likely to be present in storm water discharges associated with industrial activity. Factors to consider include the toxicity of the chemical; quantity of chemicals used, produced or discharged; the likelihood of contact with storm water; and history of significant leaks or spills of toxic or hazardous pollutants. Flows with a significant potential for causing erosion shall be identified.

(b) *Inventory of Exposed Materials*—An inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such inventory shall include a narrative description of significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of 3 years prior to the date of the issuance of this permit and the present; method and location of onsite storage or disposal; materials management practices employed to minimize contact of materials with storm water runoff between the time of 3 years prior to the date of the issuance of this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of any treatment the storm water receives.

(c) *Spills and Leaks*—A list of significant spills and significant leaks of toxic or hazardous pollutants that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility after the date of 3 years prior to the effective date of this permit. Such list shall be updated as appropriate during the term of the permit.

(d) *Sampling Data*—A summary of existing discharge sampling data describing pollutants in storm water discharges from the facility, including a summary of sampling data collected during the term of this permit.

(e) *Risk Identification and Summary of Potential Pollutant Sources*—A narrative description of the potential pollutant sources from the following activities associated with printing, publishing and allied facilities: loading and unloading operations; outdoor storage activities; significant dust or particulate generating processes; and onsite waste disposal practices (i.e., blanket wash). The description shall specifically list any significant potential source of pollutants at the site and for each potential source, any pollutant or pollutant parameter (e.g., oil and grease, scrap metal, etc.) of concern shall be identified.

(3) *Measures and Controls*. Each facility covered by this permit shall develop a description of storm water management controls appropriate for the facility, and implement such controls. The appropriateness and priorities of controls in a plan shall reflect identified potential sources of pollutants at the facility. The description of storm water management controls shall address the following minimum components, including a schedule for implementing such controls:

(a) *Good Housekeeping*—Good housekeeping requires the maintenance of areas which may contribute pollutants to storm water discharges in a clean, orderly manner. Areas where good housekeeping should be implemented include:

(i) *Material Storage Areas*—All stored and containerized materials (skids, pallets, solvents, bulk inks, and hazardous waste, empty drums, portable/mobile containers of plant debris, wood crates, steel racks, fuel oil, etc.) should be stored in a protected area, away from drains and properly labeled. The plan should describe measures that prevent or minimize contamination of the storm water runoff from such storage areas. The facility should specify which materials are stored indoors and must provide a description of the containment area or enclosure for those materials which are stored outdoors. The facility may consider an inventory control plan to prevent excessive purchasing, storage, and handling of potentially hazardous substances. The facility may consider indoor storage of the materials and/or installation of berming and diking of the area.

(ii) *Material Handling Areas*—The plan must describe measures that prevent or minimize contamination of the storm water runoff from materials handling operations and areas (i.e., blanket wash, mixing solvents, loading/unloading materials). The facility may

consider the use of spill and overflow protection; covering fuel areas; covering and enclosing areas where the transfer of materials may occur. Where applicable, the plan must address the replacement or repair of leaking connections, valves, transfer lines and pipes that may carry chemicals, or wastewater.

(iii) *Fueling Areas*—The plan must describe measures that prevent or minimize contamination of the storm water runoff from fueling areas. The facility may consider covering the fueling area, using spill and overflow protection, minimizing runoff of storm water to the fueling area, using dry cleanup methods, and/or collecting the storm water runoff and providing treatment or recycling.

(iv) *Above Ground Storage Tank Areas*—The plan must describe measures that prevent or minimize contamination of the storm water runoff from above ground storage tanks and their associated piping and valves. The facility may consider regular cleanup of these areas, preparation of a spill prevention control and countermeasure program, provide spill and overflow protection, minimizing runoff of storm water from adjacent facilities and properties, restrict access to the area, insertion of filters in adjacent catch basins, provide absorbent booms in unbermed fueling areas, use of dry cleanup methods, and permanently sealing drains within critical areas that may discharge to a storm drain.

(b) *Preventive Maintenance*—A preventive maintenance program shall involve timely inspection and maintenance of storm water management devices (e.g., cleaning oil/water separators, vegetative swales, secondary containment, catch basins) as well as inspecting and testing facility equipment and systems to uncover conditions that could cause breakdowns or failures resulting in discharges of pollutants to surface waters, and ensuring appropriate maintenance of such equipment and systems.

(c) *Spill Prevention and Response Procedures*—Areas where potential spills which can contribute pollutants to storm water discharges can occur, and their accompanying drainage points shall be identified clearly in the storm water pollution prevention plan. Where appropriate, specifying material handling procedures, storage requirements, and use of equipment such as diversion valves in the plan should be considered. Procedures for cleaning up spills shall be identified in the plan and made available to the appropriate personnel. The necessary

equipment to implement a clean up should be available to personnel.

(d) *Inspections*—Qualified facility personnel shall be identified to inspect designated equipment and areas of the facility on an annual basis. The following areas shall be included in, but not limited to, all inspections: all containment and material storage areas, fueling areas, loading and unloading areas, equipment cleaning areas. A set of tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections. Records of inspections shall be maintained.

(e) *Employee Training*—Employee training programs shall inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise responsible for storm water management at all levels of responsibility of the components and goals of the storm water pollution prevention plan. The pollution prevention plan shall identify how often training will take place, but in all cases, training should be provided annually. Employee training must, at a minimum, address the following areas when applicable to a facility: spent solvent management; spill prevention and control; used oil management; fueling procedures; and general good housekeeping practices. The pollution prevention plan shall identify periodic dates for such training.

(f) *Recordkeeping and Internal Reporting Procedures*—A description of incidents (such as spills, or other discharges), along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. Inspections and maintenance activities shall be documented and records of such activities shall be incorporated into the plan.

(g) *Non-storm Water Discharges*

(i) The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit. Such certification may not be feasible if the facility operating the storm water discharge associated with industrial activity does not have access

to an outfall, manhole, or other point of access to the ultimate conduit which receives the discharge. In such cases, the source identification section of the storm water pollution plan shall indicate why the certification required by this part was not feasible, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with paragraph XI.X.3.a.(3)(g)(iii) (below).

(ii) Except for flows from fire fighting activities, sources of non-storm water listed in Part III.A. (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

(iii) *Failure to Certify*—Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director by [Insert date 270 days after permit issuance] or, for facilities which begin to discharge storm water associated with industrial activity after [Insert date 270 days after permit issuance], 180 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: the procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States which are not authorized by an NPDES permit are unlawful, and must be terminated.

(h) *Sediment and Erosion Control*—The plan shall identify areas which, due to topography, activities, or other factors, have a high potential for significant soil erosion, and identify structural, vegetative, and/or stabilization measures to be used to limit erosion.

(i) *Management of Runoff*—The plan shall contain a narrative consideration of the appropriateness of traditional storm water management practices (practices other than those which control the generation or source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. The plan shall provide

that measures that the permittee determines to be reasonable and appropriate shall be implemented and maintained. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity [see paragraph XI.X.3.a.(2) of this section (Description of Potential Pollutant Sources)] shall be considered when determining reasonable and appropriate measures. Appropriate measures may include: vegetative swales and practices, reuse of collected storm water (such as for a process or as an irrigation source), inlet controls (such as oil/water separators), snow management activities, infiltration devices, and wet detention/retention devices.

(4) *Comprehensive Site Compliance Evaluation*. Qualified personnel shall conduct site compliance evaluations at appropriate intervals specified in the plan, but in no case less than once a year. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with industrial activity (including, but not limited to, material handling areas, material storage areas, waste disposal and storage areas, loading/unloading areas) shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, and other structural pollution prevention measures identified in the plan shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the inspection, the description of potential pollutant sources identified in the plan in accordance with paragraph XI.X.3.a.(2) of this section (Description of Potential Pollutant Sources) and pollution prevention measures and controls identified in the plan in accordance with paragraph XI.X.3.a.(3) of this section (Measures and Controls) shall be revised as appropriate within 2 weeks of such inspection and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the inspection.

(c) A report summarizing the scope of the inspection, personnel making the inspection, the date(s) of the inspection, major observations relating to the

implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph XI.X.3.a.(4)(b) (above) of the permit shall be made and retained as part of the storm water pollution prevention plan for at least 1 year after coverage under this permit terminates. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) Where compliance evaluation schedules overlap with inspections required under 3.a.(3)(d), the compliance evaluation may be conducted in place of one such inspection.

4. Numeric Effluent Limitations. There are no additional numeric effluent limitations beyond those described in Part V. of this permit.

5. Monitoring and Reporting Requirements

a. Monitoring Requirements

(1) **Quarterly Visual Examination of Storm Water Quality.** Facilities shall perform and document a visual examination of a representative storm water discharge associated with industrial activity exposed to storm water. The examination must be made at least once in each designated period [described in (a), below] during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(a) Examinations shall be conducted in each of the following periods for the purposes of visually inspecting storm water quality associated with storm water runoff or snow melt: December to February; March to May; June to August; and September to November.

(b) Examinations shall be made of a grab sample collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed one hour) of when the runoff or snowmelt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The inspection must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable

(greater than 0.1 inch rainfall) storm event. EPA expects that whenever practicable the same individual will carry out the collection and examination of discharges for the life of the permit.

When a discharger is unable to collect samples over the course of the monitoring period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(c) Visual observation reports must be maintained in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

(d) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the observation data also applies to the substantially identical outfalls provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explaining in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

Y. Storm Water Discharges Associated With Industrial Activity From Rubber, Miscellaneous Plastic Products, and Miscellaneous Manufacturing Industries

1. Discharges Covered Under This Section. The requirements listed under this section shall apply to all storm water discharges associated with industrial activity from facilities in

major SIC groups 30 and 39 (except SIC 391 Jewelry, Silverware, and Plated Ware). Major group 30 includes rubber and miscellaneous plastic products manufacturing facilities. Major group 39 includes miscellaneous manufacturing industries. This section does not apply to storm water discharges from co-located facilities, such as vehicle maintenance areas which are addressed in a separate section of this permit.

When an industrial facility, described by the above eligibility provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

If monitoring and pollution prevention plan requirements of another industrial activity section of this permit apply to co-located industrial activities at an industrial facility, the eligibility provisions of that industrial activity section shall not preclude the operator of the industrial facility from complying with the applicable monitoring and pollution prevention plan requirements of that section.

2. Special Conditions

a. Prohibition of Non-storm Water Discharges. Other than as provided in Part III.A. of this permit, non-storm water discharges are not authorized by this section.

3. Storm Water Pollution Prevention Plan Requirements

a. Contents of Plan. The plan shall include, at a minimum, the following items:

(1) **Pollution Prevention Team.** Each plan shall identify a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team that are responsible for developing the storm water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall

address all aspects of the facility's storm water pollution prevention plan.

(2) *Description of Potential Pollutant Sources.* Each plan shall provide a description of potential sources which may reasonably be expected to add significant amounts of pollutants to storm water discharges or which may result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. Each plan shall identify all activities and significant materials which may potentially be significant pollutant sources. All rubber manufacturers shall in particular review the use of zinc at their facilities and the possible pathways through which zinc may be discharged in storm water runoff. Each plan shall include, at a minimum:

(a) *Drainage*

(i) A site map indicating an outline of the portions of the drainage area of each storm water outfall that are within the facility boundaries, each existing structural control measure to reduce pollutants in storm water runoff, surface water bodies, locations where significant materials are exposed to precipitation, locations where major spills or leaks identified under Part XI.Y.3.a.(2)(c) (Spills and Leaks) of this permit have occurred, and the locations of the following activities where such activities are exposed to precipitation: fueling stations, vehicle and equipment maintenance and/or cleaning areas, loading/unloading areas, locations used for the treatment, storage or disposal of wastes, liquid storage tanks, processing areas and storage areas.

(ii) For each area of the facility that generates storm water discharges associated with industrial activity with a reasonable potential for containing significant amounts of pollutants, a prediction of the direction of flow, and an identification of the types of pollutants which are likely to be present in storm water discharges associated with industrial activity. Factors to consider include the toxicity of a chemical; quantity of chemicals used, produced or discharged; the likelihood of contact with storm water; and history of significant leaks or spills of toxic or hazardous pollutants. Flows with a significant potential for causing erosion shall be identified.

(b) *Inventory of Exposed Materials—*

An inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such inventory shall include a narrative description of significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of 3 years prior to the date of the issuance

of this permit and the present; method and location of onsite storage or disposal; materials management practices employed to minimize contact of materials with storm water runoff between the time of 3 years prior to the date of the issuance of this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of any treatment the storm water receives.

(c) *Spills and Leaks—*A list of significant spills and significant leaks of toxic or hazardous pollutants that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility after the date of 3 years prior to the effective date of this permit. Such list shall be updated as appropriate during the term of the permit.

(d) *Sampling Data—*A summary of existing discharge sampling data describing pollutants in storm water discharges from the facility, including a summary of sampling data collected during the term of this permit.

(e) *Risk Identification and Summary of Potential Pollutant Sources—*A narrative description of the potential pollutant sources from the following activities: loading and unloading operations; outdoor storage activities; outdoor manufacturing or processing activities; significant dust or particulate generating processes; and onsite waste disposal practices. The description shall specifically list any significant potential source of pollutants at the site and for each potential source, any pollutant or pollutant parameter (e.g., biochemical oxygen demand, etc.) of concern shall be identified.

(3) *Measures and Controls.* Each facility covered by this permit shall develop a description of storm water management controls appropriate for the facility, and implement such controls. The appropriateness and priorities of controls in a plan shall reflect identified potential sources of pollutants at the facility. Facilities subject to EPCRA Section 313 should note that the special requirements of Part IV.E. of this permit also apply to their facilities. The description of storm water management controls shall address the following minimum components, including a schedule for implementing such controls:

(a) *Good Housekeeping—*Good housekeeping requires the maintenance of areas which may contribute pollutants to storm water discharges in a clean, orderly manner.

(b) *Preventive Maintenance—*A preventive maintenance program shall

involve timely inspection and maintenance of storm water management devices (e.g., cleaning oil/water separators, catch basins) as well as inspecting and testing facility equipment and systems to uncover conditions that could cause breakdowns or failures resulting in discharges of pollutants to surface waters, and ensuring appropriate maintenance of such equipment and systems.

(c) *Spill Prevention and Response Procedures—*Areas where potential spills which can contribute pollutants to storm water discharges can occur, and their accompanying drainage points shall be identified clearly in the storm water pollution prevention plan. Where appropriate, specifying material handling procedures, storage requirements, and use of equipment such as diversion valves in the plan should be considered. Procedures for cleaning up spills shall be identified in the plan and made available to the appropriate personnel. The necessary equipment to implement a clean up should be available to personnel.

(d) *Inspections—*In addition to or as part of the comprehensive site evaluation required under paragraph XI.Y.3.a.(4) of this section, qualified facility personnel shall be identified to inspect designated equipment and areas of the facility at appropriate intervals specified in the plan. A set of tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections. Records of inspections shall be maintained.

(e) *Employee Training—*Employee training programs shall inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise responsible for storm water management at all levels of responsibility of the components and goals of the storm water pollution prevention plan. Training should address topics such as spill response, good housekeeping and material management practices. A pollution prevention plan shall identify periodic dates for such training.

(f) *Recordkeeping and Internal Reporting Procedures—*A description of incidents (such as spills, or other discharges), along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. Inspections and maintenance activities shall be documented and records of such activities shall be incorporated into the plan.

(g) *Non-storm Water Discharges*

(i) The plan shall include a certification that the discharge has been

tested or evaluated for the presence of non-storm water discharges. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit. Such certification may not be feasible if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit which receives the discharge. In such cases, the source identification section of the storm water pollution plan shall indicate why the certification required by this part was not feasible, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with paragraph XI.Y.3.a.(3)(g)(iii) (below).

(II) Except for flows from fire fighting activities, sources of non-storm water listed in Part III.A. (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

(iii) *Failure to Certify*—Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director by [Insert date 270 days after permit issuance] or, for facilities which begin to discharge storm water associated with industrial activity after [Insert date 270 days after permit issuance], 180 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: the procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States which are not authorized by an NPDES permit are unlawful, and must be terminated.

(h) *Sediment and Erosion Control*—The plan shall identify areas which, due to topography, activities, or other factors, have a high potential for significant soil erosion, and identify structural, vegetative, and/or stabilization measures to be used to limit erosion.

(i) *Management of Runoff*—The plan shall contain a narrative consideration of the appropriateness of traditional storm water management practices (practices other than those which control the generation or source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. The plan shall provide that measures that the permittee determines to be reasonable and appropriate shall be implemented and maintained. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity [see paragraph XI.Y.3.a.(2) of this section (Description of Potential Pollutant Sources)] shall be considered when determining reasonable and appropriate measures. Appropriate measures may include: vegetative swales and practices, reuse of collected storm water (such as for a process or as an irrigation source), inlet controls (such as oil/water separators), snow management activities, infiltration devices, and wet detention/retention devices.

(i) *Special Requirements for All Rubber Manufacturers*—All rubber manufacturing facilities shall include specific measures and controls to minimize the discharge of zinc in their storm water discharges. The following possible sources of zinc shall be reviewed and the accompanying BMPs shall be included as appropriate in the storm water pollution prevention plan:

(i) *Inadequate Housekeeping*—All permittees shall review the handling and storage of zinc bags at their facilities and consider the following BMPs for the pollution prevention plan: employee training regarding the handling and storage of zinc bags, indoor storage of zinc bags, thorough cleanup of zinc spills without washing the zinc into the storm drain, and the use of 2,500-pound sacks of zinc rather than 50- to 100-pound sacks.

(ii) *Zinc in Dumpsters*—The following BMPs shall be considered to reduce discharges of zinc from dumpsters: providing a cover for the dumpster; move the dumpster to an indoors location; or provide a lining for the dumpster.

(iii) *Malfunctioning Dust Collectors or Baghouses*—Permittees shall review

dust collectors and baghouses as possible sources in zinc in storm water runoff. Improperly operating dust collectors or baghouses shall be replaced or repaired as appropriate. The pollution prevention plan shall also provide for regular maintenance of these facilities.

(iv) *Grinding Operations*—Permittees shall review dust generation from rubber grinding operations at their facility and, as appropriate, install a dust collection system.

(v) *Zinc Stearate Coating Operations*—Permittees shall include in the pollution prevention plan appropriate measures to prevent and/or clean up drips or spills of zinc stearate slurry which may be released to the storm drain. Alternate compounds to zinc stearate shall also be considered.

(4) *Comprehensive Site Compliance Evaluation*. Qualified personnel shall conduct site compliance evaluations at appropriate intervals specified in the plan, but in no case less than once a year. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with industrial activity shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, and other structural pollution prevention measures identified in the plan shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the inspection, the description of potential pollutant sources identified in the plan in accordance with paragraph XI.Y.3.a.(2) of this section (Description of Potential Pollutant Sources) and pollution prevention measures and controls identified in the plan in accordance with paragraph XI.Y.3.a.(3) of this section (Measures and Controls) shall be revised as appropriate within 2 weeks of such inspection and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the inspection.

(c) A report summarizing the scope of the inspection, personnel making the inspection, the date(s) of the inspection, major observations relating to the implementation of the storm water

pollution prevention plan, and actions taken in accordance with paragraph XI.Y.3.a.(4)(b) (above) of the permit shall be made and retained as part of the storm water pollution prevention plan for at least 1 year after coverage under this permit terminates. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) Where compliance evaluation schedules overlap with inspections required under 3.a.(3)(d), the compliance evaluation may be conducted in place of one such inspection.

4. Numeric Effluent Limitations. There are no additional numeric effluent limitations beyond those described in Part V. of this permit.

5. Monitoring and Reporting Requirements

a. Monitoring Requirements

(1) Quarterly Visual Examination of Storm Water Quality. Facilities shall perform and document a visual examination of a representative storm water discharge associated with industrial activity exposed to storm water. The examination must be made at least once in each designated period [described in (a), below] during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(a) Examinations shall be conducted in each of the following periods for the purposes of visually inspecting storm water quality associated with storm water runoff or snow melt: December to February; March to May; June to August; and September to November.

(b) Examinations shall be made of samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed one hour) of when the runoff or snowmelt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The inspection must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm

event. EPA expects that whenever practicable the same individual will carry out the collection and examination of discharges for the life of the permit.

(c) Visual observation reports must be maintained onsite in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

(d) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the observation data also applies to the substantially identical outfalls provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explaining in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

(e) When a discharger is unable to collect samples over the course of the monitoring period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

Z. Storm Water Discharges Associated With Industrial Activity From Leather Tanning and Finishing Facilities

1. Discharges Covered Under This Section. The requirements listed under this section shall apply to storm water discharges from the following activities: leather tanning, currying and finishing, facilities commonly identified by

Standard Industrial Classification (SIC) code 3111. Discharges from facilities which make fertilizer solely from leather scraps and leather dust are also covered under this section. When an industrial facility, described by the above eligibility provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

If monitoring and pollution prevention plan requirements of another industrial activity section of this permit apply to co-located industrial activities at an industrial facility, the eligibility provisions of that industrial activity section shall not preclude the operator of the industrial facility from complying with the applicable monitoring and pollution prevention plan requirements of that section.

2. Special Conditions

There are no special conditions for this section beyond those in Part III. of this permit.

3. Storm Water Pollution Prevention Plan Requirements

a. Contents of Plan. The plan shall include, at a minimum, the following items:

(1) Pollution Prevention Team. Each plan shall identify a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team that are responsible for developing the storm water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

(2) Description of Potential Pollutant Sources. Each plan shall provide a description of potential sources which may reasonably be expected to add significant amounts of pollutants to storm water discharges or which may

result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. Each plan shall identify all activities and significant materials which may potentially be significant pollutant sources or, during periods of dry weather, result in dry weather flows. Each plan shall include, at a minimum:

(a) Drainage

(i) A site map indicating an outline of the portions of the drainage area of each storm water outfall that are within the facility boundaries, each existing structural control measure to reduce pollutants in storm water runoff, surface water bodies (including wetlands), locations where significant materials are exposed to precipitation, locations where major spills or leaks identified under Part XLZ.3.a.(2)(c) (Spills and Leaks) of this permit have occurred, and the locations of the following activities where such activities are exposed to precipitation: fueling stations, vehicle and equipment maintenance and/or cleaning areas, loading/unloading areas, locations used for the treatment, storage or disposal of wastes, material storage (including tanks or other vessels used for liquid or waste storage), processing and storage areas for activities associated with beamhouse, tanyard, retan-wet finishing and dry finishing operations, and haul roads, access roads and rail spurs. The site map must also identify monitoring locations.

(ii) For each area of the facility that generates storm water discharges associated with industrial activity with a reasonable potential for containing significant amounts of pollutants, a prediction of the direction of flow, and an identification of the types of pollutants which are likely to be present in storm water discharges associated with industrial activity. Factors to consider include the toxicity of a chemical; quantity of chemicals used, produced or discharged; the likelihood of contact with storm water; and history of significant leaks or spills of toxic or hazardous pollutants. Flows with a significant potential for causing erosion shall be identified.

*(b) Inventory of Exposed Materials—*An inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such inventory shall include a narrative description of significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of 3 years prior to the date of the issuance of this permit and the present; method and location of onsite storage or disposal; materials management practices employed to minimize contact

of materials with storm water runoff between the time of 3 years prior to the date of the issuance of this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of any treatment the storm water receives. The description must be updated whenever there is a significant change in the types or amounts of materials, or material management practices, that may affect the exposure of materials to storm water.

*(c) Spills and Leaks—*A list of significant spills and significant leaks of toxic or hazardous pollutants that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility after the date of 3 years prior to the effective date of this permit. Significant spills include but are not limited to, releases of oil or hazardous substances in excess of quantities that are reportable under Section 311 of the Clean Water Act (CWA) (see 40 CFR 110.10 and 40 CFR 117.21) or Section 102 of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) (see 40 CFR 302.4). Significant spills may also include releases of oil or hazardous substances that are not in excess of reporting requirements and releases of materials that are not classified as oil or a hazardous substance. Such list shall be updated as appropriate during the term of the permit.

*(d) Sampling Data—*A summary of existing discharge sampling data describing pollutants in storm water discharges from the facility, including a summary of sampling data collected during the term of this permit.

*(e) Risk Identification and Summary of Potential Pollutant Sources—*A narrative description of potential pollutant sources including but not limited to the following activities: loading and unloading operations; outdoor storage activities, including but not limited to: temporary or permanent storage of fresh and brine cured hides, chemical drums, bags, containers and above ground tanks, leather dust, scraps, trimmings and shavings, spent solvents, extraneous hide substances and hair, and empty chemical containers and bags; floor sweepings and washings; refuse and waste piles and sludge; outdoor manufacturing or processing activities; significant dust or particulate generating processes including buffing; vehicle maintenance, washing and fueling and onsite waste disposal practices. The description shall specifically list any significant potential

source of pollutants at the site and for each potential source, any pollutant or pollutant parameter (e.g., biochemical oxygen demand, total suspended solids, chromium, etc.) of concern shall be identified.

(3) Measures and Controls. Each facility covered by this permit shall develop a description of storm water management controls appropriate for the facility, and implement such controls. The appropriateness and priorities of controls in a plan shall reflect identified potential sources of pollutants at the facility. The description of storm water management controls shall address the following minimum components, including a schedule for implementing such controls:

*(a) Good Housekeeping—*Good housekeeping requires the maintenance of areas which may contribute pollutants to storm water discharges in a clean, orderly manner. The following areas must be specifically addressed:

*(i) Storage Areas for Raw, Semiprocessed, or Finished Tannery By-products—*Pallets and/or bales of raw, semiprocessed or finished tannery by-products (e.g., splits, trimmings, shavings, etc.) should be stored indoors or protected by polyethylene wrapping, tarpaulins, roofed storage area or other suitable means. Materials should be placed on an impermeable surface, the area should be enclosed or bermed or other equivalent measures should be employed to prevent runoff and runoff of storm water.

*(ii) Material Storage Areas—*Label storage units of all materials (e.g., specific chemicals, hazardous materials, spent solvents, waste materials). Maintain such containers and units in good condition. Describe measures that prevent or minimize contact with storm water. The facility must consider indoor storage, installation of berming and diking around the area, and/or other equivalent measures to prevent runoff and runoff of storm water.

*Buffing/Shaving Areas—*The plan must describe measures that prevent or minimize contamination of the storm water runoff with leather dust from buffing/shaving areas. The facility may consider dust collection enclosures, preventive inspection/maintenance programs or other appropriate preventive measures.

*(iv) Receiving, Unloading, and Storage Areas—*The plan must describe measures that prevent or minimize contamination of the storm water runoff from receiving, unloading, and storage areas. Exposed receiving, unloading and storage areas for hides and chemical supplies should be protected by a

suitable cover, diversion of drainage to the process sewer, grade berming or curbing area to prevent runoff of storm water or other appropriate preventive measures. Materials must be plainly labelled and maintained in good condition.

(v) *Outdoor Storage of Contaminated Equipment*—The plan must describe measures that minimize contact of storm water with contaminated equipment. Equipment should be protected by suitable cover, diversion of drainage to the process sewer, thorough cleaning prior to storage or other appropriate preventive measures.

(vi) *Waste Management*—The plan must describe measures that prevent contamination of the storm water runoff from waste storage areas. The facility may consider inspection/maintenance programs for leaking containers or spills, covering dumpsters, moving waste management activities indoors, covering waste piles with temporary covering material such as tarpaulins or polyethylene, and minimizing storm water runoff by enclosing the area or building berms around the area.

(b) *Preventive Maintenance*—A preventive maintenance program shall involve timely inspection and maintenance of storm water management devices (e.g., cleaning oil/water separators, catch basins) as well as inspecting and testing facility equipment and systems to uncover conditions that could cause breakdowns or failures resulting in discharges of pollutants to surface waters, and ensuring appropriate maintenance of such equipment and systems.

(c) *Spill Prevention and Response Procedures*—Areas where potential spills which can contribute pollutants to storm water discharges can occur, and their accompanying drainage points shall be identified clearly in the storm water pollution prevention plan. Where appropriate, specifying material handling procedures, storage requirements, and use of equipment such as diversion valves in the plan should be considered. Procedures for cleaning up spills shall be identified in the plan and made available to the appropriate personnel. The necessary equipment to implement a clean up should be available to personnel.

(d) *Inspections*—Qualified facility personnel shall be identified to inspect designated equipment and areas of the facility at least on a quarterly basis. The following areas shall be included in all inspections: leather processing areas, storage areas for chemicals, including but not limited to above ground tanks, fueling areas, vehicle and equipment maintenance areas, material storage

areas, loading and unloading areas, waste management areas and other potential sources of pollution for evidence of actual or potential discharges of contaminated storm water. A set of tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections and that the pollution prevention plan is appropriately modified. Records of inspections shall be maintained as part of the pollution prevention plan.

Qualified personnel are required to conduct quarterly visual inspections of all Best Management Practices (BMPs). The inspections shall include an assessment of the effectiveness and need for maintenance of storm water roofing and covers, dikes and curbs, discharge diversions, sediment control and collection systems and all other BMPs.

Quarterly visual inspections must be made at least once in each of the following designated periods during daylight hours. December to February (storm water runoff or snow melt), March to May (storm water runoff), June to August (storm water runoff), and September to November (snow melt runoff). Records shall be maintained as part of the pollution prevention plan.

(e) *Employee Training*—Employee training programs shall inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise responsible for storm water management at all levels of responsibility of the components and goals of the storm water pollution prevention plan. The pollution prevention plan shall identify how often training will take place, but in all cases, training must be held at least annually. Employee training must, at a minimum, address the following areas when applicable to a facility: general good housekeeping practices, spill prevention and control, waste management, inspections, preventive maintenance, detection of non-storm water discharges and other areas.

(f) *Recordkeeping and Internal Reporting Procedures*—A description of incidents (such as leaks, spills, or other discharges), along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. Inspections and maintenance activities shall be documented and records of such activities shall be incorporated into the plan. The plan must address spills, monitoring, and BMP inspection and maintenance activities. BMPs which were ineffective must be reported and the date of their corrective action recorded. Employees must report incidents of leaking fluids

to facility management and these reports must be incorporated into the plan.

(g) *Non-storm Water Discharges*

(i) The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit. Such certification may not be feasible if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit which receives the discharge. In such cases, the source identification section of the storm water pollution plan shall indicate why the certification required by this part was not feasible, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with paragraph XI.Z.3.a.(3)(g)(iii) (below).

(ii) Except for flows from fire fighting activities, sources of non-storm water listed in Part III.A. (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

(iii) *Failure to Certify*—Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director by [Insert date 270 days after permit issuance] or, for facilities which begin to discharge storm water associated with industrial activity after [Insert date 270 days after permit issuance], 180 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: the procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate tests for such storm sewers were not

feasible. Non-storm water discharges to waters of the United States which are not authorized by an NPDES permit are unlawful, and must be terminated.

(h) Sediment and Erosion Control—The plan shall identify areas which, due to topography, activities, or other factors, have a high potential for significant soil erosion, and identify structural, vegetative, and/or stabilization measures to be used to limit erosion.

(i) Management of Runoff—The plan shall contain a narrative consideration of the appropriateness of traditional storm water management practices (practices other than those which control the generation or source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. The plan shall provide that measures that the permittee determines to be reasonable and appropriate shall be implemented and maintained. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity (see paragraph XI.Z.3.a.(2) of this section (Description of Potential Pollutant Sources)) shall be considered when determining reasonable and appropriate measures. Appropriate measures may include: vegetative swales and practices, reuse of collected storm water (such as for a process or as an irrigation source), inlet controls (such as oil/water separators), snow management activities, infiltration devices, and wet detention/retention devices. In addition, the permittee must describe the storm water pollutant source area or activity (e.g., storage areas, loading and unloading areas, above ground storage of chemicals) to be controlled by each storm water management practice.

The plan must consider management practices, such as berms for uncovered storage areas, uncovered loading and unloading areas, above ground liquid storage and waste management areas. The installation of detention ponds must also be considered.

(4) Comprehensive Site Compliance Evaluation. Qualified personnel shall conduct site compliance evaluations at appropriate intervals specified in the plan, but in no case less than once a year. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with

industrial activity shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, and other structural pollution prevention measures identified in the plan shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the inspection, the description of potential pollutant sources identified in the plan in accordance with paragraph XI.Z.3.a.(2) of this section (Description of Potential Pollutant Sources) and pollution prevention measures and controls identified in the plan in accordance with paragraph XI.Z.3.a.(3) of this section (Measures and Controls) shall be revised as appropriate within 2 weeks of such inspection and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the inspection.

(c) A report summarizing the scope of the inspection, personnel making the inspection, the date(s) of the inspection, major observations relating to the implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph XI.Z.3.a.(4)(b) (above) of the permit shall be made and retained as part of the storm water pollution prevention plan for at least 1 year after coverage under this permit terminates. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) The storm water pollution prevention plan must describe the scope and content of comprehensive site inspections that qualified personnel will conduct to 1) confirm the accuracy of the description of potential pollution

sources contained in the plan, 2) determine the effectiveness of the plan, and 3) assess compliance with the terms and conditions of the permit. Comprehensive site compliance evaluations should be conducted twice a year. The individual or individuals who will conduct the inspections must be identified in the plan and should be members of the pollution prevention team. Inspection reports must be retained for at least 3 years after the date that the permit expires.

(e) Where compliance evaluation schedules overlap with inspections required under XI.Z.3.a.(3)(d), the compliance evaluation may be conducted in place of one such inspection.

4. Numeric Effluent Limitations. There are no additional numeric effluent limitations beyond those described in Part V. of this permit.

5. Monitoring and Reporting Requirements

a. Analytical Monitoring Requirements. During the period beginning (insert date 1 year after permit issuance) lasting through (insert date 2 years after permit issuance) and the period beginning (insert date 3 years after permit issuance) lasting through (insert date 4 years after permit issuance), permittees with leather tanning and finishing facilities must monitor their storm water discharges associated with industrial activity at least quarterly (4 times per year) except as provided in paragraphs 5.a.(3) (Sampling Waiver), 5.a.(4) (Representative Discharge), and 5.a.(5) (Alternative Certification). Leather tanning and finishing facilities are required to monitor their storm water discharges for the pollutants of concern listed in Table Z-1 below. Facilities must report in accordance with 5.b. (Reporting). In addition to the parameters listed in Table Z-1 below, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event that generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

TABLE Z-1.—MONITORING REQUIREMENTS

| Pollutants of concern | Monitoring cut-off concentration (mg/L) |
|---|---|
| Five-Day Biological Oxygen Demand (BOD ₅) | 9.0 |
| Total Kjeldahl Nitrogen (TKN) | 1.5 |
| Nitrate and Nitrite Nitrogen | 0.68 |
| Total Recoverable Aluminum | 0.75 |
| Total Recoverable Manganese | 0.05 |

(1) *Monitoring Periods.* Leather tanning and finishing facilities shall monitor samples collected during the sampling periods of: January to March, April to June, July to September, and October to December for the years specified in paragraph a. (above).

(2) *Sample Type.* A minimum of one grab sample shall be taken. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable. If storm water discharges associated with industrial activity commingle with process or non-process water, then where practicable permittees must attempt to sample the storm water discharge before it mixes with the non-storm water discharge.

(3) *Sampling Waiver*

(a) *Adverse Conditions*—When a discharger is unable to collect samples during one of the monitoring periods specified in paragraph b. (Monitoring Periods) because of adverse climatic conditions, the discharger may collect two samples from the two separate qualifying events in the next monitoring period and submit this data. Adverse weather conditions that may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(b) *Low Concentration Waiver*—When the average concentration for a pollutant calculated from all monitoring data collected from an outfall during the monitoring period [insert date 1 year

after permit issuance] lasting through [insert date 2 years after permit issuance] is less than the corresponding value for that pollutant listed in Table Z-1 under the column Monitoring Cut-off Concentration, a facility may waive monitoring and reporting requirements in the monitoring period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance]. The facility must submit to the Director, in lieu of the monitoring data, a certification that there has not been a significant change in industrial activity or the pollution prevention measures in area of the facility which drains to the outfall for which sampling was waived.

(4) *Representative Discharge.* When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may test the effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan. The permittee shall include the description of the location of the outfalls, explanation of why outfalls are expected to discharge substantially identical effluents, and estimate of the size of the drainage area and runoff coefficient with the Discharge Monitoring Report.

(5) *Alternative Certification.* A discharger is not subject to the monitoring requirements of this section provided the discharger makes a

certification for a given outfall, on an annual basis, under penalty of law, signed in accordance with Part VII.C. (Signatory Requirements), that material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, industrial machinery or operations, or significant materials from past industrial activity that are located in areas of the facility within the drainage area of the outfall are not presently exposed to storm water and are not expected to be exposed to storm water for the certification period. Such certification must be retained in the storm water pollution prevention plan, and submitted to EPA in accordance with Part VI.C. of this permit.

b. *Reporting.* Permittees with leather tanning and finishing facilities shall submit monitoring results for each outfall associated with industrial activity [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the reporting period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March [insert the date 2 years after permit issuance]. Monitoring results [or a certification in accordance with Sections (3), (4), or (5) above] obtained during the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance] shall be submitted on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March. A separate Discharge Monitoring Report Form is required for each quarterly sampling period. Signed copies of Discharge Monitoring Reports, or said certifications, shall be submitted to the Director of the NPDES program at the address of the appropriate Regional Office listed in Part VI.C. of the fact sheet.

(1) *Additional Notification.* In addition to filing copies of discharge monitoring reports in accordance with paragraph b (above), leathering tanning and finishing facilities with at least one

storm water discharge associated with industrial activity through a large or medium municipal separate storm sewer system (systems serving a population of 100,000 or more) must submit signed copies of discharge monitoring reports to the operator of the municipal separate storm sewer system in accordance with the dates provided in paragraph b (above).

c. Monthly Visual Examination of Storm Water Quality. Facilities shall perform and document a visual examination of a representative storm water discharge associated with industrial activity exposed to storm water. The examination must be made at least once in each month during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(1) Examinations shall be made of samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 1 hour) of when the runoff or snowmelt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The inspection must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Where practicable, the same individual should carry out the collection and examination of discharges for entire permit term.

(2) Visual observation reports must be maintained onsite in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

(3) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the observation

data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

(4) When a discharger is unable to collect samples over the course of the monitoring period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricanes, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

AA. Storm Water Discharges Associated With Industrial Activity From Fabricated Metal Products Industry

1. Discharges Covered Under This Section. The requirements listed under this section shall apply to storm water discharges associated with industrial activity from the fabricated metals industry, Standard Industrial Classification (SIC) Codes listed below, except for electrical related industries:

- SIC Major Group 34 Fabricated Metal Products
- SIC 391 Jewelry, Silverware, and Plated Ware.

When an industrial facility, described by the above eligibility provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

If monitoring and pollution prevention plan requirements of another industrial activity section of this permit apply to co-located industrial activities at an industrial facility, the eligibility provisions of that industrial activity section shall not preclude the operator of the industrial facility from complying with the applicable monitoring and pollution prevention plan requirements of that section.

2. Special Conditions

a. Prohibition of Non-storm Water Discharges

(1) This permit does not authorize the discharge of process wastewater. Discharges of storm water commingled with process wastewater are not authorized under this permit.

3. Storm Water Pollution Prevention Plan Requirements

a. Contents of Plan. The plan shall include, at a minimum, the following items:

(1) *Pollution Prevention Team.* Each plan shall identify a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team that are responsible for developing the storm water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

(2) *Description of Potential Pollutant Sources.* Each plan shall provide a description of potential sources which may reasonably be expected to add significant amounts of pollutants to storm water discharges or which may result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. Each plan shall identify all industrial activities and significant materials which may potentially be significant pollutant sources. Each plan shall specifically identify the physical features of the facility that may contribute to storm water runoff. Each plan shall include, at a minimum:

(a) Drainage

(i) A site map indicating an outline of the portions of the drainage area of each storm water outfall that are within the facility boundaries, each existing structural control measure to reduce pollutants in storm water runoff, surface water bodies, locations where significant materials are exposed to precipitation, locations where major spills or leaks identified under Part

IX.AA.3.a.(2)(c) (Spills and Leaks) of this permit have occurred, and the locations of the following activities where such activities are exposed to precipitation: raw metal storage areas, finished metal storage areas, scrap disposal collection sites, equipment storage areas, retention and detention basins, temporary diversion dikes or berms, permanent diversion dikes or berms, right-of-way or perimeter diversion devices, any sediment traps or barriers, vehicle and equipment maintenance and/or cleaning areas, loading/unloading areas, locations used for the treatment, storage or disposal of wastes, liquid storage tanks, processing areas including outside painting areas, wood preparation, recycling and raw material storage.

(ii) For each area of the facilities that generates storm water discharges associated with industrial activity with a reasonable potential for containing significant amounts of pollutants, a prediction of the direction of flow, and an identification of the types of pollutants which are likely to be present in storm water discharges associated with industrial activity. Factors to consider include the toxicity of chemical; quantity of chemicals used, produced or discharged; the likelihood of contact with storm water; and history of significant leaks or spills of toxic or hazardous pollutants. A prediction of the direction of flow and identity of the types of pollutants which are likely to be present in storm water discharges, in particular, flows with a significant potential for causing erosion shall be identified such as heavy equipment use areas, drainage from roofs, parking lots, etc.

(b) *Inventory of Exposed Materials*—An inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such inventory shall include a narrative description of significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of 3 years prior to the date of the issuance of this permit and the present; method and location of onsite storage or disposal; materials management practices employed to minimize contact of materials with storm water runoff between the time of 3 years prior to the date of the issuance of this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of any treatment the storm water receives.

(c) *Spills and Leaks*—A list of significant spills and significant leaks of

toxic or hazardous pollutants that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility after the date of 3 years prior to the effective date of this permit. Significant spills that should be considered for the fabricated metals industry includes but are not limited to chromium, toluene, pickle liquor, sulfuric acid, zinc and other water priority chemicals and hazardous chemicals and wastes. Such list shall be updated as appropriate during the term of the permit.

(d) *Sampling Data*—A summary of existing discharge sampling data describing pollutants in storm water discharges from the facility, including a summary of sampling data collected during the term of this permit. The data collected as a representative sampling protocol for the approved facilities in the group should be made a part of the sampling data for these facilities.

(e) *Risk Identification and Summary of Potential Pollutant Sources*—A narrative description of the potential pollutant sources from the following activities: loading and unloading operations for paints, chemicals and raw materials; outdoor storage activities for raw materials, paints, empty containers, corn cob, chemicals, scrap metals; outdoor manufacturing or processing activities such as grinding, cutting, degreasing, buffing, brazing, etc.; significant dust or particulate generating processes; and onsite waste disposal practices for spent solvents, sludge, pickling baths, shavings, ingots pieces, refuse and waste piles. The description shall specifically list any significant potential source of pollutants at the site and for each potential source, any pollutant or pollutant parameter (e.g., biochemical or chemical oxygen demand, chromium, total suspended solids, oil and grease, etc.) of concern shall be identified.

(3) *Measures and Controls*. Each facility covered by this permit shall develop a description of storm water management controls appropriate for the facility, and implement such controls. The appropriateness and priorities of controls in a plan shall reflect identified potential sources of pollutants at the facility. The description of storm water management controls shall address the following minimum components, including a schedule for implementing such controls:

(a) *Good Housekeeping*—Good housekeeping requires the maintenance of areas which may contribute pollutants to storm water discharges in a clean, orderly manner. The description of storm water management

controls shall at a minimum address the following components of the plan, including a schedule for implementing the plan that shall not exceed the stipulated timeframe identified in this permit.

(i) *Good Housekeeping*—Fabricating industries shall include the following best management practices in their storm water pollution prevention plan:

- *Metal Fabricating Areas*—Measures for maintaining clean, dry, orderly conditions in these areas. Use of dry clean-up techniques should be considered in the plan.

- *Storage Areas for Raw Metal*—Measures to keep these areas free of conditions that could cause spills or leakage of materials. Storage areas should be maintained for easy access in case spill clean up is necessary. Stored materials should be able to be identified correctly and quickly.

- *Receiving, Unloading, and Storage Areas*—Measures to prevent spills and leaks; plan for quick remedial clean up and instruct employees on the use of clean-up techniques.

- *Storage of Equipment*—The plan should provide measures for preparing equipment for storage and the proper method to store equipment including protecting with covers, storing indoors. The plan should include clean-up measures for equipment that will be stored outdoors to remove potential pollutants.

(b) *Preventive Maintenance*—Preventive maintenance measures shall include timely inspection and maintenance of storm water management devices (e.g., cleaning oil/water separators, catch basins) as well as inspecting and testing facility equipment and systems to uncover conditions that could cause breakdowns or failures resulting in discharges of pollutants to surface waters, and ensuring appropriate maintenance of such equipment and systems. In particular for the fabricated metal industries special consideration should be given to the following areas for preventive maintenance:

- *Metal Working Fluid Areas*—The plan should include measures that identify controls particularly for storage of metal working fluids.

- *Cleaners and Rinse Water*—Measures should be included to control and cleanup spills of solvents and other liquid cleaners; control sand buildup and disbursement from sand-blasting operations, preventing exposure of recyclable wastes; and employ substitute cleaners when possible.

- *Raw Steel Handling Storage*—The plan should include measures controlling or recovering scrap metals,

finer, and iron dust, including measures for containing materials within storage handling areas.

- **Paints and Painting Equipment**—The plan should consider control measures to prevent or minimize exposure of paint and painting equipment from exposure to storm water.

- **Lubricating Oil and Hydraulic Fluid Operations**—The plan should include using devices or monitoring equipment to determine and control leaks and overflows, including the installation of perimeter controls such as dikes, curbs, grass filter strips, or other equivalent measure.

- **Chemical Storage Areas**—The plan should clearly identify materials, proper storage that prevents storm water contamination and prevents accidental spillage. The plan should include a program to inspect containers, and identify proper disposal and spill controls.

- (c) **Spill Prevention and Response Procedures**—Areas where potential spills which can contribute pollutants to storm water discharges can occur, and their accompanying drainage points shall be identified clearly in the storm water pollution prevention plan. Where appropriate, specifying material handling procedures, storage requirements, and use of equipment such as diversion valves in the plan should be considered. Procedures for cleaning up spills shall be identified in the plan and made available to the appropriate personnel. The necessary equipment to implement a clean up should be available to personnel.

- (d) **Inspections**—Qualified facility personnel shall be identified to inspect designated equipment and areas of the facility at appropriate intervals specified in the plan. Metal fabricators shall at a minimum include the following areas for inspection: raw metal storage areas, finished product storage areas, material and chemical storage areas, recycling areas, loading and unloading areas, equipment storage areas, paint areas, fueling and maintenance areas, and waste management areas. A set of tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections. Records of inspections shall be maintained.

- (e) **Employee Training**—Employee training programs shall inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise responsible for storm water management at all levels of responsibility of the components and goals of the storm water pollution prevention plan.

Training should address topics such as spill response, good housekeeping, and material management practices. A pollution prevention plan shall identify periodic dates for such training.

- (f) **Recordkeeping and Internal Reporting Procedures**—A description of incidents (such as spills, or other discharges), along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. Inspections and maintenance activities shall be documented and records of such activities shall be incorporated into the plan.

- (g) **Non-storm Water Discharges**

- (i) The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit. Such certification may not be feasible if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit which receives the discharge. In such cases, the source identification section of the storm water pollution plan shall indicate why the certification required by this part was not feasible, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with paragraph XI.AA.3.a.(3)(g)(iii) (below).

- (ii) Except for flows from fire fighting activities, sources of non-storm water listed in Part III.A. (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

- (iii) **Failure to Certify**—Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director by [Insert date 270 days after permit issuance] or, for facilities which begin to discharge storm water

associated with industrial activity after [Insert date 270 days after permit issuance], 180 days after submitting a notice of intent to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: the procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States which are not authorized by an NPDES permit are unlawful, and must be terminated.

- (h) **Sediment and Erosion Control**—The plan shall identify areas which, due to topography, activities, or other factors, have a high potential for significant soil erosion. The plan shall identify structural, vegetative, and/or stabilization measures to be used to limit erosion. These shall include but not be limited to grass swales, filter strips, treatment works, or other equivalent measures. Metal fabricators must include in their plan measures to minimize erosion caused by the high volume of traffic from heavy equipment for delivery to and from the facility and for equipment operating at the facility on a daily basis such as forklifts, cranes, etc.

- (i) **Management of Runoff**—The plan shall contain a narrative consideration of the appropriateness of traditional storm water management practices (practices other than those which control the generation or source(s) of pollutant(s) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. The plan shall provide that measures that the permittee determines to be reasonable and appropriate shall be implemented and maintained. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activities under the SIC codes identified under paragraph XI.AA.1. of this section shall be considered when determining reasonable and appropriate measures. Appropriate measures may include: vegetative swales and practices, reuse of collected storm water (such as for a process or as an irrigation source), inlet controls (such as oil/water separators), snow management activities, infiltration devices, and wet detention/retention devices.

- (4) **Comprehensive Site Compliance Evaluation**. Qualified personnel shall conduct site compliance evaluations at

least twice a year, once annually during wet weather and once during dry weather as specified in the plan. Such evaluations shall include:

(a) Areas contributing to a storm water discharge associated with storage of raw metals, storage of spent solvents and chemicals, outdoor paint areas, drainage from roof, unloading and loading areas, equipment storage areas, recycling areas, and retention ponds (sludge); included but not limited to chromium, zinc, lubricating oil, solvents, aluminum, oil and grease, methyl ethyl ketone, steel, and other related materials shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, such as detention basins and channels, gutters or drains to direct discharge flow, oil/water separators in storm drains, containment structures, concrete pads, sediment and erosion control measures, and other structural pollution prevention measures identified in the plan shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment and containment drums, shall be made to determine if the equipment is functioning properly and that drums are not in a corrosive or deteriorating state.

(b) Based on the results of the inspection, the description of potential pollutant sources identified in the plan in accordance with paragraph XI.AA.3.a.(2) of this section (Description of Potential Pollutant Sources) and pollution prevention measures and controls identified in the plan in accordance with paragraph XI.AA.3.a.(3) of this section (Measures and Controls) shall be revised as appropriate within 2 weeks of such inspection and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the inspection.

(c) A report summarizing the scope of the inspection, personnel making the inspection, the date(s) of the inspection, major observations relating to the implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph XI.AA.3.a.(4)(b) (above) of the permit shall be made and retained as part of the storm water pollution prevention plan for at least 1 year after coverage under this permit terminates. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) Where compliance evaluation schedules overlap with inspections required under 3.a.(3)(d), the compliance evaluation may be

conducted in place of one such inspection.

4. *Numeric Effluent Limitations.* There are no additional numeric effluent limitations beyond those described in Part V. of this permit.

5. *Monitoring and Reporting Requirements*

a. *Analytical Monitoring Requirements.* During the period beginning [insert date 1 year after permit issuance] lasting through [insert date 2 years after permit issuance] and the period beginning [insert date 3 years after permit issuance] lasting through [insert date 4 years after permit issuance], permittees with metal fabricating facilities must monitor their storm water discharges associated with industrial activity at least quarterly (4 times per year) except as provided in paragraphs 5.a.(3) (Sampling Waiver), 5.a.(4) (Representative Discharge), and 5.a.(5) (Alternative Certification). Metal fabricating facilities are required to monitor their storm water discharges for the pollutants of concern listed in Table AA-1 below. Facilities must report in accordance with 5.b. (Reporting). In addition to the parameters listed in Table AA-1 below, the permittee shall provide the date and duration (in hours) of the storm event(s) sampled; rainfall measurements or estimates (in inches) of the storm event that generated the sampled runoff; the duration between the storm event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) storm event; and an estimate of the total volume (in gallons) of the discharge sampled.

TABLE AA-1.—MONITORING REQUIREMENTS

| Pollutants of concern | Monitoring cut-off concentration (mg/L) |
|-----------------------------------|---|
| Total Recoverable Aluminum | 0.75 |
| Total Recoverable Copper | 0.009 |
| Total Recoverable Iron | 0.3 |
| Total Recoverable Manganese | 0.05 |
| Total Recoverable Zinc | 0.065 |
| Nitrate + Nitrite Nitrogen | 0.68 |

(1) *Monitoring Periods.* Metal fabricating facilities shall monitor samples collected during the sampling periods of: January to March, April to June, July to September, and October to December for the years specified in paragraph a. (above).

(2) *Sample Type.* A minimum of one grab sample shall be taken. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72

hours from the previously measurable (greater than 0.1 inch rainfall) storm event. The grab sample shall be taken during the first 30 minutes of the discharge. If the collection of a grab sample during the first 30 minutes is impracticable, a grab sample can be taken during the first hour of the discharge, and the discharger shall submit with the monitoring report a description of why a grab sample during the first 30 minutes was impracticable.

If storm water discharges associated with industrial activity commingle with process or nonprocess water, then where practicable permittees must attempt to sample the storm water discharge before it mixes with the non-storm water discharge.

(3) *Sampling Waiver*

(a) *Adverse Conditions*—When a discharger is unable to collect samples during one of the monitoring periods specified in paragraph b. (Monitoring Periods) because of adverse climatic

conditions, the discharger may collect two samples from the two separate qualifying events in the next monitoring period and submit this data. Adverse weather conditions that may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(b) Low Concentration Waiver. When the average concentration for a pollutant calculated from all monitoring data collected from an outfall during the monitoring period (insert date 1 year after permit issuance) lasting through (insert date 2 years after permit issuance) is less than the corresponding value for that pollutant listed in Table AA-1 under the column Monitoring Cut-off Concentration, a facility may waive monitoring and reporting requirements in the monitoring period beginning (insert date 3 years after permit issuance) lasting through (insert date 4 years after permit issuance). The facility must submit to the Director, in lieu of the monitoring data, a certification that there has not been a significant change in industrial activity or the pollution prevention measures in area of the facility which drains to the outfall for which sampling was waived.

(4) Representative Discharge. When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may test the effluent of one of such outfalls and report that the quantitative data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan. The permittee shall include the description of the location of the outfalls, explanation of why outfalls are expected to discharge substantially identical effluents, and estimate of the size of the drainage area

and runoff coefficient with the Discharge Monitoring Report.

(5) Alternative Certification. A discharger is not subject to the monitoring requirements of this section provided the discharger makes a certification for a given outfall, on an annual basis, under penalty of law, signed in accordance with Part VII.G. (Signatory Requirements), that material handling equipment or activities, raw materials, intermediate products, final products, waste materials, by-products, industrial machinery or operations, or significant materials from past industrial activity that are located in areas of the facility within the drainage area of the outfall are not presently exposed to storm water and are not expected to be exposed to storm water for the certification period. Such certification must be retained in the storm water pollution prevention plan, and submitted to EPA in accordance with Part VI.C. of this permit.

b. Reporting. Permittees with metal fabricating facilities shall submit monitoring results for each outfall associated with industrial activity (or a certification in accordance with Sections (3), (4), or (5) above) obtained during the reporting period beginning (insert date 1 year after permit issuance) lasting through (insert date 2 years after permit issuance) on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March (insert the date 2 years after permit issuance). Monitoring results (or a certification in accordance with Sections (3), (4), or (5) above) obtained during the period beginning (insert date 3 years after permit issuance) lasting through (insert date 4 years after permit issuance) shall be submitted on Discharge Monitoring Report Form(s) postmarked no later than the 31st day of the following March. A separate Discharge Monitoring Report Form is required for each quarterly sampling period. Signed copies of Discharge Monitoring Reports, or said certifications, shall be submitted to the Director of the NPDES program at the address of the appropriate Regional Office listed in Part VI.G. of the fact sheet.

(1) Additional Notification. In addition to filing copies of discharge monitoring reports in accordance with paragraph b (above), metal fabricating facilities with at least one storm water discharge associated with industrial activity through a large or medium municipal separate storm sewer system (systems serving a population of 100,000 or more) must submit signed copies of discharge monitoring reports to the operator of the municipal separate

storm sewer system in accordance with the dates provided in paragraph b (above).

c. Monthly Visual Examination of Storm Water Quality. Facilities shall perform and document a visual examination of a representative storm water discharge associated with industrial activity exposed to storm water. The examination must be made at least once in each month during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(1) Examinations shall be made of samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed 1 hour) of when the runoff or snowmelt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The inspection must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. Where practicable, the same individual should carry out the collection and examination of discharges for entire permit term.

(2) Visual observation reports must be maintained onsite in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

(3) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the observation data also applies to the substantially identical outfall(s) provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explains in detail why the outfalls are expected to discharge substantially

identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area (e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)) shall be provided in the plan.

When a discharger is unable to collect samples over the course of the monitoring period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

AB. Storm Water Discharges Associated With Industrial Activity From Facilities That Manufacture Transportation Equipment, Industrial, or Commercial Machinery

1. Discharges Covered Under This Section

a. This section covers storm water discharges associated with industrial activity transportation equipment, industrial or commercial machinery manufacturing facilities including: Industrial and Commercial Machinery and Computer Equipment Standard Industrial Classification (SIC) Major Group 35 except SIC 357, and Transportation Equipment (SIC Major Group 37, except SIC 373). Facilities with industrial plant yards; material handling sites; refuse sites; sites used for application or disposal of process wastewaters; sites used for storage and maintenance of material handling equipment; sites used for residual treatment, storage, or disposal; shipping and receiving areas; manufacturing buildings; storage areas for raw material and intermediate and finished products; and areas where industrial activity has taken place in the past and significant materials remain and are exposed to storm water are covered for by this permit.

When an industrial facility, described by the above eligibility provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all

applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

If monitoring and pollution prevention plan requirements of another industrial activity section of this permit apply to co-located industrial activities at an industrial facility, the eligibility provisions of that industrial activity section shall not preclude the operator of the industrial facility from complying with the applicable monitoring and pollution prevention plan requirements of that section.

2. *Special Conditions.* There are no additional requirements other than those in Part III. of the permit.

3. Storm Water Pollution Prevention Plan Requirements

a. *Contents of Plan.* The plan shall include, at a minimum, the following items:

(1) *Pollution Prevention Team.* Each plan shall identify the specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team that are responsible for developing the storm water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

(2) *Description of Potential Pollutant Sources.* Each plan shall provide a description of potential sources which may reasonably be expected to add significant amounts of pollutants to storm water discharges or which may result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. Each plan shall identify all activities and significant materials which may potentially be significant pollutant sources. Each plan shall include, at a minimum:

(a) *Site Map*—A site map indicating the pattern of storm water drainage, existing structural control measures to reduce pollutants in storm water runoff, surface water bodies, locations where significant materials are exposed to precipitation, and locations where major spills or leaks identified under Part XI.AB.3.a.(2)(c) (Spills and Leaks) of

this permit have occurred since 3 years prior to the effective date of this permit. The map must also indicate the locations of all industrial activities that are exposed to precipitation, including, but not limited to: Loading/unloading areas; waste treatment; storage and disposal locations; liquid storage tanks; vents and stacks from metal processing and similar operations; significant dust or particulate generating areas; and any other processing and storage areas exposed to storm water. Flows with a significant potential for causing erosion shall also be identified.

(b) *Inventory of Exposed Materials*—An inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such inventory shall include a narrative description of significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of 3 years prior to the date of the issuance of this permit and the present; method and location of onsite storage or disposal; materials management practices employed to minimize contact of materials with storm water runoff between the time of 3 years prior to the date of the issuance of this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of any treatment the storm water receives.

(c) *Spills and Leaks*—A list of significant spills and significant leaks of toxic or hazardous pollutants that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility after the date of 3 years prior to the effective date of this permit. Significant spills include, but are not limited to, releases of oil or hazardous substances in excess of quantities that are reportable under Section 311 of CWA (see 40 CFR 110.10 and 117.21) or Section 102 of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) (see 40 CFR 302.4). Significant spills may also include releases of oil or hazardous substances that are not excess of reporting requirements and releases of materials that are not classified as oil or hazardous substance. Such list shall be updated as appropriate during the term of the permit.

(d) *Sampling Data*—A summary of existing discharge sampling data describing pollutants in storm water discharges from the facility, including a summary of sampling data collected during the term of this permit.

(e) *Risk Identification and Summary of Potential Pollutant Sources*—A narrative description of the potential pollutant sources from the following activities: Loading and unloading operations; outdoor storage activities; significant dust or particulate generating processing activities; and onsite waste disposal. The description shall specifically list any significant potential source of pollutants at the site and for each potential source, any pollutant or pollutant parameter (e.g., oil and grease, etc.) of concern shall be identified.

(3) *Measures and Controls*. Each facility covered by this permit shall develop a description of storm water management controls appropriate for the facility, and implement such controls. The appropriateness and priorities of controls in a plan shall reflect identified potential sources of pollutants at the facility. The description of storm water management controls shall address the following minimum components, including a schedule for implementing such controls:

(a) *Good Housekeeping*—Good housekeeping requires the maintenance of areas which may contribute pollutants to storm water discharges in a clean, orderly manner. Areas where good housekeeping practices should be implemented are storage areas for raw materials, waste materials and finished products; loading/unloading areas; and waste disposal areas for hazardous and nonhazardous wastes. Examples of good housekeeping measures include sweeping; labelling drums containing hazardous materials; and preventive monitoring practices (e.g., routine observation of manufacturing processes).

(b) *Preventive Maintenance*—A preventive maintenance program shall involve timely inspection and maintenance of storm water management devices (e.g., cleaning oil/water separators, catch basins) as well as inspecting and testing facility equipment and systems to uncover conditions that could cause breakdowns or failures resulting in discharges of pollutants to surface waters, and ensuring appropriate maintenance of such equipment and systems.

(c) *Spill Prevention and Response Procedures*—Areas where potential spills which can contribute pollutants to storm water discharges can occur, and their accompanying drainage points shall be identified clearly in the storm water pollution prevention plan. Areas to be identified should include loading/unloading areas, outdoor storage areas, and waste management areas exposed to storm water. Where appropriate,

specifying material handling procedures, storage requirements, and use of equipment such as diversion valves in the plan should be considered. Procedures for cleaning up spills shall be identified in the plan and made available to the appropriate personnel. The necessary equipment to implement a cleanup should be available to personnel.

(d) *Inspections*—Qualified facility personnel shall be identified to inspect designated equipment and areas of the facility annually. At a minimum, the following areas, where the potential for exposure to storm water exists, must be inspected on a regularly scheduled basis: loading and unloading areas for all significant materials; storage areas, including associated containment areas; waste management units; and vents and stacks from industrial activities. For any problems identified during inspections, the plan shall be revised to include measures to address these problems. A set of tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections. Records of inspections shall be maintained.

(e) *Employee Training*—Employee training programs shall inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise responsible for storm water management at all levels of responsibility of the components and goals of the storm water pollution prevention plan. Training should address topics such as spill response, good housekeeping, material management practices, unloading/loading practices, outdoor storage areas, waste management practices, proper handling procedures of hazardous waste, and improper connections to the storm sewer. At a minimum, this training should be provided annually. The pollution prevention plan shall identify frequencies and approximate dates for such training.

(f) *Recordkeeping and Internal Reporting Procedures*—A description of incidents (such as spills, or other discharges), along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. Inspections and maintenance activities shall be documented and records of such activities shall be incorporated into the plan. Ineffective BMPs should be reported and the date of their corrective actions noted.

(g) *Non-storm Water Discharges*.

(i) The plan shall include a certification that the discharge has been tested or evaluated for the presence of

non-storm water discharges as identified in Part III.A.2.a. of this permit. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit. Such certification may not be feasible if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit which receives the discharge. In such cases, the source identification section of the storm water pollution plan shall indicate why the certification required by this part was not feasible, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with Part XI.A.B.3.a.(3)(g)(iv) (Failure to Certify) of this permit.

(ii) Except for flows from fire fighting activities, sources of non-storm water listed in Part III.A. (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

(iii) If the facility discharges wastewater, other than storm water via an existing NPDES permit, a copy of the NPDES permit authorizing the discharge must be attached to the plan. Similarly, if the facility submitted an application for an NPDES permit for non-storm water discharges, but has not yet received that permit, a copy of the permit application must be attached. Upon issuance or reissuance of an NPDES permit, the facility must modify its plan to include a copy of that permit. For facilities that discharge wastewater, other than solely domestic wastewater, to a Publicly Owned Treatment Works (POTW), the facility must notify the POTW of its discharge. Proof of this notification should be attached to the plan in the form of either (1) a copy of the permit issued by the treatment plant to the facility or (2) a copy of a notification letter to the POTW. Notification should identify, in general, the types of wastewater discharged to the POTW, including any storm water

discharges. In any of these cases, specific permit conditions must be considered in the plan.

(iv) *Failure to Certify*—Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director by [Insert date 270 days after permit issuance] or, for facilities which begin to discharge storm water associated with industrial activity after [Insert date 270 days after permit issuance], 180 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: the procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States which are not authorized by an NPDES permit are unlawful, and must be terminated.

(h) *Sediment and Erosion Control*—The plan shall identify areas which, due to topography, activities, or other factors, have a high potential for significant soil erosion, and identify structural, vegetative, and/or stabilization measures to be used to limit erosion.

(i) *Management of Runoff*—The plan shall contain a narrative consideration of the appropriateness of traditional storm water management practices (practices other than those which control the generation or source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. The plan shall provide that measures that the permittee determines to be reasonable and appropriate shall be implemented and maintained. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity (see paragraph XI.AB.3.a.(2) (Description of Potential Pollutant Sources) of this permit) shall be considered when determining reasonable and appropriate measures. Appropriate measures may include: vegetative swales and practices, reuse of collected storm water (such as for a process or as an irrigation source), inlet controls (such as oil/water separators), snow management activities, infiltration devices, and wet detention/retention devices. In addition, the permittee must describe the storm water pollutant source area or activity (storage areas, loading/unloading) to be

controlled by each storm water management practice.

(4) *Comprehensive Site Compliance Evaluation*. Qualified personnel shall conduct site compliance evaluations at appropriate intervals specified in the plan, but in no case less than once a year. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with industrial activity shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, and other structural pollution prevention measures identified in the plan shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the inspection, the description of potential pollutant sources identified in the plan in accordance with Part XI.AB.3.a.(2) (Description of Potential Pollutant Sources) of this permit and pollution prevention measures and controls identified in the plan in accordance with paragraph XI.AB.3.a.(3) (Measures and Controls) of this permit shall be revised as appropriate within 2 weeks of such inspection and shall provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the inspection.

(c) A report summarizing the scope of the inspection, personnel making the inspection, the date(s) of the inspection, major observations relating to the implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph XI.AB.3.a.(4)(b) (above) of the permit shall be made and retained as part of the storm water pollution prevention plan for at least 1 year after coverage under this permit terminates. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) Where compliance evaluation schedules overlap with inspections required under 3.a.(3)(d), the

compliance evaluation may be conducted in place of one such inspection.

4. *Numeric Effluent Limitations*. There are no additional numeric limitations beyond those described in Part V. of this permit.

5. *Monitoring and Reporting Requirements*

a. *Monitoring Requirements*

(1) *Quarterly Visual Examination of Storm Water Quality*. Facilities shall perform and document a visual examination of a representative storm water discharge associated with industrial activity exposed to storm water. The examination must be made at least once in each designated period [described in (a), below] during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(a) Examinations shall be conducted in each of the following periods for the purposes of visually inspecting storm water quality associated with storm water runoff or snow melt: December to February; March to May; June to August; and September to November.

(b) Examinations shall be made of samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed one hour) of when the runoff or snowmelt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The inspection must be conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. EPA expects that whenever practicable the same individual will carry out the collection and examination of discharges for the life of the permit.

When a discharger is unable to collect samples over the course of the monitoring period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

(c) Visual observation reports must be maintained onsite in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

(d) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the observation data also applies to the substantially identical outfalls provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explaining in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area [e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)] shall be provided in the plan.

(e) When a discharger is unable to collect samples over the course of the monitoring period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

AC. Storm Water Discharges Associated With Industrial Activity From Facilities That Manufacture Electronic and Electrical Equipment and Components, Photographic and Optical Goods

1. *Discharges Covered Under This Section.* The requirements listed under this section shall apply to all storm water discharges associated with industrial activity from facilities commonly identified by Standard Industrial Classification (SIC) major groups 36 and 38 and industrial SIC

group 357. Major group 36 includes electronic and other electrical equipment and components, except computer equipment. Major group 38 includes measuring, analyzing, and controlling instruments; photographic, medical and optical goods; watches and clocks. Industrial group 357 includes computer and office equipment.

When an industrial facility, described by the above eligibility provisions of this section, has industrial activities being conducted onsite that meet the description(s) of industrial activities in another section(s), that industrial facility shall comply with any and all applicable monitoring and pollution prevention plan requirements of the other section(s) in addition to all applicable requirements in this section. The monitoring and pollution prevention plan terms and conditions of this multi-sector permit are additive for industrial activities being conducted at the same industrial facility (co-located industrial activities). The operator of the facility shall determine which other monitoring and pollution prevention plan section(s) of this permit (if any) are applicable to the facility.

If monitoring and pollution prevention plan requirements of another industrial activity section of this permit apply to co-located industrial activities at an industrial facility, the eligibility provisions of that industrial activity section shall not preclude the operator of the industrial facility from complying with the applicable monitoring and pollution prevention plan requirements of that section.

2. Special Conditions

a. *Prohibition of Non-storm Water Discharges.* Other than as provided in use this Section III.A. of this permit, non-storm water discharges are not authorized by this permit.

3. Storm Water Pollution Prevention Plan Requirements

a. *Contents of Plan.* The plan shall include, at a minimum, the following items:

(1) *Pollution Prevention Team.* Each plan shall identify a specific individual or individuals within the facility organization as members of a storm water Pollution Prevention Team that are responsible for developing the storm water pollution prevention plan and assisting the facility or plant manager in its implementation, maintenance, and revision. The plan shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the facility's storm water pollution prevention plan.

(2) *Description of Potential Pollutant Sources.* Each plan shall provide a description of potential sources which may reasonably be expected to add significant amounts of pollutants to storm water discharges or which may result in the discharge of pollutants during dry weather from separate storm sewers draining the facility. Each plan shall identify all activities and significant materials which may potentially be significant pollutant sources. Each plan shall include, at a minimum:

(a) *Drainage*

(i) A site map indicating an outline of the portions of the drainage area of each storm water outfall that are within the facility boundaries, each existing structural control measure to reduce pollutants in storm water runoff, surface water bodies, locations where significant materials are exposed to precipitation, locations where major spills or leaks identified under Part XI.AC.3.a.(2)(c) (Spills and Leaks) of this permit have occurred, and the locations of the following activities where such activities are exposed to precipitation: fueling stations, vehicle and equipment maintenance and/or cleaning areas, loading/unloading areas, locations used for the treatment, storage or disposal of wastes, liquid storage tanks, processing areas and storage areas.

(ii) For each area of the facility that generates storm water discharges associated with industrial activity with a reasonable potential for containing significant amounts of pollutants, a prediction of the direction of flow, and an identification of the types of pollutants which are likely to be present in storm water discharges associated with industrial activity. Factors to consider include the toxicity of chemical; quantity of chemicals used, produced or discharged; the likelihood of contact with storm water; and history of significant leaks or spills of toxic or hazardous pollutants. Flows with a significant potential for causing erosion shall be identified.

(b) *Inventory of Exposed Materials—* An inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such inventory shall include a narrative description of significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water between the time of 3 years prior to the date of the issuance of this permit and the present; method and location of onsite storage or disposal; materials management practices employed to minimize contact of materials with storm water runoff

between the time of 3 years prior to the date of the issuance of this permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of any treatment the storm water receives.

(c) *Spills and Leaks*—A list of significant spills and significant leaks of toxic or hazardous pollutants that occurred at areas that are exposed to precipitation or that otherwise drain to a storm water conveyance at the facility after the date of 3 years prior to the effective date of this permit. Such list shall be updated as appropriate during the term of the permit.

(d) *Sampling Data*—A summary of existing discharge sampling data describing pollutants in storm water discharges from the facility, including a summary of sampling data collected during the term of this permit.

(e) *Risk Identification and Summary of Potential Pollutant Sources*—A narrative description of the potential pollutant sources from the following activities: loading and unloading operations; outdoor storage activities; outdoor manufacturing or processing activities; significant dust or particulate generating processes; and onsite waste disposal practices. The description shall specifically list any significant potential source of pollutants at the site and for each potential source, any pollutant or pollutant parameter (e.g., biochemical oxygen demand, etc.) of concern shall be identified.

(3) *Measures and Controls*. Each facility covered by this permit shall develop a description of storm water management controls appropriate for the facility, and implement such controls. The appropriateness and priorities of controls in a plan shall reflect identified potential sources of pollutants at the facility. The description of storm water management controls shall address the following minimum components, including a schedule for implementing such controls:

(a) *Good Housekeeping*—Good housekeeping requires the maintenance of areas which may contribute pollutants to storm water discharges in a clean, orderly manner.

(b) *Preventive Maintenance*—A preventive maintenance program shall involve timely inspection and maintenance of storm water management devices (e.g., cleaning oil/water separators, catch basins) as well as inspecting and testing facility equipment and systems to uncover conditions that could cause breakdowns or failures resulting in discharges of

pollutants to surface waters, and ensuring appropriate maintenance of such equipment and systems.

(c) *Spill Prevention and Response Procedures*—Areas where potential spills which can contribute pollutants to storm water discharges can occur, and their accompanying drainage points shall be identified clearly in the storm water pollution prevention plan. Where appropriate, specifying material handling procedures, storage requirements, and use of equipment such as diversion valves in the plan should be considered. Procedures for cleaning up spills shall be identified in the plan and made available to the appropriate personnel. The necessary equipment to implement a clean up should be available to personnel.

(d) *Inspections*—In addition to or as part of the comprehensive site evaluation required under paragraph XI.AC.3.a.(4) of this section, qualified facility personnel shall be identified to inspect designated equipment and areas of the facility at appropriate intervals specified in the plan. A set of tracking or follow-up procedures shall be used to ensure that appropriate actions are taken in response to the inspections. Records of inspections shall be maintained.

(e) *Employee Training*—Employee training programs shall inform personnel responsible for implementing activities identified in the storm water pollution prevention plan or otherwise responsible for storm water management at all levels of responsibility of the components and goals of the storm water pollution prevention plan. Training should address topics such as spill response, good housekeeping and material management practices. A pollution prevention plan shall identify periodic dates for such training.

(f) *Recordkeeping and Internal Reporting Procedures*—A description of incidents (such as spills, or other discharges), along with other information describing the quality and quantity of storm water discharges shall be included in the plan required under this part. Inspections and maintenance activities shall be documented and records of such activities shall be incorporated into the plan.

(g) *Non-storm Water Discharges*

(i) The plan shall include a certification that the discharge has been tested or evaluated for the presence of non-storm water discharges. The certification shall include the identification of potential significant sources of non-storm water at the site, a description of the results of any test and/or evaluation for the presence of non-storm water discharges, the

evaluation criteria or testing method used, the date of any testing and/or evaluation, and the onsite drainage points that were directly observed during the test. Certifications shall be signed in accordance with Part VII.G. of this permit. Such certification may not be feasible if the facility operating the storm water discharge associated with industrial activity does not have access to an outfall, manhole, or other point of access to the ultimate conduit which receives the discharge. In such cases, the source identification section of the storm water pollution plan shall indicate why the certification required by this part was not feasible, along with the identification of potential significant sources of non-storm water at the site. A discharger that is unable to provide the certification required by this paragraph must notify the Director in accordance with paragraph XI.AC.3.a.(3)(g)(iii) (below).

(ii) Except for flows from fire fighting activities, sources of non-storm water listed in Part III.A. (Prohibition of Non-storm Water Discharges) of this permit that are combined with storm water discharges associated with industrial activity must be identified in the plan. The plan shall identify and ensure the implementation of appropriate pollution prevention measures for the non-storm water component(s) of the discharge.

(iii) *Failure to Certify*—Any facility that is unable to provide the certification required (testing for non-storm water discharges), must notify the Director by [Insert date 270 days after permit issuance] or, for facilities which begin to discharge storm water associated with industrial activity after [Insert date 270 days after permit issuance], 180 days after submitting an NOI to be covered by this permit. If the failure to certify is caused by the inability to perform adequate tests or evaluations, such notification shall describe: the procedure of any test conducted for the presence of non-storm water discharges; the results of such test or other relevant observations; potential sources of non-storm water discharges to the storm sewer; and why adequate tests for such storm sewers were not feasible. Non-storm water discharges to waters of the United States which are not authorized by an NPDES permit are unlawful, and must be terminated.

(h) *Sediment and Erosion Control*—The plan shall identify areas which, due to topography, activities, or other factors, have a high potential for significant soil erosion, and identify structural, vegetative, and/or stabilization measures to be used to limit erosion.

(i) *Management of Runoff*—The plan shall contain a narrative consideration of the appropriateness of traditional storm water management practices (practices other than those which control the generation or source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage storm water runoff in a manner that reduces pollutants in storm water discharges from the site. The plan shall provide that measures that the permittee determines to be reasonable and appropriate shall be implemented and maintained. The potential of various sources at the facility to contribute pollutants to storm water discharges associated with industrial activity [see paragraph XI.AC.3.a.(2) of this section (Description of Potential Pollutant Sources)] shall be considered when determining reasonable and appropriate measures. Appropriate measures may include: vegetative swales and practices, reuse of collected storm water (such as for a process or as an irrigation source), inlet controls (such as oil/water separators), snow management activities, infiltration devices, and wet detention/retention devices.

(4) *Comprehensive Site Compliance Evaluation*. Qualified personnel shall conduct site compliance evaluations at appropriate intervals specified in the plan, but in no case less than once a year. Such evaluations shall provide:

(a) Areas contributing to a storm water discharge associated with industrial activity shall be visually inspected for evidence of, or the potential for, pollutants entering the drainage system. Measures to reduce pollutant loadings shall be evaluated to determine whether they are adequate and properly implemented in accordance with the terms of the permit or whether additional control measures are needed. Structural storm water management measures, sediment and erosion control measures, and other structural pollution prevention measures identified in the plan shall be observed to ensure that they are operating correctly. A visual inspection of equipment needed to implement the plan, such as spill response equipment, shall be made.

(b) Based on the results of the inspection, the description of potential pollutant sources identified in the plan in accordance with paragraph XI.AC.3.a.(2) of this section (Description of Potential Pollutant Sources) and pollution prevention measures and controls identified in the plan in accordance with paragraph XI.AC.3.a.(3) of this section (Measures and Controls) shall be revised as appropriate within 2 weeks of such inspection and shall

provide for implementation of any changes to the plan in a timely manner, but in no case more than 12 weeks after the inspection.

(c) A report summarizing the scope of the inspection, personnel making the inspection, the date(s) of the inspection, major observations relating to the implementation of the storm water pollution prevention plan, and actions taken in accordance with paragraph XI.AC.3.a.(4)(b) (above) of the permit shall be made and retained as part of the storm water pollution prevention plan for at least 1 year after coverage under this permit terminates. The report shall identify any incidents of noncompliance. Where a report does not identify any incidents of noncompliance, the report shall contain a certification that the facility is in compliance with the storm water pollution prevention plan and this permit. The report shall be signed in accordance with Part VII.G. (Signatory Requirements) of this permit.

(d) Where compliance evaluation schedules overlap with inspections required under 3.a.(3)(d), the compliance evaluation may be conducted in place of one such inspection.

(4) *Numeric Effluent Limitations*. There are no additional numeric effluent limitations beyond those described in Part V. of this permit.

5. Monitoring and Reporting Requirements

a. Monitoring Requirements

(1) *Quarterly Visual Examination of Storm Water Quality*. Facilities shall perform and document a visual examination of a representative storm water discharge associated with industrial activity exposed to storm water. The examination must be made at least once in each designated period [described in (a), below] during daylight hours unless there is insufficient rainfall or snow melt to produce a runoff event.

(a) Examinations shall be conducted in each of the following periods for the purposes of visually inspecting storm water quality associated with storm water runoff or snow melt: December to February; March to May; June to August; and September to November

(b) Examinations shall be made of samples collected within the first 30 minutes (or as soon thereafter as practical, but not to exceed one hour) of when the runoff or snowmelt begins discharging. The examinations shall document observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution. The inspection must be

conducted in a well lit area. No analytical tests are required to be performed on the samples. All such samples shall be collected from the discharge resulting from a storm event that is greater than 0.1 inches in magnitude and that occurs at least 72 hours from the previously measurable (greater than 0.1 inch rainfall) storm event. EPA expects that whenever practicable the same individual will carry out the collection and examination of discharges for the life of the permit.

(c) Visual observation reports must be maintained onsite in the pollution prevention plan. The report shall include the examination date and time, examination personnel, the nature of the discharge (i.e., runoff or snow melt), visual quality of the storm water discharge (including observations of color, odor, clarity, floating solids, settled solids, suspended solids, foam, oil sheen, and other obvious indicators of storm water pollution), and probable sources of any observed storm water contamination.

(d) When a facility has two or more outfalls that, based on a consideration of industrial activity, significant materials, and management practices and activities within the area drained by the outfall, the permittee reasonably believes discharge substantially identical effluents, the permittee may collect a sample of effluent of one of such outfalls and report that the observation data also applies to the substantially identical outfalls provided that the permittee includes in the storm water pollution prevention plan a description of the location of the outfalls and explaining in detail why the outfalls are expected to discharge substantially identical effluents. In addition, for each outfall that the permittee believes is representative, an estimate of the size of the drainage area (in square feet) and an estimate of the runoff coefficient of the drainage area (e.g., low (under 40 percent), medium (40 to 65 percent), or high (above 65 percent)) shall be provided in the plan.

When a discharger is unable to collect samples over the course of the monitoring period as a result of adverse climatic conditions, the discharger must document the reason for not performing the visual examination. Adverse weather conditions which may prohibit the collection of samples include weather conditions that create dangerous conditions for personnel (such as local flooding, high winds, hurricane, tornadoes, electrical storms, etc.) or otherwise make the collection of a sample impracticable (drought, extended frozen conditions, etc.).

Addendum A

Pollutants Identified in Tables II and III of Appendix D of 40 CFR Part 122

TABLE II.—ORGANIC TOXIC POLLUTANTS IN EACH OF FOUR FRACTIONS IN ANALYSIS BY GAS CHROMATOGRAPHY/MASS SPECTROSCOPY (GS/MS)

Volatiles:

| | |
|-----|----------------------------|
| 1V | acrolein |
| 2V | acrylonitrile |
| 3V | benzene |
| 5V | bromoform |
| 6V | carbon tetrachloride |
| 7V | chlorobenzene |
| 8V | chlorodibromomethane |
| 9V | chloroethane |
| 10V | 2-chloroethylvinyl ether |
| 11V | chloroform |
| 12V | dichlorobromomethane |
| 14V | 1,1-dichloroethane |
| 15V | 1,2-dichloroethane |
| 16V | 1,1-dichloroethylene |
| 17V | 1,2-dichloropropane |
| 18V | 1,3-dichloropropylene |
| 19V | ethylbenzene |
| 20V | methyl bromide |
| 21V | methyl chloride |
| 22V | methylene chloride |
| 23V | 1,1,2,2-tetrachloroethane |
| 24V | tetrachloroethylene |
| 25V | toluene |
| 26V | 1,2-trans-dichloroethylene |
| 27V | 1,1,1-trichloroethane |
| 28V | 1,1,2-trichloroethane |
| 29V | trichloroethylene |
| 31V | vinyl chloride |

Acid Compounds:

| | |
|-----|-----------------------|
| 1A | 2-chlorophenol |
| 2A | 2,4-dichlorophenol |
| 3A | 2,4-dimethylphenol |
| 4A | 4,6-dinitro-o-cresol |
| 5A | 2,4-dinitrophenol |
| 6A | 2-nitrophenol |
| 7A | 4-nitrophenol |
| 8A | p-chloro-m-cresol |
| 9A | pentachlorophenol |
| 10A | phenol |
| 11A | 2,4,6-trichlorophenol |

Pesticides:

| | |
|-----|--------------------|
| 1P | aldrin |
| 2P | alpha-BHC |
| 3P | beta-BHC |
| 4P | gamma-BHC |
| 5P | delta-BHC |
| 6P | chlordane |
| 7P | 4,4'-DDT |
| 8P | 4,4'-DDE |
| 9P | 4,4'-DDD |
| 10P | dieldrin |
| 11P | alpha-endosulfan |
| 12P | beta-endosulfan |
| 13P | endosulfan sulfate |
| 14P | endrin |
| 15P | endrin aldehyde |
| 16P | heptachlor |
| 17P | heptachlor epoxide |
| 18P | PCB-1242 |
| 19P | PCB-1254 |
| 20P | PCB-1221 |
| 21P | PCB-1232 |
| 22P | PCB-1248 |
| 23P | PCB-1260 |
| 24P | PCB-1016 |

| Silver, Total |
| Thallium, Total |
| Zinc, Total |
| Cyanide, Total |
| Phenols, Total |

TABLE V.—TOXIC POLLUTANTS AND HAZARDOUS SUBSTANCES REQUIRED TO BE IDENTIFIED BY EXISTING DISCHARGERS IF EXPECTED TO BE PRESENT

Toxic Pollutants:

Asbestos

Hazardous Substances:

Acetaldehyde

Allyl alcohol

Allyl chloride

Amyl acetate

Aniline

Benzonitrile

Benzyl chloride

Butyl acetate

Butylamine

Captan

Carbaryl

Carbofuran

Carbon disulfide

Chlorpyrifos

Coumaphos

Cresol

Crotonaldehyde

Cyclohexane

2,4-D (2,4-Dichlorophenoxy acetic acid)

Diazinon

Dicamba

Dichlobenil

Dichloro

2,2-Dichloropropionic acid

Dichlorvos

Diethyl amine

Dimethyl amine

Dinitrobenzene

Diquat

Disulfoton

Diuron

Epichlorohydrin

Ethion

Ethylene diamine

Ethylene dibromide

Formaldehyde

Furfural

Guthion

Isoprene

Isopropanolamine

Dodecylbenzenesulfonate

Kelthane

Kepone

Malathion

Mercaptodimethur

Methoxychlor

Methyl mercaptan

Methyl methacrylate

Methyl parathion

Mevinphos

Maxcarbata

Monoethyl amine

Monomethyl amine

Naled

Napthenic acid

Nitrotoluene

Parathion

Phenosulfonate

Phosgene

Propargite

Propylene oxide

Pyrethrins

Quinoline

Resorcinol

Strontium

Strychnine

Styrene

2,4,5-T (2,4,5-Trichlorophenoxy acetic acid)

TABLE V.—TOXIC POLLUTANTS AND HAZARDOUS SUBSTANCES REQUIRED TO BE IDENTIFIED BY EXISTING DISCHARGERS IF EXPECTED TO BE PRESENT—Continued

TDE (Tetrachlorodiphenylethane)
2,4,5-TP [2-(2,4,5-Trichlorophenoxy) propanoic acid]
Trichlorofan
Triethanolamine dodecylbenzenesulfonate
Triethylamine
Trimethylamine
Uranium
Vanadium
Vinyl acetate
Xylene
Xylenol
Zirconium

Addendum B

Notice of Intent (NOI) Form (an NOI will not appear in today's proposed permit but will be included in the final rule)

Addendum C

Notice of Termination (NOT) Form (an NOT will not appear in today's proposed permit but will be included in the final rule)

Addendum E

Basic Format for Environmental Assessment

This is the basic format for the Environmental Assessment prepared by EPA from the review of the applicant's Environmental Information Document (EID) required for new source NPDES permits. Comprehensive information should be provided for those items or issues that are affected; the greater the impact, the more detailed information needed. The EID should contain a brief statement addressing each item listed below, even if the item is not applicable. The statement should at least explain why the item is not applicable.

A. General Information

1. Name of applicant
2. Type of facility
3. Location of facility
4. Product manufactured

B. Description Summaries

1. Describe the proposed facility and construction activity
2. Describe all ancillary construction not directly involved with the production processes
3. Describe briefly the manufacturing processes and procedures
4. Describe the plant site, its history, and the general area

C. Environmental Concerns

1. Historical and Archeological (include a statement from the State Historical Preservation Officer)
2. Wetlands Protection and 100-year Floodplain Management (the Army Corps of Engineers must be contacted if any wetland area of floodplain is affected)
3. Agricultural Lands (a prime farmland statement from the Soil Conservation Service must be included)
4. Coastal Zone Management and Wild and Scenic Rivers
5. Endangered Species Protection and

Fish and Wildlife Protection (a statement from the U.S. Fish and Wildlife Service must be included)

6. Air, Water, and Land Issues: quality, effects, usage levels, municipal services used, discharges and emissions, runoff and wastewater control, geology and soils involved, land-use compatibility, solid and hazardous waste disposal, natural and man-made hazards involved.
7. Biota concerns: floral, faunal, aquatic resources, inventories, and effects
8. Community Infrastructures available and resulting effects: social, economic, health, safety, educational, recreational, housing, transportation, and road resources

Basic Environmental Information Document Guidelines for New Source Category Industries

I. General Information

A. Name of Applicant and Proposed Facility:

B. Description of Site and Location:

C. Description of Project, Product, and Process:

Addendum F

Section 313 Water Priority Chemicals

| CAS No. | Common name |
|-----------------|---|
| 75-07-0 | Acetaldehyde. |
| 107-02-8 | Acrolein. |
| 107-13-1 | Acrylonitrile. |
| 309-00-2 | Aldrin[1,4:5,8-Dimethanonaphthalene,1,2,3,4,10,10-hexachloro-1,4,4a,5,8,8a (1.alpha.,4.alpha.,4a.beta.,5.alpha.,8.alpha.,8a.beta.)-]. |
| 107-05-1 | Allyl Chloride. |
| 7429-90-5 | Aluminum (fume or dust). |
| 7664-41-7 | Ammonia. |
| 62-53-3 | Aniline. |
| 120-12-7 | Anthracene. |
| 7440-36-0 | Antimony. |
| 7647189 | Antimony pentachloride. |
| 28300745 | Antimony potassium tartrate. |
| 7789619 | Antimony tribromide. |
| 10025919 | Antimony trichloride. |

hexahydro-

| CAS No. | Common name |
|-----------|---|
| 7783564 | Antimony trifluoride. |
| 1309644 | Antimony trioxide. |
| 7440-38-2 | Arsenic. |
| 1303328 | Arsenic disulfide. |
| 1303282 | Arsenic pentoxide. |
| 7784341 | Arsenic trichloride. |
| 1327533 | Arsenic trioxide. |
| 1303339 | Arsenic trisulfide. |
| 1332-21-4 | Asbestos (friable). |
| 542621 | Barium cyanide. |
| 71-43-2 | Benzene. |
| 92-87-5 | Benzidine. |
| 100470 | Benzonitrile. |
| 100-44-7 | Benzyl chloride. |
| 7440-41-7 | Beryllium. |
| 7787475 | Beryllium chloride. |
| 7787497 | Beryllium fluoride. |
| 7787555 | Beryllium nitrate. |
| 111-44-4 | Bis(2-chloroethyl) ether. |
| 75-25-2 | Bromoform. |
| 74-83-9 | Bromomethane (Methyl bromide). |
| 85-68-7 | Butyl benzyl phthalate. |
| 7440-43-9 | Cadmium. |
| 543908 | Cadmium acetate. |
| 7789426 | Cadmium bromide. |
| 10108642 | Cadmium chloride. |
| 7778441 | Calcium arsenate. |
| 52740166 | Calcium arsenite. |
| 13765190 | Calcium chromate. |
| 592018 | Calcium cyanide. |
| 133-06-2 | Captan [1H-Isolindole-1,3(2H)-dione,3a,4,7,7a-tetrahydro-2-[(trichloromethyl)thio]-]. |
| 63-25-2 | Carbaryl [1-Naphthalenol, methylcarbamate]. |
| 75-15-0 | Carbon disulfide. |
| 56-23-5 | Carbon tetrachloride. |
| 57-74-9 | Chlordane [4,7-Methanoindan,1,2,4,5,6,7,8,8- octachloro-2,3,3a,4,7,7a-hexahydro-]. |
| 7782-50-5 | Chlorine. |
| 59-50-7 | 4-Chloro 3-methyl phenol <i>p</i> -Chloro- <i>m</i> -cresol. |
| 108-90-7 | Chlorobenzene. |
| 75-00-3 | Chloroethane (Ethyl chloride). |
| 67-66-3 | Chloroform. |
| 74-87-3 | Chloromethane (Methyl chloride). |
| 95-57-8 | 2-Chlorophenol. |
| 106-48-9 | 4-Chlorophenol. |
| 1066304 | Chromic acetate. |
| 11115745 | Chromic acid. |
| 10101538 | Chromic sulfate. |
| 7440-47-3 | Chromium. |
| 1308-14-1 | Chromium (Tri). |
| 10049055 | Chromous chloride. |
| 7789437 | Cobaltous bromide. |
| 544183 | Cobaltous formate. |
| 14017415 | Cobaltous sulfamate. |
| 7440-50-8 | Copper. |
| 108-39-4 | <i>m</i> -Cresol. |
| 9548-7 | <i>o</i> -Cresol. |
| 106-44-5 | <i>p</i> -Cresol. |
| 1319-77-3 | Cresol (mixed isomers). |
| 142712 | Cupric acetate. |
| 12002038 | Cupric acetoarsenite. |
| 7447394 | Cupric chloride. |
| 3251238 | Cupric nitrate. |
| 5893663 | Cupric oxalate. |
| 7758987 | Cupric sulfate. |
| 10380297 | Cupric sulfate, ammoniated. |
| 815827 | Cupric tartrate. |
| 57-12-5 | Cyanide. |
| 506774 | Cyanogen chloride. |
| 94-75-7 | 2,4-D [Acetic acid, (2,4-dichlorophenoxy)-]. |
| 106-93-4 | 1,2-Dibromoethane (Ethylene dibromide). |
| 84-74-2 | Dibutyl phthalate. |
| 95-50-1 | 1,2-Dichlorobenzene. |
| 541-73-1 | 1,3-Dichlorobenzene. |
| 106-46-7 | 1,4-Dichlorobenzene. |
| 91-94-1 | 3,3'-Dichlorobenzidine. |

| CAS No. | Common name |
|-----------|--|
| 75-27-4 | Dichlorobromomethane. |
| 107-06-2 | 1,2-Dichloroethane (Ethylene dichloride). |
| 540-59-0 | 1,2-Dichloroethylene. |
| 120-83-2 | 2,4-Dichlorophenol. |
| 78-87-5 | 1,2-Dichloropropane. |
| 542-75-6 | 1,3-Dichloropropylene. |
| 62-73-7 | Dichlorvos [Phosphoric acid, 2,2-dichloroethenyl dimethyl ester]. |
| 115-32-2 | Dicofol [Benzenemethanol, 4-chloro-.alpha.-(4-chlorophenyl)-.alpha.-(trichloromethyl)-]. |
| 177-81-7 | Di-(2-ethylhexyl) phthalate (DEHP). |
| 84-66-2 | Diethyl phthalate. |
| 105-67-9 | 2,4-Dimethylphenol. |
| 131-11-3 | Dimethyl phthalate. |
| 534-52-1 | 4,6-Dinitro-o-cresol. |
| 51-28-5 | 2,4-Dinitrophenol. |
| 121-14-2 | 2,4-Dinitrotoluene. |
| 606-20-2 | 2,6-Dinitrotoluene. |
| 117-84-0 | n-Dioctyl phthalate. |
| 122-66-7 | 1,2-Diphenylhydrazine (Hydrazobenzene). |
| 106-89-8 | Epichlorohydrin. |
| 100-41-4 | Ethylbenzene. |
| 106934 | Ethylene dibromide. |
| 50-00-0 | Formaldehyde. |
| 76-44-8 | Heptachlor [1,4,5,6,7,8,8-Heptachloro-3a,4,7,7a-tetrahydro-4,7-methano-1H-indene]. |
| 118-74-1 | Hexachlorobenzene. |
| 87-68-3 | Hexachloro-1,3-butadiene. |
| 77-47-4 | Hexachlorocyclopentadiene. |
| 67-72-1 | Hexachloroethane. |
| 7647-01-0 | Hydrochloric acid. |
| 74-90-8 | Hydrogen cyanide. |
| 7664-39-3 | Hydrogen fluoride. |
| 7439-92-1 | Lead. |
| 301042 | Lead acetate. |
| 7784409 | Lead arsenate. |
| 7645252 | Lead arsenate. |
| 10102484 | Lead arsenate. |
| 7758954 | Lead chloride. |
| 13814965 | Lead fluoborate. |
| 7783462 | Lead fluoride. |
| 10101630 | Lead iodide. |
| 10099748 | Lead nitrate. |
| 7428480 | Lead stearate. |
| 1072351 | Lead arsenate. |
| 52652592 | Lead arsenate. |
| 7446142 | Lead sulfate. |
| 1314870 | Lead sulfide. |
| 592870 | Lead thiocyanate. |
| 58-89-9 | Lindane [Cyclohexane, 1,2,3,4,5,6-hexachloro-(1.alpha.,3.beta.,4.alpha.,5.alpha.,6.beta.)-]. |
| 14307258 | Lithium chromate. |
| 108-31-6 | Maleic anhydride. |
| 592041 | Mercuric cyanide. |
| 10045940 | Mercuric nitrate. |
| 7783359 | Mercuric sulfate. |
| 592858 | Mercuric thiocyanate. |
| 7782867 | Mercurous nitrate. |
| 7439-97-6 | Mercury. |
| 72-43-5 | Methoxychlor [Benzene, 1,1'-(2,2,2-trichloroethylidene)bis[4-methoxy-]. |
| 80-62-6 | Methyl methacrylate. |
| 91-20-3 | Naphthalene. |
| 7440-02-0 | Nickel. |
| 15699180 | Nickel ammonium sulfate. |
| 37211055 | Nickel chloride. |
| 7718549 | Nickel chloride. |
| 12054487 | Nickel hydroxide. |
| 14216752 | Nickel nitrate. |

Addendum G**Region-Specific Permit Conditions****Region VI—Permits for Louisiana, New Mexico, Oklahoma, and Texas**

Unless otherwise specified, the following Region-specific permit requirements apply to the permits for Louisiana (LAR05*###), New Mexico (NMR05*###), Oklahoma (OKR05*###), Texas (TXR05*###), and Indian Lands in these states (LAR05*##F, NMR05*##F, OKR05*##F, or TXR05*##F). Language should be substituted or deleted as indicated.

Part I.B.3. Limitations on Coverage.
<Insert the following paragraph for the Oklahoma Permit—OKR05*###>

f. Discharges to Oklahoma Outstanding Resource Waters and Scenic Rivers. "New" point source discharges of storm water associated with industrial activity (those commencing after the June 25, 1992, effective date of the Oklahoma Water Quality Standards—Oklahoma Annotated Code Title 785, Chapter 45) to the following waters:

(1) waterbodies designated as "Outstanding Resource Waters" and/or "Scenic Rivers" in Appendix A of the Oklahoma Water Quality Standards;

(2) Oklahoma waterbodies located within the watersheds of waterbodies designated as "Scenic Rivers" in Appendix A of the Oklahoma Water Quality Standards; and

(3) waterbodies located within the boundaries of Oklahoma Water Quality Standards Appendix B areas which are specifically designated as "Outstanding Resource Waters" in Appendix A of the Oklahoma Water Quality Standards.

Part XI.J. Storm Water Discharges Associated With Industrial Activity From Mineral Mining and Processing Facilities

1. Discharges Covered Under This Section <The following paragraphs replace or are in addition to the

corresponding paragraphs of the generic permit language.>

b. Limitations on Coverage. The following storm water discharges associated with industrial activity are not authorized by this permit:

(1) Storm water discharges associated with industrial activity which are subject to an existing effluent limitation guideline, except for mine dewatering discharges subject to 40 CFR Part 436, Subparts B, C, and D which are composed of storm water or groundwater seepage only.

4. Numeric Effluent Limitations. In addition to the numeric effluent limitations described by Part V., the following effluent limitations shall be met by existing and new mine dewatering discharges composed entirely of storm water or groundwater seepage from Crushed Stone, Construction Sand and Gravel, and Industrial Sand mines. The provisions of this paragraph are applicable to mine dewatering discharges from the Crushed Stone, Construction Sand and Gravel, and Industrial Sand Subcategories of the Mineral Mining and Processing Point Source Categories (40 CFR 436.20, 436.30 and 436.40) where the discharge is composed entirely of storm water or groundwater seepage. The concentration of pollutants in storm water or mined watering discharges shall not exceed the following effluent limitations:

| Effluent characteristics | Effluent limitations (mg/L) | |
|------------------------------|------------------------------|--|
| | Maximum for any 1 day | Average of daily values for 30 consecutive days shall not exceed |
| Total Suspended Solids (TSS) | 45 mg/L | 25 mg/L. |
| pH | Within the range 6.0 to 9.0. | Within the range 6.0 to 9.0. |

However, if a mine is also used for treatment of process generated waste water, discharges of commingled water from the mine shall be deemed discharges of process generated waste water and this permit does not authorize its discharge. Discharges of storm water commingled with process wastewater must be permitted by a separate NPDES process wastewater discharge permit.

5. Monitoring and Reporting Requirements

a. Monitoring Requirements

(2) Mine Dewatering Discharges from Crushed Stone, Construction Sand and Gravel, and Industrial Sand Mines. During the period beginning on the effective date and lasting through the expiration date of this permit, all Crushed Stone, Construction Sand and Gravel, and Industrial Sand mining facilities will be required to conduct monitoring for their mine dewatering discharges as specified below:

| Parameter | Unit | Frequency | Sample Type |
|-------------------------|------------|-----------|-------------|
| Total Flow. | MG | Quarterly | Estimate. |
| pH | s.u. | Quarterly | Grab. |
| Total Suspended Solids. | mg/L | Quarterly | Grab. |

Food and Drug Administration

21 CFR Part 20

**Public Information; Communications With
Foreign Government Officials; Rule**

**DEPARTMENT OF HEALTH AND
HUMAN SERVICES**
Food and Drug Administration
21 CFR Part 20
[Docket No. 92N-0072]
**Public Information; Communications
With Foreign Government Officials**
AGENCY: Food and Drug Administration, HHS.

ACTION: Final rule.

SUMMARY: The Food and Drug Administration (FDA) is issuing a final rule amending the regulation governing communications with foreign government officials. This final rule allows the agency to disclose nonpublic safety, effectiveness, or quality information concerning FDA regulated products to foreign government officials who perform counterpart functions without compelling the public disclosure of such information. On June 26, 1992, FDA issued a proposed rule on this subject and invited public comments. This final rule retains and strengthens the requirements set forth in the proposal to protect the confidentiality of the information that is shared. FDA invites interested persons to submit additional comments on the final rule and to suggest changes that would further the agency's public health protection mission through improved sharing of information with foreign government officials.

DATES: This rule becomes effective December 20, 1993. Written comments by March 21, 1994.

ADDRESSES: Submit written comments to the Dockets Management Branch (HFA-305), Food and Drug Administration, rm. 1-23, 12420 Parklawn Dr., Rockville, MD 20857.

FOR FURTHER INFORMATION CONTACT: Edwin V. Dutra, Jr., Regulations Policy and Management Staff (HF-26), Food and Drug Administration, 5600 Fishers Lane, Rockville, MD 20857, 301-443-3480.

SUPPLEMENTARY INFORMATION:
I. Background

The existing regulation governing the exchange of information between FDA and foreign government officials in § 20.89 *Communications with foreign government officials* (21 CFR 20.89), provides that FDA may receive confidential commercial information from foreign government officials who perform counterpart functions to FDA and that such information will be exempt from public disclosure.

However, under the existing regulation, the agency may not provide such information in its own files to foreign government counterparts even when there is a domestic or global public health need and even when the foreign government offers assurances that the information will be protected from further disclosure.

In the Federal Register of June 26, 1992 (57 FR 28648), FDA published a notice of proposed rulemaking to enhance communications with foreign government officials and remove restrictions on international cooperation on new product review and approval. Interested persons were invited to submit written comments by August 25, 1992. In the Federal Register of August 14, 1992 (57 FR 36617), FDA extended the period for submission of comments to September 24, 1992, in response to a request for an extension of the comment period. A total of 22 written comments were received. The comments were from the following sources: 15 were from manufacturers, 3 were from foreign governments, 3 were from manufacturers' associations, and 1 was from a law firm.

Many of the comments strongly supported FDA's efforts to harmonize international regulatory requirements, and several recognized the benefits in the United States, as well as in foreign countries, that may be derived from international cooperation on individual product reviews. However, many of the comments also expressed the view that the proposal contained inadequate safeguards to prevent redisclosures of proprietary information.

After review and consideration of all comments, FDA continues to believe that the agency will be better able to accomplish its public health mission if it may, under certain circumstances, share with foreign government counterparts nonpublic data provided by sponsors, expert evaluations by FDA reviewing scientists, and confidential commercial information contained in investigatory records. Therefore, FDA is now amending § 20.89. In response to the comments received, the agency has described more explicitly the safeguards that apply to authorized disclosures of confidential information to foreign government officials.

The amended rule will facilitate approval-related decision-making on FDA regulated articles, and it is expected to be of greatest value in expediting the review of products intended to diagnose or treat serious or life-threatening diseases.

This final rule amending § 20.89 does not change the existing regulatory authority for the agency to disclose to

foreign government officials investigatory records compiled for law enforcement purposes.

FDA invites comments on this final rule and on other issues surrounding the disclosure to foreign government officials of nonpublic information that would be important to global public health or to further harmonization of regulatory requirements. The agency recognizes that there are numerous situations where public health interests, both domestic and global, would be better served if the agency could disclose other types of predecisional documents (e.g., draft health hazard alerts or draft regulations) to foreign government officials without invoking the requirement in § 20.21 *Uniform access to records* (21 CFR 20.21). Disclosures of predecisional documents might be limited to announcements of health hazards or to situations where FDA and a foreign counterpart have in place, or are negotiating, an agreement such as a memorandum of understanding, or where the other country is a partner with the United States under free trade agreements.

This final rule amending § 20.89 does not address these broader information disclosure issues encountered in efforts to harmonize regulatory approaches or to cooperate in addressing global public health matters. These other international information disclosure issues may be the subject of future regulatory proposals. The agency is now soliciting comments to help guide the future rulemaking.

FDA's regulations governing public information in part 20 (21 CFR part 20) implement the Freedom of Information Act (FOIA), 5 U.S.C. 552, and other laws that affect public access to government records and information (e.g., 18 U.S.C. 1905 and 21 U.S.C. 331(j)). Section 20.21 of FDA's regulations implementing these laws provides a general rule that any record of the agency that is disclosed in an authorized manner to any member of the public is available for disclosure to all members of the public. In general, communications with foreign government officials currently have the same status as communications with any member of the public. For this reason, and in accordance with FDA's rule on uniform access (§ 20.21), the disclosure of agency records to foreign government officials ordinarily constitutes disclosure to the public and obligates FDA to make the same records available to any person who requests them under the FOIA.

Subpart E of part 20 identifies several categories of people or institutions to whom disclosure of FDA records may be

made without requiring uniform access under § 20.21. One such category consists of foreign government officials who perform counterpart functions to FDA in a foreign country (§ 20.89). Under § 20.89(a), however, although confidential commercial information obtained by such officials and voluntarily disclosed to FDA as part of cooperative law enforcement and regulatory efforts is protected from disclosure under § 20.61 *Trade secrets and commercial or financial information which is privileged or confidential* (21 CFR 20.61), FDA may not disclose to those officials confidential commercial information submitted to, or incorporated into, records prepared by FDA. Under current regulations, disclosure of such information by FDA would invoke the requirement in § 20.21 of uniform access to records.

In 1974, when FDA promulgated the public information regulations now codified at part 20, the agency considered the exchange of confidential commercial information with foreign governments and decided not to make such an exchange an exception to § 20.21.

* * * Foreign governments have discussed with the Food and Drug Administration the possibility of exchanging data and information on the safety and effectiveness of investigational and marketed drugs.

The Commissioner concludes that the same rules will apply with respect to disclosure of such information to foreign governments as apply to disclosure to the public. This will permit the Food and Drug Administration to provide full summaries of all safety and effectiveness data for all approved NDA's and selected summaries for IND's and pending NDA's of which the existence of an IND has been publicly disclosed or acknowledged. The Commissioner concludes that this will adequately satisfy the need for international exchange of important regulatory information of this type.

(39 FR 44602 at 44636, December 24, 1974).

This rulemaking was undertaken because of FDA's conclusion that its inability under the public information regulations to disclose to foreign government officials confidential commercial information submitted to FDA or incorporated into agency-prepared records is impeding its efforts to meet the current need for international exchange of important regulatory information.

Changed circumstances since 1974 make the restrictions in current § 20.89 undesirable. In the 19 years that have passed since FDA promulgated § 20.89, agency scientists have become increasingly aware of the benefits to consumers in the United States, as well

as in foreign countries, of not only reviewing data in the files of foreign government officials, but also sharing with counterpart foreign government officials the results of FDA's scientific evaluations and its investigative activities relating to products that have been or are intended to be manufactured and marketed throughout the world. In addition, increasing harmonization of technical product approval standards throughout the world has diminished earlier differences between the approval processes of various countries and the United States. Furthermore, growing numbers of clinical trials undertaken to support product approval applications in the United States are now conducted in foreign countries as well as in the United States.

Cooperative efforts with government scientists in other countries are particularly important to comprehensive and timely review of products that are being developed to diagnose, cure, mitigate, treat, or prevent life-threatening illnesses. In the case of didanosine (ddI), for example, a drug intended for use in the treatment of acquired immunodeficiency syndrome (AIDS), FDA and its Canadian counterparts received simultaneous submissions of marketing applications from the sponsor, Bristol-Myers Squibb. Thereafter, a joint review by Canadian and FDA authorities facilitated the expeditious approval of the drug. In order to accomplish this joint review in accordance with the current public information regulations, a variety of cumbersome arrangements were undertaken to ensure that the data in the application did not become subject to inappropriate public disclosure. One of the purposes of amending § 20.89 is to clarify and standardize the arrangements needed each time the review of a product stands to benefit from cooperative review by FDA scientists and foreign government counterparts, whether that review is in the context of approving a product, finding that a product is nonapprovable, or withdrawing approval of an already marketed product.

II. Analysis of Comments on the Proposed Rule

1. Several comments from manufacturers suggested that information could best be submitted directly by the firm or individual to the foreign government.

FDA points out that, in the typical case, the foreign government already has the nonpublic information in its files. However, one achievement of this rulemaking is the ability to share and consult on agency-prepared records

(e.g., draft and final evaluations by FDA review scientists) that incorporate or refer to nonpublic confidential commercial information. The firm would not be in a position to submit to the foreign government such evaluations by FDA scientists.

2. Comments also asserted that the original proposal was overbroad and unnecessary, and might actually impede approvals.

The agency never intended disclosure to foreign government officials to be a routine occurrence. FDA believes that the preamble to the original proposal made clear that the agency intends to engage in the nonpublic exchange of confidential commercial information with foreign counterparts only when certain conditions are met. In every case, assurances must be provided by the foreign agency that the information will be held in confidence. The final rule expressly establishes that, in addition, before such confidential exchanges may occur, there must be either authorization by the sponsor or a regulatory benefit to FDA in its own review of products or implementation of its mission.

Thus, in addition to foreign governmental confidentiality assurances, any one of three additional conditions must be met: (a) Written authorization by the submitter of the information; (b) a finding that disclosure is in the interest of public health by reason of the foreign government's possessing information concerning the safety, efficacy, or quality of the product or information concerning an investigation; or (c) the disclosure is to a foreign scientist visiting FDA as part of a joint review or long-term cooperative training effort that furthers FDA's regulatory mission.

The first condition provides the mechanism by which the submitter of information authorizes its disclosure to the foreign government. The second condition provides an enhancement of FDA review functions through facilitating consultation with foreign government officials who already are in possession of relevant information on the subject and can contribute to FDA's evaluation. The third condition makes explicit in § 20.89 a longstanding implementation of section 708 of the Federal Food, Drug, and Cosmetic Act (the act) (21 U.S.C. 379) and § 20.90 *Disclosure to contractors* (21 CFR 20.90) in the human drugs and biologics regulatory programs. This criterion also clarifies that there is no need to compel visiting foreign officials to become special Government employees of the United States, as long as specified safeguards concerning physical security,

confidentiality, and financial conflict of interest are met.

FDA emphasizes that the agency will deny requests to share information with officials of foreign governments that lack scientific data or regulatory expertise to contribute to a product review or laboratory or clinical investigation unless the foreign government intends to use the information for law enforcement purposes. Furthermore, under all circumstances, and regardless of the information and expertise in the possession of a foreign government official, the decision to share information is a discretionary one that FDA will make on a case-by-case basis. The disclosure of confidential commercial information to foreign government officials will be administered by designated officials in FDA's respective centers.

In reviewing comments stating that FDA's proposal to amend § 20.89 was unnecessary, agency scientists and investigators provided the following examples of situations in which the ability to share confidential commercial information with foreign governments would have allowed more timely review of significant product applications subject to FDA approval or would have enhanced effective regulatory activities:

a. FDA's centers reported that the current restrictions on disclosure to foreign government authorities have limited the centers' ability to communicate with other countries about adverse effects reports for regulated products.

b. FDA's Center for Veterinary Medicine believes that the current restrictions have hampered investigations of counterfeit bulk animal drugs in international commerce. Although investigatory records related to counterfeiting compiled for law enforcement purposes can be exchanged with foreign government counterparts and protected under the current terms of § 20.89, scientific information concerning the authentic products is often confidential commercial data that cannot be disclosed to foreign governments without triggering the uniform disclosure provision of FDA's public information regulations. The ability to share such information is important to FDA's scientific review and surveillance activities that may precede law enforcement efforts and, in particular, to the development of international profiles for those authentic products that are the object of counterfeiting.

c. The approval times in Europe and in the United States for the therapeutic biological products Neupogen and

Proleukin varied significantly because of constraints on sharing data across national boundaries.

d. FDA's Center for Devices and Radiological Health was constrained from sharing confidential commercial information in product applications and inspection reports with foreign government officials during the FDA's call for data on silicone gel-filled breast implants and during the moratorium on the sale and use of those products in this country. Enhanced ability to share information with other governments would have enabled the public health aspects of FDA's actions to be better understood in other countries, and would have eliminated some of the public health concerns and consumer confusion that resulted from inconsistent regulation of these products by different national authorities.

3. A number of comments suggested that definitions of "confidential commercial" and "trade secret" be included in the regulation.

The agency believes that encumbering this regulation with lengthy definitions of trade secret or confidential commercial information is unnecessary. As they are relevant to disclosure of information contained in agency records, those terms have been defined by Federal statute, judicial opinions, and agency practice over many years. The proposal to amend § 20.89 set forth a detailed discussion of the way the agency has in the past, and intends to continue, to interpret these terms. That discussion is being expanded in this document.

Trade secret information has been defined by the courts as information relating to the making, preparing, compounding, or processing of trade commodities (*Public Citizen Health Research Group v. FDA*, 704 F.2d 1280, 1288 (D.C. Cir. 1983)). This definition, which requires a "direct relationship" between the trade secret and the productive process, applies to a relatively narrow category of information that coincides with information prohibited from disclosure by section 301(j) of the act (21 U.S.C. 331(j)). The agency is aware that the definition of "trade secret" promulgated in § 20.61(a) in the 1970's is a broader and more inclusive one. Section 20.61(a), however, has since been narrowed by judicial opinions interpreting the FOIA (see *Public Citizen Health Research Group v. FDA; Anderson v. HHS*, 907 F.2d 936, 944 (10th Cir. 1990)), and FDA is in the process of amending § 20.61 to reflect the current legal scope of the trade secret definition. That amendment to

§ 20.61 is part of an update of the FOIA regulations that reflects changes that were required by the 1986 amendments to the FOIA and which have already been put into practice by the agency.

The amended definition of "trade secret" that will be published in FDA's updating of its part 20 regulations is a restatement of the standard established by *Public Citizen*, and will put the definition in conformity with applicable case law and with the Department of Health and Human Services' FOIA regulations. Because FDA's practice has been in accordance with the judicial standards that resulted from *Public Citizen*, and the definitions promulgated by the Department, the amendment to § 20.61 will not alter the agency's practice in any way or the expectations the public and regulated industry have concerning FDA's treatment of particular types of information.

In any case, the present amendment to § 20.89 does not alter FDA's practice with respect to the narrow category of information that can be considered "trade secret" because, except as discussed below, the proposed amendment to § 20.89 expressly excludes the exchange of information that would fall into that category to foreign officials outside FDA, without the express authorization of the submitter of the information.

The focus of this rulemaking is the sharing of "confidential commercial information," agency-prepared reviews of such information, and investigatory records that include such information. The focus of this rulemaking is not on the nonpublic exchange of trade secret information, the other category of information covered by exemption 4 of the FOIA. The sharing of confidential information, including trade secret information, with visiting foreign scientists insofar as that access is authorized under confidentiality agreements for a training or joint review activity pursuant to section 708 of the act and § 20.90 has been a longstanding agency practice. This final rule (§ 20.89(c)(1)(ii)(C)) codifies the procedures for providing access to such information in the rule on sharing information with foreign officials rather than continuing this practice in the more general § 20.90 procedures.

Commercial or financial information that a person is required to provide FDA is "confidential" for purposes of exemption 4 if disclosure of the information is likely to (1) impair the Government's ability to obtain necessary information in the future or (2) cause substantial harm to the competitive position of the person from whom the information was obtained. (See *Critical*

Mass Energy Project v. NRC, 975 F.2d 871, 877-880 (D.C. Cir. 1992) (en banc), cert. denied, 113 S.Ct. 1579 (1993); *National Parks & Conservation Ass'n v. Morton*, 498 F.2d 765, 770 (D.C. Cir. 1974)). Commercial or financial information that is provided to FDA on a voluntary basis is "confidential" if it is of a kind that the provider would not customarily release to the public. (See *Critical Mass* at 880.) The types of information that may be exempt from public disclosure pursuant to this section of the FOIA include: Business sales statistics, customer and supplier lists, research data, profit and loss data, and overhead and operating costs. Under many circumstances, FDA treats data supporting product approval applications as confidential commercial information that is entitled to be protected from public disclosure. Thus, under the amended regulation, confidential commercial information submitted to the agency that could be shared with foreign governments would include: Information (other than trade secret information protected from disclosure under section 301(j) of the act) in pending and approved applications for permission to perform studies on or to market regulated articles, such as new drugs, new animal drugs, medical devices, biological products, and food or color additives, and information in agency-prepared reviews of such applications.

FDA has taken the position in the past that it has authority to share confidential commercial information in records compiled for law enforcement purposes by FDA with foreign government officials who perform counterpart functions to FDA in a foreign country as part of cooperative law enforcement efforts. § 20.89(b). Such disclosure does not invoke the uniform access rule established by § 20.21. FDA believes that, after this final rule amends § 20.89, the agency, in its discretion and subject to the conditions imposed by this amended rule, will be able to share confidential commercial information (whether provided by sponsor or found in investigatory records) with foreign governments for use in foreign government regulatory efforts or in cooperative law enforcement efforts. After this rule is amended, FDA will be able to share with foreign governments confidential commercial information contained in applications, in agency-prepared reviews of such applications, and in agency-prepared investigatory records without invoking the rule established in § 20.21.

4. Five comments argued that the June 26, 1992 proposal would violate

provisions of the Freedom of Information Act and the Trade Secrets Act. Some also suggested it was contrary to the intent of Congress and traditional FDA policy on new product innovation.

FDA disagrees with the view that it is contrary to law to disclose confidential commercial information to counterpart foreign officials under the conditions set forth in this final rule amending § 20.89.

In the first place, any disclosure pursuant to the amended regulation would not be a public disclosure. Under all circumstances, the disclosure will be on a case-by-case basis to foreign government officials under assurances of continuing confidentiality. Furthermore, the amendment establishes that FDA will not treat any disclosure made under the conditions set forth in the regulation as a public disclosure that will trigger availability of the information to a FOIA requester.

Second, it is the intention and expectation of the agency that, in most circumstances, disclosure will be made with the written authorization of the submitter of the information. FDA will consider such written authorization, once granted by the submitter for specified information, to be irrevocable for that information. FDA believes that, in most cases, sponsors will authorize these disclosures because the exchange of information is likely to facilitate review of product applications in both countries. After all, if a sponsor's product is under review in two countries, the sponsor benefits from expedited decisions that can result when reviewers can communicate with each other on confidential commercial information.

The final rule specifically references permission of the sponsor as a precondition for disclosure, except where there is a finding by the agency that disclosure is in the interest of public health by reason of the foreign government's possessing information concerning the safety, efficacy, or quality of the product or information concerning an investigation, or the disclosure is to a visiting foreign official as part of a joint review or long-term cooperative training effort, where the individual is subjected to conflict of interest safeguards and provides a written assurance of confidentiality, and the information is retained on FDA premises where document security precautions are in place.

There are situations in which it might be inappropriate to seek a sponsor's consent. For example, if communications and consultation with the submitters of the information have not resolved agency concerns, there may be circumstances in which FDA

reviewers and investigators will wish to consult with foreign government counterparts who are in the possession of similar submissions by the sponsor. It may even be that, during the course of an application review, FDA employees may discover problems with studies that raise the possibility that a sponsor or his employee had engaged in deliberate fraud or misrepresentation. Similarly, there are circumstances in which FDA investigators may wish to share with foreign counterparts confidential commercial information obtained through an FDA investigation for the foreign counterparts' use in their own regulatory efforts. This could include, for example, information in an open investigation concerning customer-supplier relationships or marketing plans. This type of information is customarily held in close confidence by businesses and therefore usually protected from public disclosure by FDA in response to a FOIA request. Disclosure of this information to foreign government counterparts, however, may facilitate efforts to keep unapproved, adulterated, counterfeit, or misbranded products off world markets as well as American markets.

As the agency stated in the proposal to amend § 20.89, a disclosure to foreign officials pursuant to § 20.89 would be an "authorized" disclosure, and thus no FDA employee engaged in such a nonpublic exchange of confidential commercial information would be in violation of 18 U.S.C. 1905 (the Trade Secrets Act). That statute makes it a crime for a Federal employee to make an unauthorized disclosure of certain types of business and financial information.

5. Several comments stated that an amendment to § 20.89 would not provide legal "authorization" to prevent violation of the Trade Secrets Act because such authorization must be based on specific statutory authority.

The agency disagrees with this view. In the first place, as discussed above, the agency believes that this limited nonpublic exchange of information with foreign government counterparts does not constitute a public disclosure prohibited by the Trade Secrets Act. Second, the agency believes that a variety of provisions of the Act, as well as other statutes enforced by the agency, provide authority for such a regulation. Sections 701 and 903 of the Act (21 U.S.C. 371 and 393), e.g., give the Commissioner of Food and Drugs authority to promulgate regulations that will allow for the efficient enforcement of the Act, including determining if applicants meet approval criteria for products and protecting the public from adulterated or misbranded products,

and responsibility for research relating to food, drugs, cosmetics, and devices. Section 708 of the Act (21 U.S.C. 379) specifically authorizes sharing of nonpublic information under contractual arrangements that include security precautions. This provision has previously been implemented in § 20.90 and also forms a legal basis for § 20.89 as now amended. In implementing § 20.89, with respect to foreign visiting scientists, the agency will implement safeguards that include security precautions similar to those in place under § 20.90. A disclosure by FDA of trade secrets to visiting foreign scientists, pursuant to section 708 of the Act as implemented in the amended rule with its strict safeguards, would not violate either section 301(j) of the Act or the Trade Secrets Act.

In addition, sections 301 and 307 of the Public Health Service Act (42 U.S.C. 241 and 2421), which set forth certain general powers and duties of the Secretary of Health and Human Services, also authorize this regulation. Section 301 gives the agency a mandate to encourage, cooperate, and render assistance to other appropriate public authorities, including making available through appropriate means information relating to research and investigation. Section 307 establishes a responsibility to participate with other countries in cooperative endeavors that may advance the health of the American people. These general grants of authority, in combination with specific sections of the statutes enforced by FDA, e.g., section 301 of the Act (21 U.S.C. 331), prohibiting, *inter alia*, the introduction of adulterated or misbranded products into commerce between any State or Territory and any place outside that State or Territory, provide ample authorization for the promulgation of the proposed amendment to § 20.89. Finally, it should be reemphasized that this rulemaking does not affect the prohibition on disclosure of trade secret information protected by 21 U.S.C. 331(j) and in fact it contains an express provision excluding such information, except where disclosure is authorized under section 708 of the Act.

6. Nine comments stated that sponsors should have an opportunity to review information to be shared with foreign officials, and five said any disclosure of confidential commercial information should be made only with the consent of the sponsor.

The agency believes that, in most situations in which information sharing is contemplated, the written consent of sponsors should and will be obtained. As explained above, in the majority of cases, the cooperative exchange of

nonpublic information with foreign government scientists will benefit individual companies as well as the public health, by permitting more timely review of pending product applications in both countries. These are situations in which sponsors would willingly consent to the limited disclosures the regulation permits. However, as discussed earlier, FDA also anticipates that regulatory activity may precede law enforcement situations requiring the disclosure of confidential commercial information, and in these cases it might be inappropriate for FDA to seek a sponsor's consent.

Also, as noted above, the final rule codifies longstanding FDA implementation of section 708 of the Act and § 21.90 with respect to cooperative training activities involving visiting foreign scientists on FDA premises in which FDA requires that such officials sign confidentiality agreements to assure that they do not disclose any nonpublic information to which they are exposed as part of their training, which may include product review activities. FDA is unaware of the occurrence of any inappropriate disclosures by individuals involved in these highly successful activities and FDA is codifying these procedures in § 20.89. The safeguards applicable to visiting foreign scientists have been continued, and FDA has strengthened them by applying certain conflict of interest prohibitions to such officials.

7. Several comments expressed concern about any further disclosure of confidential commercial information by foreign governments, based on the written permission of FDA. One comment suggested that there should be no authorization at all for further disclosure, and three comments argued that only the sponsor should be able to permit further disclosure.

FDA agrees that, in general, the sponsor needs to authorize further disclosure of confidential information. However, the agency recognizes that sponsors frequently release information concerning product applications, thereby placing such information in the public domain. There is also the possibility that information once protected from public disclosure may become legally available under FDA's FOIA regulations at some point in time. For example, summary basis of approval documents, including reviews by agency scientists, would not be available to a FOIA requester before the sponsor of a new drug application receives an approval letter from FDA. However, these summaries lose their confidential status under the agency's

regulations once the application is approved. (See 21 CFR 314.430.)

In order to clarify the intent of the proposal, the final rule provides for further disclosure by the foreign government only upon receipt of the written permission of the sponsor or written confirmation by FDA that the information no longer has confidential status.

8. Several comments urged that more explicit conditions be established for the sharing of information with foreign counterparts. One comment suggested that confidential commercial information be shared only with countries with similar product approval processes. Another suggested that FDA establish lists of foreign governments that have been designated as appropriate for the sharing of confidential information. One comment expressed concern that foreign agency requests might be listed in a publicly available log.

With respect to publicly available information, FDA does not include in its FOIA log the information requests the agency receives from foreign governments. FDA views any sharing of confidential commercial information with foreign government officials as an activity that must be carried out in a confidential manner and believes that listing in a public log would be inappropriate.

FDA does not believe a list of countries that have been designated acceptable for such information exchanges would be useful. As discussed above, the exchange of information with foreign government officials will be authorized on a case-by-case basis. Although the conditions set forth in the amendment must be met before any disclosure will occur, in every case disclosure is at the discretion of the agency and cannot be automatic for any country.

With respect to the information that would be the subject of the exchange, FDA believes that concerns about continued protection of this information are adequately addressed by the foreign government's written statement of authority to protect confidential commercial information from public disclosure and its commitment not to further disclose the information except with the sponsor's permission or FDA's confirmation that the information no longer needs to be treated as confidential. In order to address concerns about the protection of such information, however, new language in the revised regulation would require, prior to the sharing of any information, either a sponsor's authorization for the disclosure or a finding by FDA that the

foreign government possesses information concerning the safety, efficacy, or quality of a product or concerning an investigation. As discussed above in response to comment 6 of section II of this document, other strict safeguards apply to visiting foreign scientists on FDA's premises.

9. Several comments suggested that FDA should require the posting of bonds, establish penalties for foreign governments that do not preserve confidentiality, or bar governments that do not protect information from receiving information in the future. One comment stated that there is no practical remedy to deal with unauthorized further disclosure.

Although FDA appreciates the difficulties of finding a practical remedy for the sponsor whose information has been the subject of an unauthorized disclosure, the agency is committed to whatever actions are appropriate. FDA is unlikely to undertake further cooperative ventures with governments that fail to live up to their written commitments.

III. The Amended Regulation

In summary, in order to facilitate the approval of products that are shown to be safe and effective, to expedite the withdrawal of approval of products that are found not to be safe and effective, and to enhance the efficiency of its enforcement efforts, FDA is issuing this final rule to amend § 20.89 to permit disclosure to foreign government officials, in the circumstances in the rule, of confidential commercial information submitted to FDA or incorporated into agency-prepared records. The Commissioner, or his or her designee, would be authorized to disclose the information after making appropriate determinations as to safeguards of confidentiality.

The amended regulation would not permit the disclosure of trade secret information that relates to manufacturing methods and processes and is entitled to protection under section 301(j) of the act, except as authorized under section 708 of the act. Circumstances might arise, however, when FDA determines that the exchange of information relating to manufacturing methods and processes would enhance the agency's ability to review an application for product approval or clinical investigation, or examine regulatory issues that have arisen with respect to a marketed product or one that is under investigation. In such circumstances, FDA would seek the permission of the submitter of the trade secret information prior to disclosing

that information to foreign government officials in foreign countries.

IV. Environmental Impact

The agency has determined under 21 CFR 25.24(a)(8) that this action is of a type that does not individually or cumulatively have a significant effect on the human environment. Therefore, neither an environmental assessment nor an environmental impact statement is required.

V. Economic Impact

In accordance with Executive Order 12866, FDA has carefully analyzed the economic effects of this final rule and has determined that this final rule is not a significant regulatory action as defined by the order. FDA, in accordance with the Regulatory Flexibility Act, has considered the effect that this final rule has on small entities, including small businesses, and has determined that no significant impact on a substantial number of small entities would derive from this action.

VI. Effective Date

This rule becomes effective December 20, 1993.

VII. Comments

Interested persons may, on or before March 21, 1994 submit to the Dockets Management Branch (address above) written comments regarding this rule or other issues involving disclosure of information to foreign government officials for broader purposes, such as cooperation on global public health issues and harmonization of regulatory requirements. Two copies of any comments are to be submitted, except that individuals may submit one copy. Comments are to be identified with the docket number found in brackets in the heading of this document. Received comments may be seen in the office above between 9 a.m. to 4 p.m., Monday through Friday.

List of Subjects in 21 CFR Part 20

Confidential business information, Courts, Freedom of information, Government employees.

Therefore, under the Federal Food, Drug, and Cosmetic Act and under authority delegated to the Commissioner of Food and Drugs, 21 CFR part 20 is amended as follows:

PART 20—PUBLIC INFORMATION

1. The authority citation of 21 CFR part 20 continues to read as follows:

Authority: Secs. 201–903 of the Federal Food, Drug, and Cosmetic Act (21 U.S.C. 321–393); secs. 301, 302, 303, 307, 310, 311, 351, 352, 354–360F, 361, 362, 1701–1706,

2101 of the Public Health Service Act (42 U.S.C. 241, 242, 242a, 242l, 242n, 243, 262, 263, 263b–263n, 264, 265, 300u–300u–5, 300aa–1); 5 U.S.C. 552; 18 U.S.C. 1905.

2. Section 20.89 is amended by adding new paragraph (c) to read as follows:

§ 20.89 Communications with foreign government officials.

* * * * *

(c)(1) The Commissioner of Food and Drugs, or any other officer or employee of the Food and Drug Administration whom the Commissioner may designate to act on his or her behalf for the purpose, may authorize the disclosure of confidential commercial information submitted to the Food and Drug Administration, or incorporated into agency-prepared records, to foreign government officials who perform counterpart functions to the Food and Drug Administration as part of cooperative law enforcement or regulatory efforts, provided that:

(i) The foreign government agency has provided both a written statement establishing its authority to protect confidential commercial information from public disclosure and a written commitment not to disclose any such information provided without the written permission of the sponsor or written confirmation by the Food and Drug Administration that the information no longer has confidential status; and

(ii) The Commissioner of Food and Drugs or the Commissioner's designee makes one or more of the following determinations:

(A) The sponsor of the product application has provided written authorization for the disclosure;

(B) Disclosure would be in the interest of public health by reason of the foreign government's possessing information concerning the safety, efficacy, or quality of a product or information concerning an investigation; or

(C) The disclosure is to a foreign scientist visiting the Food and Drug Administration on the agency's premises as part of a joint review or long-term cooperative training effort authorized under section 708 of the act, the review is in the interest of public health, the Food and Drug Administration retains physical control over the information, the Food and Drug Administration requires the visiting foreign scientist to sign a written commitment to protect the confidentiality of the information, and the scientist provides a written assurance that he or she has no financial interest in the regulated industry of the type that would preclude participation

in the review of the matter if the individual were subject to the conflict of interest rules applicable to the Food and Drug Administration advisory committee members under § 14.80(b)(1) of this chapter. Subject to all of the foregoing conditions, visiting foreign scientists may have access to trade secret information, entitled to protection under section 301(j) of the Federal Food, Drug, and Cosmetic Act (the act), in those cases where such disclosures would be a necessary part of the joint review or training.

(2) Except as provided under paragraph (c)(1)(ii)(C) of this section, this provision does not authorize the disclosure to foreign government officials of other countries of trade secret information concerning manufacturing methods and processes prohibited from disclosure by section 301(j) of the act, unless pursuant to an express written authorization provided by the submitter of the information.

(3) Any disclosure under this section of information submitted to the Food and Drug Administration or

incorporated into agency-prepared records does not invoke the rule established in § 20.21 that such records shall be made available to all members of the public.

Dated: November 15, 1993.

Michael R. Taylor,

Deputy Commissioner for Policy.

1993**

Presidential Documents

Title 3—

Proclamation 6624 of November 16, 1993

The President

National Farm-City Week, 1993

By the President of the United States of America

A Proclamation

The efficiency with which a nation produces and distributes its agricultural products largely determines the vitality, health, well-being, and economic strength of that nation. One of our Nation's great strengths is the tremendous productivity of its agricultural sector. The food and fiber that grow on our country's farms feed us, sustain us, and allow our Nation to thrive.

More than 20 million Americans—from farms to cities—are engaged in producing, processing, and marketing our agricultural supplies. They are a highly efficient team made up of farm families, people in rural communities, agribusiness industries, scientists, and retail distributors. This farm-city team is the most productive and effective in the world, demonstrating the strength and interdependence of our farms, rural areas, and cities in our economic system.

This remarkable farm-city system provides our people with produce for the smallest portion of consumers' average disposable income of any Nation. As consumers, we can use the remaining, much larger portion of our incomes for other goods, services, education, recreation, and comforts. This adds greatly to our choices in life and to our well-being, making us a more diversified, well-served people.

In addition, this farm-city team produces enough food in surplus of our own needs to enable the United States to be the breadbasket of the world, exporting more agricultural products than any other country. Each \$1 billion of farm exports provides an additional \$1.4 billion of off-farm economic activity and provides jobs for about 22,000 people on farms and in small towns and cities. Our highly competitive agricultural exports also provide the largest positive balance of trade of any U.S. industry. This, too, adds to our opportunities, our well-being, and the vitality of our economy.

Our agricultural team's unmatched productivity also makes it possible for the United States to carry out its international role as a world leader. As a strong, concerned Nation, with abundant agricultural reserves, the United States is the world's No. 1 donor of food aid in response to the needs of distressed people in other nations.

We all are indebted to the performance of the United States agricultural team. Each year since 1956, the Nation has set aside the week ending on Thanksgiving Day as "National Farm-City Week" to pay tribute to the people who put food on our tables and to give prayerful thanks for our individual blessings and the blessings of the United States of America.

NOW, THEREFORE, I, WILLIAM J. CLINTON, President of the United States of America, by virtue of the authority vested in me by the Constitution and laws of the United States, do hereby proclaim the week of November 19–25, 1993, as National Farm-City Week. I encourage all Americans, in rural and urban communities alike, to join in recognizing the accomplishments of our farmers and all those hardworking individuals who cooperate in producing the abundance of agricultural goods that strengthen and enrich the United States.

IN WITNESS WHEREOF, I have hereunto set my hand this sixteenth day of November, in the year of our Lord nineteen hundred and ninety-three, and of the Independence of the United States of America the two hundred and eighteenth.

William Clinton

Proclamation 6625 of November 17, 1993

Thanksgiving Day, 1993

By the President of the United States of America

A Proclamation

From the beginnings of our Nation, we have sought to recognize the providence and mercy of God with words and acts of gratitude, indeed with effort and energy toward helping others wherever need occurred. In the colorful days and weeks when the autumn of the year brings ripe and fruitful harvest across our land, Americans give thanks for many blessings. It is a time of bounty and generosity, a time to come together in peace.

This is the true spirit of Thanksgiving: acknowledging God's graciousness, and in response, reaching out in service to others. This spirit was apparent in Plymouth, Massachusetts, in 1621, when Pilgrim immigrants sat down with Native Americans and celebrated their common harvest.

This same spirit of Thanksgiving inspires our great Nation and our people to act with justice and concern toward all the peoples of the world and toward one another here at home. We are grateful for the dramatic progress made towards a comprehensive peace in the Middle East and for the Agreement signed in our United States; we are thankful for the relief efforts that our Nation and others have undertaken where natural disasters have struck unmercifully.

Still, in this final decade of the twentieth century, we face great challenges. The troubled areas of our world continue to challenge our ability to find peaceful and equitable solutions. On this Thanksgiving Day, the hospitality and harmony of loved ones, friends, and neighbors, remind each of us that we belong to the larger family of mankind.

As we gather together during this sacred and cherished time, let us pledge to build a new America where everyone will have a place at the table, and no one will be left out. In this way we will truly maintain the spirit of Thanksgiving that has enriched our country since its beginnings. While recognizing the importance of individual responsibility, we will continue to place the strength and benevolence of this great Nation at the service of all its people, indeed of all the peoples of the earth. Then, in these richer years, we will reap a true and fruitful harvest.

NOW, THEREFORE, I, WILLIAM J. CLINTON, President of the United States of America, by virtue of the authority vested in me by the Constitution and laws of the United States, do hereby proclaim Thursday, November 25, 1993, as a National Day of Thanksgiving. I encourage the citizens of this great Nation to gather in their homes, places of worship, or wherever they may choose to express heartfelt thanks for the abundance bestowed on us throughout our history.

IN WITNESS WHEREOF, I have hereunto set my hand this seventeenth day of November, in the year of our Lord nineteen hundred and ninety-three, and of the Independence of the United States of America the two hundred and eighteenth.

William Clinton

LIST OF PUBLIC LAWS

This is a continuing list of public bills from the current session of Congress which have become Federal laws. It may be used in conjunction with "PLUS" (Public Laws Update Service) on 202-523-6641. The text of laws is not published in the **Federal Register** but may be ordered in individual pamphlet form (referred to as "slip laws") from the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402 (phone, 202-512-2470).

H.R. 1308/P.L. 103-141

Religious Freedom Restoration Act of 1993 (Nov. 16, 1993; 107 Stat. 1488; 3 pages)

Last List November 16, 1993
